# Local Government in Uzbekistan

Rustamjon Urinboyev
University of Helsinki, Aleksanteri Institute, Helsinki, Finland
Department of Sociology of Law, Faculty of Social Sciences, Lund University, Lund, Sweden

## Synonyms

Decentralization in Uzbekistan; Local government in Central Asia; Public administration in Uzbekistan; Subnational government in Uzbekistan

## Introduction

Uzbekistan became an independent state in 1991 following the demise of the Soviet Union. Coming on the heels of a global discourse on good governance and decentralization, Uzbekistan embarked on the highly complex task of reforming its public administration system. The implementation of these reforms, however, proved to be a daunting task, since the country had to deal with its Soviet legacy and its internal power structures and contradictions: weak state institutions, poorly developed national identities, and entrenched subnational political networks (cf., Ilkhamov 2004; Markowitz 2008; Melvin 2004).

Local government is one of the most problematic areas in Uzbekistan where the failure of the reform initiatives is quite evident. This chapter delineates the processes involved and explores the context, problems, quality, and trajectories of local governance in Uzbekistan. More specifically, it addresses the following two questions: (a) What are the responsibilities of local governments and do they carry them out in an adequate and efficient manner? (b) How do local governments involve communities and their organizations in the governing process in terms of the

principles of good governance, such as transparency, accountability, rule of law, voice, democracy, and accountability? In doing so, the paper examines four conditions: contextual, structural, institutional, and human resource. These conditions are considered to be factors that can account for the capacity of local governments in Uzbekistan.

The rest of the chapter proceeds as follows: the next section describes the internal structure of local governments, which will be instructive in understanding the conditions under which they function in Uzbekistan. This is followed by the presentation of a brief overview of the tasks and service delivery responsibilities of local governments. The financial conditions and actual service delivery capacity of local governments are then discussed. The section after that examines the relations between the central and local government, followed by concluding remarks on the main trends and challenges local governments face. Suggestions on areas for governance reform are also provided.

## The Internal Structure of Local Governments

In Uzbekistan, the local government consists of a local state administration (administrative body) and an elected local council (legislative body) at the regional (oblast) and district (raion) levels. Representatives are appointed/elected for a period of 5 years. The local administration represents the executive and regulatory bodies of the state at the regional, district, or city/town levels and implements the policies of the president and central government in the provinces. All the heads of the local state administrations are appointed by the central government, subject to [symbolical] approval by the corresponding local councils (Bektemirov and Rahimov 2001). The president appoints regional (oblast level) governors, who in turn appoint district and city/town governors that come under regional subordination. Thus, the district and city governors are accountable to the regional governor, who in turn is accountable to the president. This means that local governors often experience double or even triple subordination, being accountable to the regional governor, the central government, and the president.

The local councils, running alongside the local state administrations, are the primary local legislative bodies. The council representatives are elected by the residents of the respective administrative-territorial units through general and direct vote (Bektemirov and Rahimov 2001). As elected bodies, the local councils are expected to express and realize the will of the citizens in their respective administrative-territorial units. At least in theory, local councils can exert some influence over their administrative bodies. However, this is not the case in practice as the heads of the local state administrations enjoy absolute power in the management of local affairs (e.g., Popa and Munteanu 2001). Since all the governors are appointed, the local councils cannot exert significant influence on them. Even though governors periodically report to their local councils on the current situation of the territory, this process is mainly symbolic in nature (Bektemirov and Rahimov 2001). This is because the governors of the regional, city, or district state administrations simultaneously exercise executive authority and serve as local council chairmen. This means it is very difficult to distinguish between the functions of the local state administration and the local self-government bodies, since the same individual (i.e., the governor) heads both branches of power.

In addition to the regional and district state administrations, there are sub-district level governance institutions – mahalla committees – in towns and rural areas. Mahalla committees were part of the state farms, collective farms, and enterprises during the Soviet era, but shortly after independence, Uzbek authorities revamped these institutions, assigning them new legal status as "local self-government bodies of citizens" (Giffen et al. 2005). Mahalla committees assist district/town administrations in implementing local development projects, collecting taxes, administering social welfare programs, maintaining and repairing roads, disposing of waste, ensuring security and order, removing garbage, maintaining playgrounds and sports fields, and many other tasks that are of local

importance (Bektemirov and Rahimov 2001; Urinboyev 2011). Regarding the financing and autonomy of these sub-district self-government institutions vis-a-vis the higher-level local state administrations, they are fully dependent on budget allocations from the latter and regularly report to the head of the district or city/town administrations. The chairmen and secretaries of the mahalla committees are salaried state officials. This means that mahalla committees do not have any real capacity to act as sites of local democracy and participation but merely serve as sub-district extensions of the local state administrations.

However, it should be noted that some form of informal autonomy can be observed at the level of the informal/social mahalla. Hence, there is a need to distinguish between the mahalla committees (administrative mahalla) and the informal mahallas (social mahalla). The Uzbek people usually refer to the chairmen of the mahalla committees as the "eyes and ears of the local government" ("quloq" in the Uzbek language), given the fact that they serve the interests of the local government. The leaders of the social mahallas, on the other hand, are elected by mahalla residents during informal gatherings in mosques or teahouses (guzar). They work pro bono for the community and represent the interests of the mahalla people. The social mahallas function informally and autonomously and can thus be regarded as a genuine citizen self-government institution (Urinboyev 2014, 2018). They offer a community-based alternative dispute resolution mechanism and provide a space for informal governance of everyday life and social relations. The analysis of scholarly literature shows that for many Uzbeks, social mahallas are more legitimate and easily accessible than the formal state institutions (Aminova and Jegers 2011; Masaru 2006; Sievers 2002; Urinboyev 2011, 2013a, b).

## Tasks and Service Delivery Responsibilities of Local Governments

The tasks decentralized to local governments in Uzbekistan include environmental protection, prevention of natural and technological accidents, fire protection, public sanitation, public order and security, local economic and social development, culture, tourism, sports, maintenance of leisure facilities, communal services (e.g., water, gas, electricity, heat, waste management, sewage, engineering infrastructures), construction, maintenance and local road repair, public transport, employment and job creation support, and the development of small and medium enterprises.

Almost all healthcare services are provided by the public authorities. The central government manages healthcare services through the regional, district, and city/town level healthcare offices of the Ministry of Health. Healthcare services are primarily financed by the central budget and administered by territorial structures of the respective ministry. The local government is only responsible for the maintenance and renovation of healthcare institutions (Bektemirov and Rahimov 2001). Schooling is the joint responsibility of the central and local government in the sense that the local offices of the Ministry of Education pay teachers' wages and oversee administrative control; other expenditures such as school maintenance are included in the local government budget (Bektemirov and Rahimov 2001).

Unlike Kazakhstan, Kyrgyzstan, and Tajikistan where local governments are responsible mainly for providing social assistance to needy families, the mahalla committees (administrative mahalla) in Uzbekistan are responsible for the administration and targeting of state social welfare benefits, such as child and maternity benefits, and social assistance to low-income families, families with children under 16, and single mothers with children under 2 (Coudouel and Marnie 1999; Micklewright and Marnie 2005). Funding for these programs is established centrally as part of the consolidated budget expenditures, which in turn are transferred to the mahalla committees. The remaining social protection programs (e.g., pensions, veterans of the war benefits) are the responsibility of the district/city level units of the Ministry of Labor and Social Protection (Bektemirov and Rahimov 2001).

## Financial Conditions and Actual Service Delivery Capacity of Local Governments

One of the most important criteria used by the citizens to assess the performance of local governments is the quality and accessibility of local public services (Popa and Munteanu 2001). However, there are only a few studies with data on citizens' satisfaction with local government performance in Uzbekistan. This is because Uzbekistan has long been a heavily authoritarian and closed country, making it difficult for local and foreign organizations and researchers to evaluate the performance and effectiveness of the local government in the country. Neema Noori's (2006) study of decentralization processes in Uzbekistan is one of the few in this respect. As Noori argues, decentralization has had a negative impact on public service delivery in Uzbekistan because it was not accompanied by the corresponding resources and consequently worsened the quality and accessibility of public services. Hence, the central government has delegated numerous tasks and service delivery responsibilities to the local governments without providing adequate funding (Kandiyoti 2007; Noori 2006). One of the key challenges to improve the performance of local governments in Uzbekistan is to bridge the gap between their economic and social functions and the meagre financial means available for their implementation.

The healthcare provision situation is also problematic. In Uzbekistan, the healthcare system is financed by the state, which means medical services should be free of charge. However, the healthcare system is de facto private and highly reliant on informal forms of financing. Most patients have to make informal payments to medical professionals in order to receive proper medical treatment, even though the public authorities claim that citizens are entitled to free medical care. Local governments do not have sufficient resources to maintain adequately the healthcare infrastructures, the majority of which were built during the Soviet period.

A similar situation can also be observed in the field of education. Due to their vulnerable financial situation, local governments do not have sufficient resources to maintain local schools and provide an adequate number of books or to build modern sports facilities. The parents usually cover these expenditures.

These problems can be largely explained by the fact that the local governments in Uzbekistan have limited financial autonomy and are strongly dependent on the central government (Ergashev et al. 2006; Sievers 2002; Urinboyev 2015). Local budgets mainly consist of transfers from the central government and local tax revenues. Local budget planning is centralized and closely tied to the national budget. This implies that central government bodies determined the revenue bases of the local budgets. The local governments cannot independently establish tax rates or collect their own revenues through local taxes, with the exception of some insignificant local fees, taxes, and duties, such as a land tax. National budget funds are redistributed among different regions by deducting budget surpluses from the regions that perform well and making allocations in the form of subventions, subsidies, or equalization transfers to vulnerable regions that cannot cover their needs. The revenues collected from local taxes constitute a small portion of the local governments' revenues and are insufficient for covering even the basic expenses. Hence, the ability of local governments to raise their own revenues is considerably limited, and they remain dependent on transfers from the central government to fulfill their service delivery functions. Consequently, they neither enjoy fiscal autonomy nor do they receive transfers from the central government that are sufficient to meet their service delivery needs (Leschenko and Troschke 2006).

Due to the incapacity of the local government to address adequately the local needs, social mahallas have evolved to respond to the declining state capacity in the post-Soviet era, acting as a pseudo-local government entity. This means that people living in the same neighborhood (mahalla) pool their efforts and engage in mutual aid practices by exchanging labor, money, material goods, and services. Typical mutual aid practices include the community financing of constructing irrigation facilities, cleaning streets, asphalting roads,

building houses or mosques, organizing weddings, funerals and circumcision feasts, and many other services not provided by the local government.

## The Relations Between the Central and Local Government

The local government in Uzbekistan functions in a rather complex environment characterized by an authoritarian political culture, limited financial autonomy, and weak local legislative bodies. The power and functions between the central state agencies and local governments are ambiguously distributed, which largely derives from the deficiencies in national laws that do not clearly specify the functions and powers across various tiers of the government. The central government bodies make most of the administrative decisions concerning district and regional public service delivery issues. In these bodies, a hierarchy of power starts at the ministry, followed by the ministry's main regional departments, and followed by the district or city units. Ministries control the daily activities of their territorial agencies and directly appoint their heads, in coordination with the governor, which implies that the territorial units of the ministries are accountable to their central bodies and thereby rarely coordinate with local governments.

Local councils, despite having official status as local legislative bodies, are in practice subordinated to the local state administrations. Hence, institutions of self-governance fulfill completely different functions and aims than the officially declared ones. This means that there is very little or no understanding of the true essence of local government reform in the country. As Abdukhalilov (2007) notes, in Uzbekistan, administrative reforms are often understood as a cutback in staff or an attempt to save money. More importantly, administrative reforms do not contain a single paragraph about the necessity to change the hierarchical norms and mentality of the managers.

Accordingly, Uzbekistan's public administration system can hardly be regarded as "decentralized" given that local governments are highly dependent on the central government at all levels – administratively, financially, and politically. Overdependence on the central government limits the ability of local governments to support local development. The malfunctioning local governments are mainly the outcome of a centralized government that does not delegate any real autonomy to local administrations (Bektemirov and Rahimov 2001). Under these circumstances political and civil servants at all levels do not feel any accountability to the citizens; rather, they try to meet the expectations of those who have the power and authority to hire them. Public participation in local politics is almost nonexistent, and local elections are merely used to assert and legitimize the central government's influence in the periphery. Openness and transparency are not viewed as a norm in the day-to-day operations of the local administrations. Local government officials care less about informing people about their work or listening to their opinions on the level and quality of public services. They are chiefly concerned with fulfilling the orders and expectations of the central government.

## Concluding Remarks

As shown in the previous sections, the relationship between the local state administrations and the central government is often based on subordinate relations rather than on mutual cooperation. Local government reform is interpreted merely in terms of citizens' active participation in local government, but other key conditions for local self-government (i.e., autonomy of local self-government structures from the state) are largely neglected (Ilkhamov 2004; Urinboyev 2015). As the results demonstrate, the core challenge hindering local government reform in Uzbekistan comes from the persistence of authoritarian style administrative practices. Although there have been some local government reform initiatives in the country, they remain "on paper" and have little or no effect on the governance processes. In practice, the local governments continue to be subordinated to the central government in all public policy issues, be

it education, taxation, health care, welfare, or agriculture. As a result, the local governments do not have any real capacity to adequately address the needs and concerns of citizens, as they are merely concerned with implementing centrally designed policies.

Another area of concern is financial autonomy. Since the local governments do not have a solid financial base and the important public policy decisions are made at the central government level, there is little or no possibility at the local level for citizens to voice their concerns about public goods and services. One visible consequence is the emergence of citizens' alternatives: informal coping strategies that are based on mutual aid practices. These alternative strategies are short-term solutions that have little to do with local development issues and negatively influence the image and legitimacy of the central government. It is thus suggested that local government reform should go beyond official proclamations and rhetoric and grant more political and financial autonomy in practice.

# Local Government Investment Pools

Julius A. Nukpezah
Department of Political Science and Public Administration, Mississippi State University, Starkville, MS, USA

## Synonyms

County investment pools; Joint investment pools; Joint investment trust; Liquid asset fund; Local agency investment fund; Pooled money portfolio; Public agency investment trust; Public deposit investment pools

## Definition

Local government investment pools (LGIPs) are cash management tools that operate within state boundaries and combine available funds from participating governments for investment in short-term securities with each investor receiving a prorated return based on their net assets in the fund.

## Introduction

As cash management innovation in the states, LGIPs use short-term securities in its investment strategy so they can allocate earnings to their investors daily. Although LGIPs are similar to money market mutual funds (MMMFs) and do not have the credit backing of Federal Deposit Insurance Corporation (FDIC), there are differences. While MMMFs are for pooling investment cash from private sector individuals, businesses, corporations, and political entities, LGIPs receive deposits only from governmental units within the states where they operate, which makes them a unique type of MMMF.

Whereas the federal government regulates the MMMFs through Securities and Exchange Commission (SEC), it is not mandatory for LGIPs to submit to these regulations. Like the MMMFs, however, LGIPs seek to maintain a net asset value of $1.00 per share with a penny variation on either side, although recent Government Accounting Standard Board (GASB) statement now allow shares to float in either direction in the allocation of gains and losses to investors. To ensure their safety and liquidity, LGIPs use short-term securities, such as US Treasury Bills. They also invest in certificates of deposit (CDs), corporate commercial papers, Banker's Acceptance, repurchase agreements, and other short-term securities that state laws allow.

In the more than four decades since their creation, LGIPs have become the cash management tool of choice for local governments because they are managed prudently by skilled fund managers

who seek to mitigate investment risks for their depositors (Bland et al. 2015). This article provides a detailed overview of LGIPs, which includes their benefits and their adoption across the states. The article also covers the demand and supply of cash to the LGIPs. Lastly, it discusses their inherent risks, strategies to keep them safe, and how they are organized.

## Benefits of LGIPs

LGIPs have several advantages for local cash investments.

1. LGIPs offer economies of scale to political units in a state by pooling and investing their available cash (Thompson and Gates 1988), which provide cost savings on administrative charges and reduce the cost of investing, especially for smaller local governments. By pooling their investment cash, LGIPs have higher bargaining power in the marketplace that enables them to negotiate terms for their investments and bid on larger investment portfolios that attract higher returns.
2. LGIPs provide small governments with access to professional management services. This is because LGIPs employ skilled technical staff or contract out the management of investment funds to professional money managers. Smaller governments that do not have the financial resources to hire experienced fund managers with experience in national and international investment trading benefit by pooling resources with other depositors.
3. LGIPs offer cash and investment services that are liquid and operate like depositories for local governments. The fund deposits are on call, and in most cases, are available for withdrawal whenever they are needed. The high liquidity of the funds is convenient for local governments who may want to keep their cash invested until they are needed for the execution of their public policies.
4. LGIPs offer more diversified portfolios, which decrease the risks of investment losses due to market changes and defaults by issuers of securities. By diversifying, LGIPs improve their cash flows without resorting to lower yielding investments with short maturities.
5. LGIPs operate only within state boundaries and are tailored to the needs of political units within a state, and by law utilize only securities that are on the legal list approved by the state for their investment portfolios. This means governmental units investing need not be concerned about whether their investment choices comply with state regulation, as they would be if they were investing with fund managers outside the state.
6. Federal laws do not require LGIPs to follow SEC and the Investment Company Act of 1940 regulations because they operate only within state boundaries and are subject only to state laws. This allows LGIPs to tailor their investment policies to the needs of local governments within their states. LGIPs, therefore, offer a more appropriate alternative for local governments seeking to invest their cash reserves than MMMFs that operate nationally (Bland et al. 2015).
7. Local governments that invest with LGIPs benefit from other cooperative arrangements such as access to innovations in treasury management and share risk with other governments.

## Adoption and Spread of LGIPs

Approval for the creation of LGIPs originates from state legislatures who grant statutory authority for agencies of state and local governments to organize LGIPs. Usually, the state treasurer's office is given the authority to create such a fund. In other cases, a state-approved interlocal agreement is enacted allowing political units in a state to commingle their cash resources for investment. In all, 44 states have adopted LGIPs as an investment vehicle for their state agencies and local governments. Following Connecticut's adoption of an LGIP in 1972, Montana, Oregon (1973), Illinois and Utah (1974) followed in that order. By the end of the 1970s, 12 states had LGIPs in place.

The 1980s reported the most adoptions with 20 states opting for LGIPs. This high rate of adoption is due to the high interest rates in the money market. The 1980s also marked the beginning of the New Public Management ideas and the rise of public entrepreneurship that encouraged market techniques in government management (Osborne and Gaebler 1992). In the 1990s, ten states adopted LGIPs, bringing the number to 42. The last two states to adopt were Indiana and Rhode Island, who did so in 2007 and 2011, respectively. Public finance literature in the 1990s hailed entrepreneurial public managers for raising revenues through investment incomes to address local revenue challenges (Kearns 1995; Klein et al. 2010; Chapman 1996).

Conditions in the internal and external environment of a state collectively influence the likelihood of states adopting an LGIP. A panel data analysis of the determinants of the adoption of LGIPs from 1972 to 2011 indicates that states whose neighbors adopt LGIPs in a given year are more likely to do so in subsequent years. Also, states with more opportunities for collaboration (as in their political fragmentation) and commitment to interlocal cooperation (assessed with interlocal expenditures) increase their likelihood of adopting an LGIP (Nukpezah 2018a). This particular finding extends the scholarship on interlocal cooperation and shows that local governments recognize the benefits of joint investments.

Currently, there are more than 90,000 local governments in the United States making the country very fragmented. The number of local governments in each state has varied across the states and over time. Hawaii has the least number of local governments, which increased from 20 in 1972 to 22 currently. Other states with fewer numbers of local governments include Rhode Island (134), Alaska (178), and Nevada (192). On the other hand, the most fragmented states are Illinois (6,964), Texas (5,148), Pennsylvania (4,898), and California (4,426). Those states with more local governments most likely have more opportunities for commingling their fund for investing.

Furthermore, financial and economic conditions of a state also contribute to the adoption of LGIPs. Generally, states that report higher fiscal health were more likely to adopt an LGIP in a given year. Specifically, states that report higher employment rates, higher revenues (as in local tax, property tax, own source, and intergovernmental revenues), and higher expenditure on financial administration report a higher likelihood of adopting an LGIP. This is because greater revenue efforts increase the incentive to invest and lower transaction costs for joint investments (Nukpezah 2018a).

The adoption of LGIPs across the states demonstrates that states are rational in their policy choices and are responsive to the needs of their local governments to be competitive with their cash management practices aimed at adding value to taxpayers' money. The adoption patterns also show that states recognize the opportunities in their environment given the financial and economic well-being of local governments in their jurisdiction and make choices to reflect that. Lastly, it affirms the influence of the policy environment, that is, a state's neighbors are essential to its adoption of innovations.

## Demand and Supply of Cash to LGIPs

The LGIP markets operate in 44 states, which provide the opportunity for suppliers and demanders of investment cash to interact. While all the political units (e.g., counties, cities, school districts, special districts, and other agencies) in states that have LGIPs are potential suppliers of investment cash to the LGIPs, the LGIPs demand cash for investment on the promise of offering better returns in the form of investment incomes. Some states (e.g., California) comingle funds from local governments and state agencies while others (e.g., Louisiana) separate these funds.

Supply of cash by local governments (participation in the LGIPs) has grown steadily over the last 46 years. In 1991, 15,286 government units supplied more than $45.4 billion to the LGIPs (Cook and Duffield 1993). A study

conducted in 2016 of LGIPs revealed that there were more than 27,300 government depositor accounts in 23 LGIPs from 23 states (Nukpezah and Bland 2017). A conservative estimate suggests there are more than 165 LGIPs with a net asset of more than $300 billion as of 2016 (Nukpezah and Bland 2017). Evidence further reveals that factors influencing the supply of investment cash to the LGIPs include local tax revenues, particularly sales and property tax (Modlin and Stewart 2013). Local governments that report higher fiscal resources are more likely to use LGIPs for managing their cash resources.

Depositor demand for LGIP services, on the other hand, is influenced by the safety, liquidity, and confidence in the management of the LGIPs (Bland et al. 2015). Moreover, increasing the number of LGIPs operating in a state result in a cumulative increase in demand for the services LGIPs offer (Nukpezah and Bland 2017). That is to say, those states that have more LGIP service providers report more local government users of LGIPs compared to those states that operate a monopoly market. Multiple LGIP service providers in a state increase participation in these pools because of the benefits of competition it grants to depositors (Nukpezah 2018b).

## Risks and Challenges of LGIPs

Like all investments, there are possibilities of losses when investing with the LGIPs. Investors with funds deposited in LGIPs lose direct control of their cash and have to go with the securities that the LGIP management decides to use and comply with their investment policies and strategies. There could also be managerial incompetence, lax supervision, and inadequate oversight of the funds that lead to risky choices and investment losses. The risks of investing in LGIPs include default, credit, liquidity, and market risks.

Default risk leads to investment losses due to the issuer's inability to honor the repayment of interests, the principal, or both. Credit risk occurs when some of the securities in an LGIP's portfolio lose value due to a dropping of the security's credit quality. When credit risk makes it difficult to sell a security, it leads to the increased illiquidity of the LGIP fund – liquidity risk. Market risk occurs when the Federal Reserve changes the federal funds rate, causing changes in other market interest rates. When the federal funds rate increases, an LGIP's portfolio loses value because its securities are yielding rates of return below what is now available in the market. The converse is also true.

Although experienced fund managers have the competence of averting risks, few LGIPs have incurred big losses because of the above risks. The major ones include the following:

- West Virginia Consolidated Investment Fund reported $279 million in losses on its investments in 1987 due to market risk and lax oversight, which led to the impeachment of the state treasurer by the House of Delegates and his resignation before the Senate hearing (Hayes 1999).
- Orange County Investment Pool, California, lost $1.7 billion in investments in 1994 due to default and market risks, which compelled the county to file for chapter ► "Organizational Structure and Crisis Management" bankruptcy protection.
- Texas Local Government Investment Pool (TexPool) experienced a run by fund depositors in 1995 due to an allegation that it was investing in risky derivatives, which led to a loss of more than $75 million in 1995 (Bunch 1999).
- State Investment Fund of Wisconsin lost $95 million due to poor investment oversight from the treasury department in 1995 (Lynch et al. 2002).
- Florida Local Government Investment Pool experienced a run by depositors due to the allegation that it was investing in sub-prime mortgage-backed securities, which led to a $1.1 billion loss in 2007.
- More recently, Illinois Metropolitan Investment Fund announced a $50.4 million loss, which they attributed to being victims of financial fraud in 2015.

## Strategies to Keep LGIPs Safe

Despite the losses, LGIPs are safe havens for depositing public funds by political units in their respective states. The high level of safety is also due to the increased regulation and the streamlining of requirements for investing public funds in the LGIPs across the American states. Strategies to keep LGIPs safe include the following:

- States require that LGIPs receiving public funds comply with three objectives for managing funds listed in order of priority as: (1) preservation and safety of principal; (2) liquidity; and (3) yield.
- LGIPs measure their performance and take appropriate actions. Performance may be measured with the pool's yield spread – the difference between the LGIP yield and a risk free rate – which also measures its risk premium (Bland et al. 2015; Nukpezah and Bland 2017). LGIPs reporting a higher yield spread have a higher risk premium.
- LGIPs maintain investment policies, which identify strategies for investment given its ability to mitigate the inherent risks. Some states make it mandatory for their LGIPs to receive ratings from a nationally accredited rating agency that vouches for the credibility of the fund. Rating agencies require transparency from the LGIPs in the way of investment disclosures of the fund managers' choices and daily reporting requirements. LGIPs that operate in 23 of the 44 states are rated.
- LGIPs may also self-censor, submit to SEC's Rule 2a-7 that regulates the investment industry, and operate with the highest possible rating although these are not required. Rating and compliance with Rule 2a-7 control investment managers' portfolio composition and investment strategies and thereby reduce the use of risky securities.
- LGIP portfolios maintain a weighted average maturity (WAM) of 60 days or less to ensure the liquidity of the fund. Moreover, the LGIPs limit investment in securities of nongovernment bond issuers to not more than 5% to limit the possibility of losses.
- LGIPs may also outsource the management of the fund to third-party investment fund managers to improve their efficiency and overall performance. This is often the case after a panic-related run on the LGIP to assure investors that the fund is under skilled professional managers (Bland et al. 2015).
- There is also mandatory training for fund managers to update their skills regularly in treasury management. Training focusses on understanding the legal list in fund managers' respective states and public funds investment laws, cash handling techniques, and the appropriate application of prudent person rule in investing.

## Organization of LGIPs

Regarding the organization of the LGIPs, there are two types: (1) state-sponsored LGIPs and (2) local government-sponsored LGIPs (interlocal agreement pools) (Nukpezah 2018b).

### State-Sponsored LGIPs

These are LGIPs sponsored by states to pool funds from all political units in their states for investing with each participant receiving a prorated benefit based on their shares in the investment fund. Thirty-two states have such pools, which are managed by the state treasurer's office, state investment boards, local government advisory councils, a third-party investment manager, or a combination thereof.

### Local Government Sponsored LGIPs

These LGIPs draw on state laws that permit interlocal agreements among local governments to commingle their cash reserves for investment purposes. This model uses a nonprofit corporation, such as a state municipal league, the trust department of a commercial bank, third-party investment manager, or a combination thereof to manage LGIP funds (National Association of Counties 2010). Although LGIPs may be

designed for pooling funds from all political units in a state, specialized pools include County Sponsored LGIPs and School District Sponsored LGIPs.

County sponsored LGIPs are the county versions of state-sponsored LGIPs, which pool funds from local governments within county boundaries for investment and are managed by the county treasurer. Although four states allow pooling by their counties (California, Nevada, Washington, and Michigan), California with 58 counties sponsored LGIPs is the state with most LGIPs in the country (National Association of Counties 2010). School boards and independent school districts, on the other hand, sponsor School District Sponsored LGIPs, for pooling funds from their members for investment with each receiving benefits based on their shares. Minnesota School District Liquid Asset Fund and Oklahoma Public School Asset Pool are exclusively for school district use.

## Conclusion

Although states that do not have LGIPs use alternative cash management practices that suit the needs of their local governments (Nukpezah and Abutabenjeh 2018), LGIPs have revolutionized state and local cash management practices in the United States. Before the 1970s, states and local governments held more than 40% of their assets in cash. This figure has declined significantly to less than 3% due to opportunities that LGIPs and other short-term investments provide to political entities (Bland et al. 2015; Mikesell 2011). These opportunities enable governments to raise extra income from tax revenues between their collection and disbursement thereby increasing value for taxpayers. LGIPs now constitute a multi-billion dollar industry and require attention from policymakers to ensure that they are managed prudently without compromising on their safety and liquidity. This will ensure that local governments receive the full benefit of their funds for the betterment of their governments and residents.

## Synonyms

Civic engagement; Local democracy; Local governance; Local politics

## Definitions

Conventionally, the size of a local government refers to the size of the population resident within its jurisdiction, though it may also refer to the size of its budget or its workforce. The optimum local government size has been a perennial object of scholarly concern, especially in terms of the implications of size for democracy and political participation. In this context, local democracy can be regarded as the attitudes, behaviors and institutions that underpin electoral and nonelectoral participation in local politics.

## Introduction

The size of local government has long been linked with the health of democracy. Since Aristotle argued that the civic friendship – upon which the common good depended – could not be achieved in cities with more than 100,000 citizens, theorists of participatory democracy have continually asserted that small is beautiful for efficacious engagement with politics and policy-making (Dahl 1967). The small is beautiful school has not however had it all its own way.

Again following Aristotle, the advocates of size point to the greater system capacity of larger governments which allow them to offer a broader range of services, perform their responsibilities to a higher standard and engage with weightier issues (Dahl and Tufte 1973). But also, at a time when participation is realized more through a panoply of sophisticated techniques and technologies than physical attendance at a public meeting (Dunleavy et al. 2006), larger governments may have an engagement advantage over their smaller neighbors. While lacking the close ties of small communities, larger governments might have a greater capacity to communicate policy and performance issues to citizens and also provide them with better opportunities to engage with the decision-making process. The chapter asks whether small is still beautiful or whether changes in the technology of engagement mean that big might be better?

## Small Is Beautiful?

The argument that small scale is better for local democracy stands on four legs. The first is focused on the relationship between citizens and a geographical place. "The small-is-beautiful school" suggests that "citizens are *locally orientated*" (Kelleher and Lowery 2009, p. 66). Dahl (1967, p. 954) argues that the spatial dimensions of a *polis* need to be "human, not colossal, the dimensions not of an empire but of a town." Small scale promises a knowledge of, and connection with, a specific place so that citizens, as Dahl (1967, p. 954) puts it, can know the "town… [and] its countryside about." Advocates of small-scale governance argue that citizens feel more efficacious in relation to the governance of the very local places to which they have an attachment simply by virtue of the greater stake they have in the future of those places. They further suggest

that citizens will be more interested by, and knowledgeable of, the "*smaller issues*" which are determined at this level of governance (Kelleher and Lowery 2009, p. 66).

Closely related to the attachment to a particular place and its issues, is the social attachment to the people associated with that place. A small scale of governance promises improved knowledge of and empathy for fellow citizens. "At its best," as Dahl (1967, p. 954) puts it, "citizenship would be close to friend-ship, close even to a kind of extended family, where human relations are intense rather than bland." In more theoretical terms, small numbers reduce heterogeneity and the associated costs of collective action by making it easier to communicate, develop shared values, and foster the sense of reciprocity, which underpin political efficacy, as well as sound governance (Farazmand 2004).

Third, small-scale governments offer a closer connection between citizens and their decision makers. "The essential point," again according to Dahl (1967, p. 957), "is that nothing can overcome the dismal fact that as the number of citizens increases the proportion who can participate directly in discussions with their top leaders must necessarily grow smaller and smaller." Importantly, in emphasizing access to "top leaders," Dahl discounts the democratic benefits of increased elected representation; irrespective of the ratio of citizens to representatives, the relational distance between "top leaders" and citizens increases with population size. Hence, the smaller the scale, the better will be the accessibility, responsiveness and accountability of governments. Kelleher and Lowery (2009, p. 64) explain that the problem is a collective action one in which: "Any act of participation by a citizen is less likely to influence outcomes on local public goods as the number of citizens within a city grows."

Fourth and finally, public choice theorists emphasize that in the interests of both public service efficiency and equity, small governments will be better able to offer bespoke policies and services to the local population. Assuming there is considerable variance in individual and community preferences, the larger the scale, the greater the divergence between the nature of citizens' demands and the supply of standard or one-size-fits-all government services. The smaller the population served by any one government, the closer the match between any one service and the preferences of its users/recipients/beneficiaries (Niskanen 1971). Where services are more closely matched to the preferences of citizens, so the argument goes, they might well be more satisfied with their government's performance and more inclined to feel that they are able to influence decisions (Kelleher and Lowery 2009).

Within the European and Australian context, empirical work largely supports the small is beautiful school (e.g., Drew and Dollery 2016; Hansen 2015) – a finding also confirmed in quasi-experimental studies of the impact of local government amalgamations (e.g., Lassen and Serritzlew 2011; Rodrigues and Meza forthcoming) – see Andrews et al. forthcoming, for a more complete review.

## But Could Big Be Better?

Although in many ways persuasive, the argument that small governments will necessarily be more participative can be turned on its head: it is just as plausible to argue that citizens will feel attachment to larger areas and bigger issues; that larger and more diverse populations will provide more opportunities for collective action; that larger areas will attract better and more communicative leaders; and that with the benefits of scale, larger governments will provide better services and therefore satisfy their citizens more. In terms of the logic of their arguments, at least, the relative merits of the "small is beautiful" and "large is lively" schools seem evenly matched. There is also some empirical support for the democratic benefits of size. Kelleher and Lowery (2009) furnish evidence of a positive relationship between size and voter registration and civic organization membership in the United States.

While the balance of evidence to date tips in favor of small over large governments, developments in the technology of engagement suggest that the relationship between size and democracy

may be changing. The case for small governments presumes that citizens participate though traditional political institutions where decisions are made by politicians and influenced by political processes – like voting and campaigning – that are hierarchical and episodic. But it is increasingly clear that public participation in local decision making is not always realized through the types of representative or direct democracy envisaged by advocates of small government. Traditional approaches to direct and representative democracy are fundamentally ill-suited to the challenge of governing the complex mass societies of the contemporary world, and technological solutions to overcoming obstacles to participation may therefore be required. Indeed, developments in information and communication technologies have now made it possible for citizens to participate in the business of government to an unprecedented scale and depth (Dunleavy et al. 2006).

The last few decades have seen a huge growth in the range of engagement techniques which promise participation without direct or representative democracy (at least in the traditional senses of those terms). Blomgren Bingham et al. (2005) describe a range of 'new governance processes' – including deliberative democracy, e-democracy, public conversations, participatory budgeting, citizen juries, study circles – as used across different levels of government in the USA. More formally constituted neighborhood, community or area forums – sometimes with delegated budgets and dedicated staff – have been established to assist the governance of particular services or to tackle problems of engrained deprivation across the world (Fung and Wright 2001).

Although all governments – whether large or small – can experiment with new forms of engagement, these developments are particularly germane to big governments. By introducing new participatory structures that reach out to citizens, larger governments may lessen the relational distance between citizens and key decision makers (Dahl 1967). New forms of citizen engagement may therefore represent a civic investment particularly appropriate to larger governments in that they might bring government closer to citizens in a way that can make them feel more informed about, and empowered to influence, decision-making. Furthermore, the new structures for public participation require considerable resources both for their administration in the narrow sense of the word, but also for the locally differentiated services and extended time lines that they are likely to demand (Blomgren Bingham et al. 2005). Larger governments may then have both a greater need but also a greater capacity to fund engagement initiatives.

While still tentative, research on the adoption of engagement initiatives by US local governments bears this out. Wang (2001, pp. 330–331) finds that "larger governments tend to have higher participation in service or management functions and decision making." A result that might be explained either by citizen desires to maintain a tighter grip of larger organizations or else "that large governments have more resources and capacities that can be used to enhance participation" (Wang 2001, p. 331). Finally – again based on US survey data – Jun and Bryer (2017, p. 851) find "the greater the organizational size and the greater the number of services provided by the municipal government, the more likely local governments will promote citizen participation in financial decision-making." Surveying both the literature and survey data from the UK, Andrews et al. (forthcoming) conclude that there is some evidence to suggest that the new forms of engagement might allow larger local governments to "overcome the burden of bigness."

## Conclusion

While the bulk of the evidence still supports the convention that small governments enjoy a democratic advantage over their larger cousins, there are signs that this might be changing. Developments in both the technology and form of citizen engagement might work to the advantage of larger governments which have both the resources and the inclination to engage with their citizens in different ways. Twenty-first century citizen engagement may not measure up to the ideals of

Athenian democracy but it might provide larger governments with the opportunity to redress the democratic deficit.

# Local Government Structural Reforms

Michael A. Tumanut
University of the Philippines Diliman, Quezon City, Philippines

## Synonyms

Administrative-territorial reform; Gerrymandering; Local government restructuring; Regional reform; State rescaling; Territorial reorganization; District creation

## Definition

Variegated reconfigurations on local government system, tier, number, size, or status.

## Introduction

Central to the study of local government structural reforms is the notion of subnational territory, the conceptualization of which is manifold: as invention, symbol, small world, or state apparatus. In politics and governance, subnational territories or local governments are creatures of the state, spaces of power, politics, and contention, and are breeding grounds for mindsets and cultures that influence political attitudes and outcomes. Local governments are also apparatuses to serve the overall goals of the state; reform on local borders, therefore, implies adjustment in approaches to achieving state goals. Accordingly, territorial reorganization is construed not only as mere reconfiguration of state machinery but also as a power-sharing mechanism, especially unfolding against the backdrop of democratization and decentralization (see Baldersheim and Rose 2010).

Shaped by history and tradition, many local governments serve as frontliners in service delivery and provide avenues for citizen participation. But, equally important, they are also spaces of economic production, investment, and regulation. In an era of

development agendas and search for alternatives, it is therefore fitting that fostering development – at national, regional, or local level, in any shape or form – also takes a territorial or spatial approach.

This entry defines and describes this phenomenon as well as attempts to summarize its features, processes, and underlying mechanisms.

## Typology, Context, and Motives

Prior to the 1980s when reform initiatives concerning local governments were first unbundled, subnational structural reform had long been lumped in the scholarship of public sector reform. Since then, several typologies of "local government reform" have been introduced, integrated, and reinterpreted as follows: functional, financial, organizational/management, jurisdictional, and structural (see Dollery et al. 2008). This entry focuses on the "structural" type of local government reform. It generally refers to *change on local government landscape, whether on system, tier, size, number, or status*. Local governments are broadly defined as substate, multipurpose entities or authorities in single-tiered (i.e., basic units) or multitiered system (e.g., with intermediate or submunicipal level, or both).

Structural reforms are diversely contoured as, inter alia, changes in number of local governments (through merger of contiguous units, or fragmentation), introduction of new tier (intermediate or sub-municipal), and improvement in unit status (e.g., from city to autonomous unit). These transformations are classified as: upscaling, downscaling, and transcaling (see Table 1). Discussion of boundary reform alongside proliferation of urban and intermediary cities and the ensuing agglomeration or corridor development are outside the scope of this entry.

Structural reform choice can slide across several continuums: between small and large units or between fragmentation and consolidation, between privatization and government expansion, or between centralization and decentralization (Kopric 2012).

*Framing and context*. Scholars differ in the framing of territorial reform: as means to achieve efficiency, response to spatial and demographic shifts, mechanism to dissipate politico-economic crises, or tool for democratization and accountability improvement. Some frame reforms using the lens of ideological or values imposition. The problems identified and arguments used for or against reform are diverse and context specific. For Leland and Thurmaier (2004), strong framing of problem through discourse is paramount to reform attempts.

**Local Government Structural Reforms, Table 1** Typology of local government structural reform

| Type | Manifestation |
|---|---|
| Upscaling | Consolidation (reducing number of units or creating larger single-tier municipalities); introduction of higher-order tier; regionalization; differentiation of legal status of units (e.g., improvement of status); hosting arrangement; regional policy structures |
| Downscaling | Fragmentation (creating new units); establishment of submunicipal entities |
| Transcaling | Loose agreements (e.g., intermunicipal cooperation, joint enterprises); contracting out |

Note: Reform types and examples are drawn from Baldersheim and Rose (2010), and Dollery and Robotti (2008)

The context of reform varies. For some, the frames of reference used include challenges induced by globalization, modernization, as well as influence of earlier reform experimentation, or by the ebb and flow of government service portfolio. Local attributes may also complicate reform. Reference to decentralization and democratization is a common frame, particularly among developing countries. Europeanization as a philosophy has been prevalent in Europe, which, for example, manifests in erecting structures to utilize regional funds. In Indonesia and India, territorial fragmentation was framed as corrective measure to address ethnic-related injustices.

*Motives.* In the systematic literature review of Karkin et al. (2019), motives for upscaling are mainly political/electoral, and pertain to upgrades on service delivery. Strengthening local democracy and structure are secondary motives, which may be complemented by presence of crisis-

trigger (e.g., disaster) or facilitated by policy transfer and institutional isomorphism. On the side of downscaling/fragmentation, opportunism, patronage, and power perpetuation have been observed alongside economic and pro-democracy motives; in others, reform is partly attributable to shifts in government type, political attitude, and beliefs system, as exhibited in Indonesia, India, and several Eastern European countries.

## Scholarship, Trends, and Reform Experiences

Various viewpoints have been employed in the study of structural reform: historical, economic, welfare state, post-functionalist, and institutionalism. Academic literature on upscaling is replete with theoretical models, comparative analyses, and country-specific evidences. Contrarily, downscaling, specifically fragmentation – the reform choice of many developing, democratizing and transitional countries – is an under-examined variant of structural reform, but is an emerging research theme.

*Europe.* Reform choice undulates to context, space, and time as evidenced by Europe. Despite Europeanization, the continent's variegated subnational government systems and structural transformations are notable. Central Eastern Europe has, in the past few decades, recorded significant increase in municipality number, but has recently slackened. Inversely, Western Europe has continuously contracted the number of municipalities to favor larger municipalities despite recent downturn in reform rate in general.

In the 1990s, following major political transformation, several Central Eastern European countries had reorganized their local governments in a "rapid and relatively short" manner; in some, restructuring was protracted (Swianiewicz 2010, p 183). Whereas, between 2012 and 2016, the municipal borders in this region (except for Albania) were almost unchanged (see Table 2), many have undergone series of fragmentation. Poland, Slovenia, and Hungary, for example, have for several decades reorganized, fragmented, or regionalized their subnational units. Though most of the region is touted as pro-democracy (i.e., pro-fragmentation), some pockets were pro-consolidation proponents, particularly the socialist countries after the Second World War and a few transitional countries in early 1990s (Kopric 2012).

Bigger municipalities, on the other hand, are preferred in Western Europe. Municipal consolidation has come in several waves in different parts of the region. Nordic municipalities have continuously shrunk in number since the beginning of the twenty-first century (see Table 3). This region has long been branded as pro-consolidation bloc. Although Sweden's local borders have remained stable this century, amalgamation was forceful and protracted in its reform agenda in the 1950s–1970s.

Between 2012 and 2018, most of Western-Southern Europe had continued contracting the number of their municipalities (see Table 4). The

Alpine countries (e.g., France, Switzerland, Italy), including Spain, have been labeled as "traditionalists" or those exhibiting little or slow reform, while the rest are old democracies that are pro-consolidation (Kopric 2012).

Contemporarily, Europe's municipal boundary reform in general has been incremental and sporadic. As for other reform choices, trends of regionalization and multilevel governance, since the 1950s, have been observed in European and other OECD countries (Hooghe et al. 2010). While there is an emerging literature that explores submunicipal units, a comparative literature is sparse (see Hlepas et al. 2018). Moreover, network creation, cooperative and hosting arrangements, and recentralization of services, among others, have become alternative solutions in a complex subnational landscape. In particular, intermunicipal cooperation has steadily gained ground across the world. These transcaling options are generally less intrusive.

*Africa*. Outside Eastern Europe, the regions of Africa, Latin America, and Southeast Asia exemplify the creation of new units through fragmentation (usually at the region or intermediate level).

Since 1990, the borders of Uganda's districts and South Africa's provinces are the most volatile in the continent, where a fourfold and twofold increase, respectively, in the number of first-tier units have been recorded. In others, structural reform has manifested in the introduction of new tier (e.g., in Burkina Faso, Ivory Coast, Morocco), dissolution/reorganization of first-order tier (e.g., provinces in Kenya, Madagascar), consolidation (e.g., Rwandan provinces, Moroccan districts), and renaming and fragmentation (e.g., Chad, Benin, Cameroon, Niger) or renaming and consolidation (e.g., Libya, Namibia). Borders of first-tier units have been inert in lusophone states (e.g., Angola, Mozambique, Sao Tome and Principe), and generally slower in North Africa. At large, fragmentation is a common reform choice in Africa (see Table 5).

*Southeast Asia.* New provinces have also proliferated alongside rapid urbanization in Southeast Asia. All countries (excluding Singapore and Brunei) have increased the number of their first-order units since 1990, with local borders of Vietnam, Malaysia, and Indonesia being most unstable (see Table 6). In the Philippines, change in legal status

[a]Below state level (1999–2019 data)

of independent cities has contributed to increase in province-level units. Despite the recent throng of new provinces, territorial splitting is continuously being proposed in this region.

*Latin America.* Similarly, municipal fragmentation or "atomization" has continuously pervaded government reform in Latin America (see Table 7), to complement ongoing decentralization reforms in some countries. In over two decades, Argentina doubled its number of municipalities. Brazil, Venezuela, and Paraguay also saw significant increases. In smaller countries (e.g., El Salvador, Costa Rica, Guyana, and Suriname), municipal borders remain unchanged. In some areas, municipal atomization was accompanied by other structural reform choices, such as introduction of second subnational tier in Uruguay in 2009, and establishment of regions and dissolution of departments in Peru in 2002.

*Rest of Asia-Pacific.* In other OECD-member countries outside Europe, consolidation has become permanent fixture in their reform agenda. Japan is the archetype of municipal amalgamation in this group, as it has witnessed three great waves of consolidation since the late nineteenth century. Reform rates in Canada and Australia vary by province/state, while in the United States, territorial reform is sporadic at the city–county level and is more pronounced among special-purpose entities. Many municipalities in New Zealand and South Korea have likewise amalgamated.

## Processes, Actors, and Mechanisms

Procedures, approaches, and "game rules" are dictated by formal rules (e.g., state constitutions, local government acts). To illustrate, periodic statute

**Local Government Structural Reforms, Table 8** Actors and incentives in territorial reform

| Actor | Collective goal | Selective goal |
|---|---|---|
| Ministry officials, special commissions, national legislators | Government leadership | Greater influence, political power, reelection |
| Elected local officials | Community leadership | Political power, reelection |
| Government employees | Public service | Job protection, greater autonomy |
| Chamber of commerce, merchants, media | Community image, status | Financial gain |
| Manufacturers, developers, contractors | Economic development | Financial gain |
| Civic groups | Accountability, good government | Status, prestige, membership |
| Academics, professional organizations | Progressive reform, good government | Influence, program expansion |
| Racial, ethnic minorities | Representation | Greater influence, government access |
| Homeowners associations; tax control groups | Lower taxes, greater access, efficiency | Lower individual taxes, exclusion |

Adapted from Feiock (2004), p 299

amendments in Japan have facilitated the reduction in the number of municipalities, a long-standing agenda of the central government. The "reform game" therefore may be tiered and nested: constitutional (i.e., game to change "reform game rules") and collective (i.e., actual game of reform at the subnational level) (Tumanut 2015).

Reform choices are formulated and attained using different approaches: political (top-down, bottom-up, or sandwich), technical (by bureau/ministry), or reliance on independent commission. Political expediency and vagueness in reform rules may trigger a top-down approach. Bottom-up approach, on the other hand, is characterized by initiative of elected local officials or residents. In some countries, legitimation through referendum is mandated by law (e.g., the Philippines); in others, referendum is only consultative (e.g., Japan). Master plans (including formal assessment of units) are drawn in some countries (e.g., South Korea). In some, consultation committees are established before authorities decide. From an institutional lens, reform game in some countries is multi-tiered and accordingly involves multiple actors, like in the Philippines where the constellation of veto players in the structural reform game is found to be large. In some countries, structural reform is a local affair and thus requires only a few veto points (e.g., the USA).

In short, rules and institutions can be analyzed at various levels (e.g., national or local, collective or individual) and forms (e.g., financial, political, electoral). As formal rules differ, so do the constellation of actors, and the incentives they face (see Table 8). Veto power or influence over reform

decisions, however, is not equally shared among actors.

From an institutional choice framework, territorial reform is a collective action problem, especially in bottom-up or sandwich approach. Policy entrepreneur, united elites, vertical coalition, and cohesion in actors' preferences have been described as mechanisms of successful reform. Similarly, opportunism (whether electoral, political or pecuniary) and reciprocity norm are common reform mechanisms in developing countries in the investigation of district creation.

Inherent in many reform procedures is the use of criteria. Geographical area and population, two of the commonly used criteria, are found to have association with number of jurisdictions and subnational tiers (Gomez-Reino and Martinez-Vasquez 2013). Viability assessment may also include sufficient revenue base, infrastructure level, or capacity vis-à-vis service portfolio. Others consider local identity, history, spatial scope of daily life, and terrestrial attributes.

## Conclusion

This entry described how local government structural reforms are pervasive, continuing, and variegated. It also summarized the diverse contexts, processes, actors, motives, and mechanisms in the "structural reform game."

Goal attainment of these reforms, however, has perplexed scholars. In the recent systematic literature reviews on territorial reform effects (e.g., Tavares 2018; Fox and Gurley 2006), evidences are mixed; in some, empirical findings are weak to support hypothesized effects on efficiency, expenditure, financial management, scale economies, customer satisfaction, service quality, or local democracy. Put differently, there is no guarantee that structural reforms will improve local governments in general. Such an uncertainty has stalled reform agenda in some areas and has also sparked debates to rescale or reverse reform efforts in others (e.g., demands for demerger in Canada).

Though complexity and ambiguity may characterize reform contexts and outcomes, the growing literature intends to aid authorities to better engineer reform agenda and strategies, as well as to manage expectations. The literature may also direct them to less radical and less intrusive alternatives in the structural reform portfolio.

## Definition

Local government is the government at the grass roots with a given population and constitutional power to elect officials for the administrative and regulatory functions in the local area.

## Introduction

Local government system in Nigeria has its antecedence in the pre-colonial era when each of the separate communities that make up today's Nigeria was administered in what has been variedly described by scholars as provincial, kingship, empires systems, etc. (Kirk-Greene 1965; Fadipe 1970; Afigbo 1972; Atanda 1973). However, some discussions take the colonial period as the inception. These pre-colonial systems of local governance were very simple but with variation from place to place. An attempt to account for this variation by Adewunmi and Egwurube (1985) led to four role categorizations which are executive/participatory, nonexecutive/participatory, strong-executive/participatory, and weak-executive/participatory systems. They argued that the Fulani emirate system typifies the strong-executive/participatory system while the confederate nature of the Yoruba kingship system represents the weak-executive/participatory system. But the unique type of traditional authority system in the Eastern region fell outside their executive/participatory classification, thereby typifying the nonexecutive/participatory system.

Though not all pre-colonial local government systems can appear to fall neatly in these executive/participatory roles categorization, Adewunmi and Egwrube's categorization is a remarkable attempt to conceptualize pre-colonial political system away from the common historical and narrative approach. However, with the advent of the European colonial system, these pre-colonial systems gave way to the Native Authority system which subsequently birthed the modern form of local government. Drawing on this pre-colonial antecedence, this chapter entry provides a trajectory description of the Nigerian local government system up to the recent introduction of the Local Council Development Areas (LCDAs).

## History of Local Government System in Nigeria

### Pre-Colonial Era

Local government system in Nigeria has its origin in the existing pre-colonial traditional systems and not in the Westminster system imposed upon the country (Bello-Imam 1996). Before the advent of British rule, Nigeria was not a single country with a central government as it is today; rather it was

made up of many independent states with varying but similar systems of government. For instance, in the Hausa/Fulani setting, the Emir was an almost absolute autocratic ruler; in the Yoruba setting, the Oba was more than a chief; he was a divine king and the personification of the whole town. Though the Obi was the most revered title in the Igbo society, his status was earned and not ascribed, and the governance of the village was by direct democracy (Uchendu 1965). So, it is plausible to assert that the traditional rulers performed legislative, executive, and judicial functions in the Hausa/Fulani and Yoruba communities in the pre-colonial era, whereas political power was largely fragmented among Igbo communities. The strength of these pre-colonial systems was what led the British Colonial government to utilize existing traditional institutions to penetrate the rural communities. These indigenous institutions owing nothing to European political concepts were the foundations upon which local government system in Nigeria was built.

## Colonial Era

With the penetration of colonial system in the year 1900, there were subtle changes to the system of local governance predominant during the pre-colonial era through the introduction of indirect rule. The machinery for the operation of the indirect rule by Lord Lugard was the native administration system. The Northern empires were the first recipient of the native administration system officially through the Native Revenue Proclamation No. 2 of 1906 (Kirk-Greene 1965). Consequently, the areas governed by the Emirs were converted to Native Authorities and constituted the first institutions of local government under the colonial era. The adoption in the North was an instant success because the people had been used to the absolute authority of their Emirs.

Given the successful implementation of the system in Northern Nigeria, the native administrative system was formally introduced in other kingdoms after the amalgamation of the northern and southern protectorates in 1914. Invariably, among the Yorubas, the leading Obas were designated sole native authorities. In the East, artificial, hardly indigenous warrant chiefs were created and given executive, legislative, and judicial powers in respective villages. But, because the system grossly misinterpreted the indigenous political organization, it did not survive long in the region (Adewunmi and Egwurube 1985). With the increasing relevance of the nationalists in the administration of the region, major strides were taken which brought about the birth of Local Government Ordinances in the eastern and western regions in 1950 and 1953, respectively. However, native administrative system continued to be relevant in the northern region beyond 1960.

## Postcolonial Era

The last decade of the colonial era witnessed a gradual transfer of political power and authority from the traditional rulers to the nationalist politicians who had started to assume de facto superior powers in all matters concerning governance of the people. On attainment of independence in 1960, traditional rulers had become mere appendages of the politicians or parliamentary enactments.

With the introduction of competitive party and election of public officers into the local level, conciliar impersonal structures of local government were introduced to replace the existing personal autocratic system. By this democratization of local government councils, traditional rulers in the northern region who had hitherto continued to exert tremendous control started to lose control at a very rapid rate. Even more rapidly, the warrant chiefs in the eastern region had become increasingly unpopular as the Igbos could be considered to have set the pace of democratization of local government as early as 1950. So, during the first republic after independence, the power to appoint, remunerate, discipline, and remove traditional rulers was transferred to local government councils. This system remained until the military coup of 1966. After the dissolution of the local government, a search for a uniform approach to local governance started. Eventually, the nationwide cross-fertilization of ideas that started in the year 1969 culminated into the landmark reform of 1976.

## Local Government Reforms in Nigeria

### 1976 Local Government Reforms

The 1976 reform marked unique historical changes in local government administration in Nigeria in many respects. The reform was part of the government's response to the Udoji Public Service Review Commission recommendations. In order to make local government more effective, the reform introduced a new pattern of the intergovernmental relationship which brought the federal government into direct contact with local government authorities. The reform was the most radical and far-reaching policy solution for devolution of power to local government by establishing a multipurpose single-tier local government system all over Nigeria with uniform structure and functions. Thus, the 1979 Constitution recognized it as the third tier of government within the federal system.

The uniformity of the reform can be conceptualized in terms of the functions and duties of all the local governments. The administrative and political structures of local government were the same throughout the country. Chairman was elected in every local government council to head the council. In addition, they were organized on departmental basis. The experience between 1976 and 1979 when the new constitution became operational showed that some significant achievements had been recorded by local governments in various parts of the country.

As remarkable as the 1976 reform seemed, it was not without its own defects. For instance, Nigeria, a federal state opting for a uniform system of local government, appeared to be defeating the very essence of federalism which is to let each state decide its own organization (Daloz 1989). The standardization, as it is with the 1976 reform, is the attribute of unitary system of government and not federal system of government. Also, the 1979 Constitution, by allowing states to make laws creating local governments, allowed for the abuse which the system experienced under many state governments in the Second Republic. In the light of all these, it was only a matter of time before the structuring principles of the local government became due for another review in 1984.

### Dasuki-Led Reform Committee

The military, upon taking over the seat of power in 1983, introduced a sole administrator system as an interim stop-gap modification to reorient the local government system. Given that the sole administrator system was not intended to replace the 1976 local government reforms, a 21-man committee was constituted in 1984 under the chairmanship of Alhaji Ibrahim Dasuki to review the 1976 reforms.

The Dasuki-led committee started its exercise by reviewing the problems that plagued the local governments during the previous administration. The major problem identified was the proliferation of unviable local government councils; adequate preparation was not done before their creation, and consequently, their creation engineered an endless demand for further creation. The committee concluded that nothing was wrong with the number of local governments being 301, that rather the problem was the handlers of the system. The committee was concerned with issues of boundary adjustments, lack of geographical contiguity, and the dichotomy of development focus. As a result, it recommended the following with regard to standard structure of a local government: (a) a minimum population of between 100,000 and 150,000, (b) a minimum tax paying population of 20,000, (c) traditional association and wishes of the community in the areas, (d) ability to generate internally at least 50% of the revenue required to fund its annual recurrent expenditure, and (e) administrative convenience.

The committee also introduced the concept of management audit as a new innovation in the management of finances in local governments. As an incentive for accountability and prudence, the committee introduced the "council of the year award" initiative. These recommendations were accepted by the federal military government. The Dasuki-led committee identified the challenge of the local government to raise enough internally generated revenue and as such recommended that the tax collection strategy

of local government should be revamped. To aid this, it recommended that persons should be compelled to register according to their local government.

The committee also deliberated on the condition of service and the quality of staff at the local government councils and recommended comprehensive training programs which were to be undertaken in three Nigerian universities: University of Ife, Ahmadu Bello University, and University of Nigeria, Nsukka. It also recommended that funding should be sourced by setting aside 2.5% of the total personnel emolument vote of each local government. The government accepted this recommendation and directed the state governments to commence preliminary training programs in local governments for their staff. Concerned also about the role of traditional rulers, the committee recommended the establishment of an emirate/traditional council which will be saddled with the monitoring of appointment, removal, and disposition of traditional rulers to curb the tide of politically motivated appointments and removals. The government accepted this recommendation.

### Babangida-Led Reforms

Most of the reforms initiated under the Babangida military regime were predicated on the report of the Political Bureau set up in 1986 and the Dasuki Committee report of 1984. The Political Bureau headed by Dr. Samuel Joseph Cookey had a mandate to review the political history of Nigeria and identify the causes of the failure of democratic institutions. After a thorough analysis of the country's political history, the Bureau recommended a presidential system of government with corresponding constitutional democracy and a socialist system where the state shall be the commanding height of national economy.

The most changes made in the system of local government under Babangida regime drew insight from these recommendations. The only area where the government distanced itself from the Bureau was on the issue of socialism. Besides, Babangida administration committed itself to ensure that the populace at the grass roots participated fully in governance by devolving more responsibilities to the local government and allowing them some autonomy to function effectively as the third tier of government. Therefore, the reforms were planned to lay the economic and political foundation for grass roots-oriented development.

## Creation of New Local Government Areas (LGAs) in Nigeria

In 1987, Babangida's administration tinkered with the federal structure by increasing the LGAs from the existing 301 to 449 LGAs, and later on August 27, 1991, he increased it to 500 LGAs, only to create 89 new LGAs on September 23 of the same year, bringing the number to staggering 589 LGAs by the end of that year. Likewise, Abacha who took over from the interim government of Ernest Shonekan in 1993 initially increased the number of LGAs from the existing 589 to 593 LGAs in 1995 and a year later increased further to a staggering 704 LGAs.

With the emergence of the fourth republic in 1999, the persistent outcry for the creation of more local government areas became more noticeable to the extent that by 2003, not less than 500 local government areas were either in the process of creation or have been created by a number of state governments in Nigeria. The attempts to create new local government areas by state governments were initially unsuccessful, resulting in cancelation. This inability of state governments to successfully create new local government was majorly attributed to the ambiguity of the 1999 constitution.

## The LCDA Era: Lagos State as Pacesetter

In agreement with Section 7(1) and Section 3(6) of the 1999 Constitution of Nigeria which gives state governments the power to establish local governments (Federal Republic of Nigeria 1999), most states through their respective Houses of Assembly enact laws to provide legal backings for the new LCDAs. In the instance of

Lagos State, the 37 new local government areas (later renamed Local Council Development Areas) were established by the creation of New Local Government Areas Law No 5 of 2002, as amended by the creation of New Local Government Areas (Amendment) Law No 15 of 2004, as further amended by the creation of New Local Government Areas (Amendment) Law No 2 of 2005.

However, the constitution further qualifies the power given to the state government by satisfying the provisions of Section 8(3) and (4) which provides for a bill to be passed to the effect of the creation through the instrumentality of the State House of Assembly after a statewide referendum has been conducted. In compliance with these provisions, the Lagos State Independent Electoral Commission (LASIEC) conducted the statewide referendum on the creation of the new 37 LGAs on May 21, 2002, which witnessed overwhelming support for the creation of the LGAs. As a result, the state assembly passed the resolution of the referendum into law.

While Sections 7(1) and 8(3) and (4), respectively, are in harmony with the spirit of federalism by protecting the separate organization and quasi-sovereignty power of other federating units, the provisions of Section 3(6) and Part 1 of the First Schedule which list the number of existing LGAs hamper this separate organization and quasi-sovereignty, making it appear as though no further LGA outside the ones in existence is recognized by the constitution.

However, in a bid to solve the inconsistency, the Constitution went further in Section 8(5) requiring the National Assembly to make substantial provisions by Act with reference to the names and headquarters of the new LGAs. In order to enable the National House of Assembly to perform this function, Section 8(6) required the State House of Assembly after the creation of the new LGAs to make adequate returns to the National Assembly. This provision, however, became the basis for a legal tussle over the constitutionality of the new 37 LCDAs between Lagos State and Federal Government. The case settled once and for all the powers of the state governments to create additional local government areas. However, it is expected that the State Assemblies will apply to the National Assemblies to ratify the creation and subsequently list them in the constitution for federation recognition.

## Conclusion

Despite the many reforms that have been affected in the administration of local government system in the country, there is still agitation over the best system to adopt for local governance in Nigeria. Controversies still arise with respect to revenue sharing and fiscal relations among the three levels of government. The agitations for local government reforms are an important part of the recent demands for the restructuring of the federal system in the country.

## Local Government Under Austerity, Narrowing the Accountability Landscape in England

Laurence Ferry[1] and Peter Murphy[2]
[1]Durham University Business School, Stockton on Tees, UK
[2]Nottingham Business School, Nottingham, UK

### Synonyms

Answerability; Culpability; Economy; Liability; Responsibility; Self-denial

### Definition

Accountability is an obligation to provide an account to someone with a legitimate interest. Its historic origins were formalized through the practice of bookkeeping and the discipline of accounting. Public accountability is considered to be a cornerstone of modern democracy.

Austerity, as experienced by the UK economy since 2010, is a form of government-induced deflation in which the economy adjusts through the reduction of wages, prices, and public spending to restore competitiveness, which is, allegedly, best achieved through cutting the state's budget, debts, and deficits.

### Introduction

This is a descriptive review of legislative, policy, and organizational developments in English local government between 2010 and 2015. Under the Conservative-led Coalition government, accountability and transparency arrangements were subject to significant change.

This entry begins with a discussion of the literature on accountability and transparency and what this means for public management, before contextualizing it to local government in England. It suggests five themes that may also be relevant for policy makers and practitioners before drawing some generalized conclusions.

One question often raised is whether accountability and transparency are the same thing, support one another or can undermine one another. Hood (2010) refers to this as "Siamese twins, matching parts and awkward couple."

Accountability is an obligation to provide an account to someone with a legitimate interest. It involves a counting of possessions and the classifying of information on the basis of norms and conventions. Its historic origins were therefore formalized through the practice of bookkeeping and the discipline of accounting (Bovens et al. 2014). For the public services in the UK, the formalization of accountability was initially manifested through accounting as an assessment by an audit (financial conformance). More recently, the accounting aspect of assessment has been further formalized through detailed performance management arrangements (operational performance) and ever expanding regulation as bodies that perform assessment increasingly cover every aspect of accountability from health and safety to equality, etc. (Power 1997). This expanding remit has been championed for strengthening accountability (Campbell-Smith 2008; Audit Commission 2009), but while it has had benefits, there have also been negative effects (Downe et al. 2010; Martin et al. 2013). This includes a challenge on cost grounds and whether it provides overall value for money.

In contrast to accountability, transparency champions openness as a means to prevent abuses of power, which has had a strong influence on democratic governance (Bovens et al. 2014). Initially, transparency was formalized in the UK

public services through an opening up of archives, making minutes publicly available, and unlocking meetings for public attendance. This was to make information, data, and discussion more open, visible, and free as part of transparency processes that support accountability. In recent decades, tranparency in the UK and elsewhere has increased through the Freedom of Information Act and other initiatives and especially following the opportunities to share data and meetings online through the internet and e-government where there has been an exponential increase in data availability.

Over recent decades, in order to facilitate accountability, various governments have brought in significant performance management frameworks and thereby accumulated more information about how subnational levels of government are operating. However, as governments have emphasized some aspects of performance management, such as building measurement systems to acquire more performance data, they have sometimes neglected wider organizational change that would facilitate the use of such information at the implementation level (Ferry et al. 2017).

Since the early 1980s, successive UK governments have also supplemented financial controls, through audit for financial conformance, with a range of centralized performance management frameworks that set out how local government should operate and what they should focus on. The performance of individual local authorities were monitored against these frameworks through a comprehensive system of indicators and external audit and inspection, in order to try and create a "golden thread" that linked ministerial objectives and pronouncements with the administration of policy at the local level. These initiatives sought to facilitate the continuous improvement of public services and assess this improvement through the "economy, efficiency, and effectiveness" with which local authorities delivered services – with these values for money, objectives were reflected in performance frameworks and indicators.

In contrast, since 2010, the Government has embraced a policy of "austerity localism" (Lowndes and Pratchett 2012) and undertaken governing and budgeting for deficit reduction through changes to the spending review, budget, and audit and accountability arrangements (Ferry and Eckersley 2015). For example, reforms such as the Localism Act 2011 have given local authorities greater autonomy over spending decisions but not local revenue generation. Other changes have seen the abolition of the Audit Commission, which previously coordinated and delivered external audit, inspection, and national reports on locally delivered public services in the UK (Timmins and Gash 2014) and the abandonment of performance management frameworks and performance audit that has meant that since 2010, local authorities have been less focused on service outputs and outcomes than was previously the case (NAO 2014).

The Local Audit and Accountability Act 2014 confirmed that future local authority audits would be overseen centrally by the NAO, focus solely on financial management, and have no performance assessment. This, together with the prevailing austerity, made "financial conformance" rather than "operational performance," the overriding focus, for both central and local government and ostensibly weakened local accountability, because it obscured the potential impact of austerity cuts (Ferry and Eckersley 2015).

The NAO have recently demonstrated how "changes in public service provision have increased the risk of provider failure" (NAO 2015, p. 9), and the accountability deficit for performance at an "individual" local authority level is only partially addressed through the NAO (2014) value for money report on "financial sustainability." The "lack" or inadequacy of performance information currently available also makes assessing the value for money aspects of financial sustainability a "challenge." Essentially, the NAO suggest that the new accountability and audit arrangements lets us know if the DCLG and local authorities are spending within budget, but

not what value the public are getting for their money.

To make up for the diminution in accountability arrangements, the transparency agenda led to ministerial claims that an army of "armchair auditors" would fill the accountability void created by the closure of the Audit Commission and the abandonment of performance audit (DCLG 2010), but this has demonstrably failed to materialize with the result that local authorities are not comprehensively or robustly assessed on the quality of service outputs and outcomes (Ferry et al. 2015). This, combined with austerity, has reinforced the principle that holding down input costs through an overriding focus on budgetary stewardship is the predominant managerial objective within local authorities, which means that there is reduced scope for officers to innovate or try new ideas (Ferry et al. 2017).

In England, over the last 5 years, it is contended that the accountability arrangements have diminished and not been adequately replaced by transparency initiatives. Research from elsewhere, however, suggests that over the longer term some performance information use will be reintroduced as financial stress eases and the focus once again shifts back to value for money and not merely cutback management (Raudla et al. 2013). This is very important and a number of themes can be set out for critical reflection by global policy makers and practitioners alike. This may contribute to a broader debate on accountability and transparency which are particularly important pillars underpinning our democratic system of governance but are also important to jurisdictions with other forms of governance. Five themes from our study will now be set out, to be followed by some generalized conclusions.

## Theme 1: Transparency May Not Adequately Replace Accountability

For English local government, the accountability and transparency arrangements are now part of a more complex organizational landscape wherein it is contended that accountability has been reduced and not adequately replaced by increased transparency.

For example, in terms of accountability, the emphasis is now firmly on financial conformance and Sector Led Improvement (SLI) by local government themselves (House of Commons 2011). Value for money capability has been significantly reduced following abolition of the Audit Commission and decommissioning of corporate performance management arrangements. Future policy makers must decide if they need to strengthen accountability particularly when austerity recedes and the focus on cutback management becomes less paramount and gives way to a revised interest in value for money.

Audit arrangements are now subject to the Local Audit and Accountability Act 2014, which repealed the Audit Commission Act 1998 and reformed the processes for performance and financial audit of local government. These reforms included abolishing the Audit Commission (which closed on 31 March 2015) and transferring a number of its responsibilities to other organizations, including the NAO. In the place of the Audit Commission, there is a new framework for local public audit, due to start after the Commission's current contracts with audit suppliers end in 2016/17 or potentially in 2019/20 if all the contracts are extended. A transitional body Public Sector Audit Appointments Limited (PSAA) will oversee the contracts in the intervening period. The NAO will produce the code of practice and supporting guidelines for local authorities as well as enhance its existing value for money studies by conducting a small number of reports into local public service delivery.

Once the transitional audit arrangements come to an end, local public sector bodies will have the power to appoint their own auditors, although local bodies can collaborate and continue to procure audit at a collective or national level (Timmins and Gash 2014).

In terms of performance management, the coalition government has dismantled much of the performance management framework for local government, replacing centrally driven performance reporting and data requirements in favor of sector self-regulation, transparency, and local accountability.

Following the abolition of national performance frameworks, local authorities and the

LGA introduced a SLI approach to improvement (House of Commons 2011; Timmins and Gash 2014). This is based on four underlying principles: Local authorities are responsible for their own performance, local authorities should be accountable locally not nationally, there is a sense of collective responsibility for the performance of the sector as a whole, and the role of the LGA is to provide tools and support (LGA 2015).

## Theme 2: Loss of Formal Information and Interrogation Capacity Has Not Been Replaced by Informal Arrangements

Information and its interrogation have both suffered a significant loss of capacity partially due to the abolition of the Audit Commission and the dismantling of performance management arrangements. This creates significant challenges in being able to ascertain what programs to undertake and determine which are providing value for money. The diminishing evidence base leaves things more open to opinion and politics. Citizens may therefore judge on a diverse range of things, and there is less independent evidence to refute or support such judgments.

DCLG's local authority statistics and CIPFA's financial and performance databases allow for investigation and analysis of expenditure and performance information although the latter is only available to subscribers. However, the collection, analysis, availability, transparency, and interrogation of these data and other local authority statistics have become increasingly difficult since 2010.

Although ministers argued initially that volunteer "armchair auditors" would step into the gap created by the Audit Commission's abolition and analyze the data published under transparency requirements, this has not proved to be the case. Even if this army of volunteer researchers had emerged, they would be unable to draw meaningful conclusions and recommendations from the raw data that has become available (House of Commons Public Accounts Committee 2015).

## Theme 3: Austerity and Cutback Management Will Challenge Governance Relationships

During the recent sustained period of austerity in England, the theory and practice of cutback management has been adopted. These new arrangements coupled with localism for English local government (Lowndes and Pratchett 2012) have provided a significant challenge for practitioners in the governance of their local authorities, leadership of services, and strategic alignment of plans and delivery especially for those involving multiple partners.

Practitioners must therefore understand these pressures and manage the risks associated with cutback management but also make provision for governance, leadership, and strategic alignment for the future when austerity recedes and value for money becomes more paramount. Good governance enables a local authority's leadership to pursue its vision effectively and also underpins that vision with control and the management of risk. To assist good governance, CIPFA and the Society of Local Authority Chief Executives (SOLACE) issued Delivering Good Governance in Local Government: Framework and Accompanying Guidance Note in 2007, which was updated in 2012 through an addendum and revisions.

To facilitate strategic alignment, DCLG awarded the CIPFA/SOLACE Framework "proper practices" status through nonstatutory guidance. As a result, local authorities must prepare and publish an annual governance statement to accompany the statement of accounts in order to meet a statutory requirement set out in Regulation 4(2) of the Accounts and Audit Regulations 2003, as amended by the Accounts and Audit (Amendment) (England) Regulations 2006. This regulation requires local authorities to prepare a statement of internal control in accordance with the Framework's "proper practices" for developing and maintaining a local code of governance and for discharging accountability for the proper conduct of public business. These statements follow a standardized template set out in the framework, in which local authorities make their practices and structures open and explicit, and

map them against agreed best practice. This helps to ensure that governance practices are strategically aligned.

However, strategic alignment is under pressure, because local government has been undergoing significant change in an increasingly complex environment. In addition to economic and financial sustainability challenges, the Localism Act and other legislation has brought new roles, opportunities, and greater flexibility. Furthermore, local authorities have been changing their models of service delivery for some time; local public services are now delivered directly, through partnerships, collaboration, and commissioning, and by combined authorities. The introduction of new structures and ways of working provide challenges for strategic alignment in managing risk, ensuring transparency, and demonstrating accountability.

## Theme 4: A Reduction in Performance Information Is Constraining Public Reporting, Scrutiny, and Public Assurance

The changes to performance management information in particular has meant that reporting is more partial, scrutiny has become more variable, structures have changed, and quality assurance is receding with the demise of professionalized performance audit. Public assurance of value for money is therefore more difficult to establish.

Local authority financial reporting to central government now focuses solely on financial information. The reports are based on the statutory requirement for local authorities to ensure accountability and transparency for financial stewardship, which is set out in the Local Government Act 1972. A single individual, the Section 151 Officer (who is often the finance director and must be a qualified accountant), is personally responsible for producing a balanced revenue budget every year. The Local Government Act 2003 makes a balanced budget a requirement and the Section 151 officer has to report on the robustness of estimates and adequacy of reserves. These budgets and reports are then subject to a financial audit. Since 2010, there has been no statutory requirement for local authorities to produce performance reports for central government.

Internal "overview and scrutiny" committees were established by the Local Government Act 2000. They were intended as a counterbalance to the new executive structures created by that Act, which required all large local authorities to introduce either elected mayors or a leader and cabinet system. The role of these committees was to develop and review policy and make recommendations to the council. Following the Localism Act 2011, councils with executive governance arrangements are only required to have one overview and scrutiny committee that is independent of the executive.

Many local authorities have separate staff and financial resources for overview and scrutiny committees, although annual surveys conducted by the Centre for Public Scrutiny indicate constantly diminishing resources over the last 8 years (Centre for Public Scrutiny 2015). The Centre has recently called on local authorities to "up their game" in respect of scrutiny following the scandals associated with children's services in Rotherham, and a report by Grant Thornton highlighted concerns from officers and councilors that they no longer provide sufficient interrogation.

## Theme 5: Changing the Mix of Accountability and Transparency Arrangements May Involve Value for Money Risks

The challenges of austerity localism for the financial sustainability and resilience of local government coupled with significant changes to accountability and transparency arrangements raise real and potential value for money risks.

The statutory requirements of the Local Audit and Accountability Act 2014 concentrate on annual financial reporting. This may hinder broader short-, medium-, and long-term sustainable management of financial and other resources.

These risks are not mitigated by other parts of the performance management and/or public assurance regimes, which could be perceived as a weakness of the current regime over previous performance and financial assurance arrangements.

The problem is compounded by the abolition of centralized performance monitoring frameworks, comparable quality assured indicators, and the Audit Commission itself and ultimately means that there is insufficient data available on the quality and scope of local government services as well as very limited capacity to interrogate this data effectively.

## Conclusions

Public accountability may be a cornerstone of democracy but in advanced western liberal democracies, transparency is perceived to be relatively less expensive because of the capacity and capability of the internet to disseminate large quantities of data that citizens readily have access to. It is therefore an attractive option in times of austerity and financial cutbacks for policy makers and practitioners to reduce professionalized accountability as a means to save money and to promote transparency as a surrogate.

However, an important issue for policy makers, regulators, and practitioners is that transparency is not a straightforward panacea for a reduction in accountability arrangements. Financial cutbacks alone should not be an acceptable reason to undermine and significantly reduce public accountability.

It is easy to appreciate, if not wholly to neither agree with nor consider suitable, how financial conformance has been allowed to become the main focus of a reduced professionalized accountability apparatus as part of the policy and practice of cutback management under austerity in the UK. The problem is that such arrangements are not adequate for the assessment of value for money or for assessing neither the financial resilience nor the sustainability of public services. This is because these arrangements generate significant challenges for governance, leadership, and strategic alignment in managing risk. Indeed systemic "service" failure becomes a concern as the sole focus becomes the budget. This problem is only exacerbated as reporting is partial, scrutiny variable and quality assurance reducing as the focus becomes the current financial position rather than a comprehensive view of performance. Essentially, any changes in accountability and transparency arrangements inevitably change the risk profile with regards to value for money.

If we are to have economic efficient and effective public services, which the citizen has the right to expect, then arrangements to properly assess operational performance are just as important and must complement those for financial conformance. This should be the case whether public money is being used during austerity or in a period of growth. In a liberal democracy, the assurance of the public that government is providing appropriate stewardship of public money is sacrosanct and so should the achievement of value for money.

# Local Governments and Crisis Management

Romeo B. Lavarias
Division of Emergency Management, City of Miramar Fire-Rescue Department, Miramar, FL, USA

## Synonyms

Contingency planning; Crisis planning; Disaster management; Disaster planning; Emergency management; Emergency preparedness

## Definition

Crisis management refers to the efforts made by organizations to prepare for, respond to, recover from, and mitigate against disasters and crises.

## Introduction

In the *Handbook of Crisis and Emergency Management* (Farazmand 2001), the editor's discussion of the nature of crisis is still relevant today as it was in 2000, in the context of its impact on local government. The editor accurately states that crises, "scramble plans, interrupt continuities, and brutally paralyze normal government operations and human lives" (p. 3). He elaborates that there are "two types of crisis: a process-oriented one developing over a period of time, and the other a sudden rupture developing within weeks, days, hours, or even minutes" (Farazmand 1996). The first description of what constitutes a crisis has been applied generally to a local government experiencing a natural disaster (hurricane, flood, wildfire, landslide, mudslide, earthquake, etc.) through setting up policies and procedures to mitigate and prepare for these eventualities. However, in today's complex society, the second description of crisis is much more reflective of what local governments face today. Crisis in local government does not only include natural

disasters (add tsunamis and nuclear reactor meltdown to the list), but now must include domestic terrorist attacks (homegrown terrorism); bioterrorism; school shooting; active shooter; controversial police shooting; disease outbreaks (Zika virus); cyber attack; ransomware; local governments' own internal issues, i.e., Flint water crisis; and the effects of climate change.

But while the types of crisis events have increased, natural disasters are still the prevalent crisis for local governments. According to the International Federation of Red Cross and Red Crescent Societies, there were a total of 317 natural disasters that affected 94 countries. These disasters impacted 107,000,000 people. Of this total 58,000,000 people in China were affected by floods and drought, 5,884 people were killed by technological disasters, and 8,186 people were killed by other natural disasters. The top five disasters globally from 2005 to 2014 were floods (1,753), earthquakes (1,254), storms (988), heat wave (262), and drought (223). Regardless, local government must be able to handle any crisis confidently and effectively because "...public support is a key pillar of effective government. Negative views of government diminish stakeholder interest in solving government's operational problems and undermine the ability of government ..." (Lavigna 2009).

The field of crisis management is known by other names, such as emergency preparedness, disaster management, emergency management, disaster planning, contingency planning, crisis planning, incident management, organizational resilience, and so forth. However, crisis management coincides with emergency management in terms of establishing a solid structure on how to be resilient after a disaster (Maldonado 2015). The beginning of this field in the United States, and its formal and modern conception for the purposes of this discussion, started from the creation of the Federal Emergency Management Agency (FEMA) in 1979 through President Jimmy Carter's Executive Order 12127. Yet even before FEMA's formal creation, the field of emergency management suffered from lack of interest and an identity crisis. It was most aptly described in Dwight Waldo's (1980) book, *The Enterprise of Public Administration*: *A Summary View*, where he stated,

> When editor-in-chief of the *Public Administration Review*, I tried to identify someone willing to organize a symposium on what I called alternately *disaster management* and *emergency management*. Again, even advertising for a symposium editor failed: not a single candidate. The reasons for our collective indifference I judged to be several, including a perceived lack of professional pay off in this area and vague sense that it is peculiar if not un-American to be looking for trouble. Most fundamentally I think this is involved: Administration is concerned with rationality, order, calculability, efficiency: how can these be applied to the unpredictable, the disorderly, the destructive? (p. 185)

Waldo's (1980) statements are correct portrayals of the way environment crisis and emergency managers operate. Their efforts are attempts at mitigating the unpredictable, disorderly, and destructive elements of a crisis in an environment where order and efficiency are the primary objectives of an organization. Somers and Svara (2009) go on to state that

> ...there is an inherent inconsistency between 'management' and 'emergency.' Management seeks to control and regularize activities. It seeks to reduce variation across a wide range of occurrences and to achieve optimal conditions. In contrast to normal management problems, emergencies are rare and unique. Some aspects of "emergencies" can be "managed" in a traditional sense, but anticipating emergencies takes managers into the realm of uncertainty, and responding to emergencies requires creativity and flexibility in dealing with circumstances that cannot be fully anticipated. (p. 181)

Waldo's (1980) position about public administration and emergency management is further refined by Waugh (2007) who states that,

> There is a natural affinity between public administration and emergency management largely because emergency managers plan, organize, manage, human resource, lead, coordinate, review and deal with budgets. Whether they work in the public, nonprofit, or private sector, their organizational responsibilities are critical to their disaster responsibilities. Indeed, most of their time is spent in managing human and financial resources and dealing with other officials and organizations. The discipline of public administration provides a foundation for emergency management educational programs and

> the discipline is increasingly associated with emergency management research. (p. 163)

Waugh (2007, p. 3) reflects on the origin of emergency management as the "quintessential governmental role. It is the role for which communities were formed and governments were constituted in the first place – to provide support and assistance when the resources of individuals and families are overwhelmed." Emergency management today is seen as a complex function that involves almost every facet of everyday life, a multitude of subjects, and coordination among a variety and multitude of local, state, federal, nonprofit, and nongovernmental organizations (NGOs). Crisis and emergency managers need to be able to successfully understand how each facet works individually as well as together toward a common goal. According to McGuire and Silvia (2010), "... public managers find themselves in situations in which the problems facing their organization are increasingly severe, [that] they will [have to] reach out to other entities and agencies" (p. 286). The study by McGuire and Silvia demonstrates that the emergency manager ... is affected greatly by his or her operating environment and that his or her perceptions of the severity of problems and managerial skill explain the level of intergovernmental collaborative activity by that manager" (p. 287).

## National Incident Management System (NIMS)

Taking into account the challenges mentioned earlier that today's crisis and emergency managers contend with, a system that addresses the prevention, response, recovery, and mitigation of a crisis had to be developed. It had to be a system that would enable local government personnel to work together to address a common crisis as well as provide an image to residents that their local government was in control. According to Walters (2010), the general public expects the federal government will "ride in" to save the day when, in reality, an effective emergency management structure's foundation is a combination of a well-developed local response capacity with some help from the state (p. 35). In addition, no two disasters are ever the same, because each disaster has its unique quirks that may require different intergovernmental responsibilities and relationships (Walters 2010). So a crisis or emergency manager may find him- or herself having to coordinate with several levels of government (federal, state, and local), nongovernmental organizations, adjacent jurisdictions, the media, and all city departments. In short, according to Waugh (2007), in the event of a crisis or disaster there will be "a large cast of actors, with a broad range of capabilities and variety of intentions. As a result of this reality, to be able to coordinate an intergovernmental, multi-organizational, public-nonprofit-private sector network can and will be a monumental task. It will be a task that requires considerable technical, administrative, political, social and interpersonal skill." Complicating the task is the constant changeover of personnel in all these organizations. This aspect is identified in a white paper prepared by the National Homeland Security Consortium in October 2010, where "the impending change of federal, state, and territorial leaders in key positions can create instability" (p. 6). This is why NIMS was created.

According to FEMA (2016) and its policy that all incidents (crises) begin and end locally, NIMS provides "a comprehensive, national approach to incident management that is applicable at all jurisdictional levels and across functional disciplines. One of the key intents of NIMS is to improve coordination and cooperation between public and private entities in a variety of incident management activities and provide a common standard for overall incident management." NIMS enables government at all levels (federal, state, tribal, and local), the private sector, and nongovernmental organizations (NGOs) to work together on incidents regardless of the incident's cause, size, location, or complexity (FEMA 2016). In essence, whether it is a single agency fire response to a multiagency, multi-jurisdictional natural disaster, or terrorism response, NIMS creates a common language and common hierarchy where regardless of an organization's purpose staff can all operate seamlessly and without the confusion of

individual departmental jargon or specific internal operations that are unfamiliar to other departments.

According to Kiltz (2011, p. 9), "In order to prepare professionals to serve within the homeland security enterprise, it will be necessary to provide them with the knowledge and skills to perceive, analyze and respond to disasters and crisis from multiple perspectives and paradigms." However, even with NIMS in place, local governments face the issue of a lack of NIMS trained personnel. When NIMS experienced trained staff leave, they are replaced by new staff that are not trained in NIMS or may not have even been through a disaster. Complicating the lack of trained staff further is new disaster technology, new standards of procedures, and communications with city staff and residents. New disaster technology (WebEOC, weather apps, disaster apps, etc.) provides a streamline and efficient way to monitor a crisis anytime; however the system is often only used during a crisis. It leads to staff being unable to remember their training (if they had any) to properly use the system, which results in the need for on the spot refresher training under the pressure of an upcoming crisis. New technologies are constantly being introduced and standards of procedures are constantly being revised and updated. But how they may impact a crisis is often not considered in their development or deployment to those staff that will need to utilize it before, during, and after a crisis. It results in conflicting rules that may hinder the local government staff in carrying out its duties during a crisis. Finally, with the increasing dependency and utility of social media, there is a constant need for information from staff and residents on what to do, where to go for resources, and how to reduce the impact of a crisis. It requires constant and almost instantaneous information pushed out quickly and accurately, which can be complicated. Staff is often working under short time frames, with incomplete information due to lack of feedback from the environment, power shortages, and lack of adequate resources. A proposed remedy to the situation is constant year round training and exercises coupled with the simple use of checklists.

## Training and Exercise

Local governments' ability to plan, respond to, and recover from a broad range of crises and disasters in the future will be determined in large part by the quality and commitment of the local, state, and national emergency management systems. To improve this quality and demonstrate the priority, crisis and emergency managers must lead the effort for government staff to not only be trained but to exercise the skills they have learned through the training. But these efforts take time and resources that many governments feel that they cannot afford due to shrinking budgets. What must happen is a change in the organizational culture where the benefits of crisis and emergency management are seen as an investment that provides a return in the form of speed of recovery (back to normalcy) and confidence instilled in the general public that their government is handling the situation. One additional improvement added to many governments' crisis management arsenal is the use of simple checklists and emergency management software.

The value and simplicity of checklists was covered in Atul Gawande's (2010) book, *The Checklist Manifesto*: *How To Get Things Right*. In his book, he emphasized that checklists help experts manage a complex process. They make priorities clearer and prompt people to function better as a team. They essentially help people be as smart as possible every step of the way, ensuring that everyone has all the critical information, that everyone is systematic about decision-making, and that everyone that needs to be spoken to be included. All are key factors in crisis and emergency management. With the utilization of checklists in the NIMS process, personnel are now more able to perform their assigned duties and responsibilities and understand where they fit in. In many cases, the checklists are modified to suit the different phases of a crisis and/or disaster for every position in the NIMS organizational structure.

In addition to the checklists, governments have utilized technology to help advance their crisis management efforts. Emergency management software helps in monitoring the

development and recovery efforts of a crisis. It allows all participants to know what is happening at every phase of the crisis or disaster and in every section of the NIMS. But most importantly it helps record all resources (staff hours, equipment, resources, repairs, etc.) used in the course of dealing with crisis and receiving federal reimbursement from FEMA. Through FEMA reimbursement, governments are better able to aid the public in recovery, assist businesses to apply for short-term loans, and help governments to make mitigation efforts that lessen the impact of a crisis in the future. From an economic perspective, this process is critical in being able to replenish the funds in their budget that were expended such as employee salaries, cost of equipment, and resources used before, during, and after the crisis.

## Conclusion

In terms of natural disasters, the World Bank has stated that through a combination of climate change, population growth and urbanization over 170 million people every year – up from 60 million just three decades ago – are impacted by natural disasters. The total cost of destructive storms, floods, and droughts has jumped from $14 billion to $40 billion annually. They predict that the number of people affected and the destructive cost will continually rise as more people move to urban areas and the coast. In terms of man-made disasters, the growth in urban areas has also directly led to an increases in urban (versus nonurban) terrorism (Savitch 2008). In the last four decades since 2008, cities have been subject to more than 12,000 incidents of terrorism and incurred 73,000 casualties. Approximately three out of every four attacks and four out of five casualties occur in a city (Savitch 2008). Based on these realities, crisis management must continually adapt to these future risks, threats, and vulnerabilities. It can accomplish this by coupling with emergency management, whose primary purpose is to mount efforts to help the community at large through preparedness, response, recovery, and mitigation.

How government operates before, during, and after a disaster can either instill or destroy the public's confidence in it, which could last for years after the community recovers. Training at all levels of government is essential. In today's instantaneous society, the public has come to being provided with just-in-time deliveries at their doorsteps. In the event of a disaster, there will be an interruption of these deliveries that could compound the crisis or disaster and create a breakdown in society. The degradation may be avoided by having trained government emergency personnel prepared to react at every stage of a crisis or disaster. It is accepted that government cannot rise to the occasion if they do not have adequate training to fall back on. A well-trained government staff provides reassurance to the public and elected officials that the government is in charge and making every effort to bring the public's life back to normal.

# Local Governments and the Property Tax in the USA

Julius A. Nukpezah
Department of Political Science and Public Administration, Mississippi State University, Starkville, MS, USA

## Synonyms

Local authority; Wealth tax

## Definitions

| | |
|---|---|
| Property tax | is a wealth tax utilized by local governments as a primary revenue source and is applied to (1) real property, which entails land and its improvements, and (2) personal property, which is the tangible and intangible aspects of a taxpayer's personal wealth. |
| Local governments | are political units of a state and include counties, municipalities, school districts, and special districts. |

## Introduction

Property tax is a primary source of revenue for local governments in the 50 American states. While dependence on this source of revenue has declined for state and federal governments over the years, local governments continue to look to property tax as a revenue source for the provision of public goods and services to their residents. For the fiscal year 2015, property tax contributed the most to state and local government revenues (31.1%) with general sales (23.5%), individual income (23.5%), corporate income (3.7%), and other (18.2%) taxes lagging behind (Tax Foundation 2018). This makes property tax an important subject for both scholarly and professional interests. Local tax efforts, especially from property, determine the quality of services local governments can provide, including the quality of school districts, which contributes to local prosperity, progress, and autonomy.

This chapter provides a discussion on property tax in the context of local governments within the US federal arrangement. The chapter discusses local property tax in the federal context. Also, the history of the property tax and the property tax revolt that provide a background to property tax in the USA are examined. Furthermore, the uses and benefits of property tax to local governments, property tax base and rate, and property tax exemption as an economic development tool are reviewed. Finally, the conclusion expresses the hope that local property tax will continue to be a reliable revenue source for local governments.

## Local Governments in the Federal Context

The tenth amendment to the US Constitution establishes the federal arrangement; the rights of states and federal governments as sovereigns. The amendment asserts that the federal government possesses only those powers that are delegated to it by the US Constitution and that the states exercise all remaining powers. Thus, because the US Constitution is silent on local governments, they are creatures of the states that allow them

to exist and derive their authority from respective state Constitutions and statutes. While the relationship between local governments and their respective states is vertical, the relationship between one local government and another is horizontal. Vertical relationships exist among governments with unequal authority (i.e., a superior-subordinate relationship), while governments in horizontal relationships are considered equals.

While local governments exist at the leisure of their states, some of these governments such as municipalities may receive Home Rule status that enables them to establish Charters for self-governing and to regulate local matters. These governments introduce user charges and fees for government services such as utilities as part of their proprietary activities, tax the wealth of residents through property taxation, have local options for sales tax, and make bylaws that do not conflict with state Constitution and laws. Non-Home Rule states allow their local governments to administer their governments using state statutes or variations thereof that are permitted by the states. The Courts have upheld the supremacy of states in precedential rulings that Home Rule status of municipalities is subservient to state constitutional authority in what has come to be known as Dillon's Rule (doctrine).

Local governments are classified as general purpose governments that provide multiple services and include counties and municipalities (cities, towns, and villages) or single-purpose governments that perform only one function and include special districts and independent school districts. For example, independent school districts are single-purpose governments because they provide only educational services. The 2012 US Census of Governments indicates that there are 90,056 local governments in the USA, which are made up of the following:

- 3,031 counties or county equivalents
- 35,879 municipalities and townships
- 12,880 independent school districts
- 38,266 special districts

*Counties* are administrative units of a state and the mechanism through which states provide services such as public health and social services to their residents. Because counties cover the entire US geographic land area, unincorporated areas that would not be served by incorporated cities receive municipal services from their county governments. The Sheriff office, county road infrastructure, and emergency services that are provided by the county are financed through property tax.

*Municipalities* are general purpose governments that provide wide-ranging public services such as trash collection, utility services, water, and electricity through user charges and fees. However, municipalities also impose a property tax on wealth in their jurisdictions for the production of public goods and services such as public safety, public works, parks, and recreational facilities.

*Special districts* provide only one specific service within their boundary jurisdiction and are established for regional provision of particular government services such as fire, sanitation, sewerage, water, mosquito control, airport, public transportation, and hospital services. Independent school districts, the largest group of special districts, provide educational services to the districts they serve. Where special districts are organized as taxing authorities, they tax properties to finance their activities. Property tax is the primary own-source tax revenue for Kindergarten through high school (K-12 education) education.

## History of the Property Tax

The property tax has a long history in the USA and predates the founding of the nation. However, over the centuries, reliance on property tax for revenue has been changing for federal, state, and local governments. In 1992, property tax contributed 73% of total local government revenue and 45% of state tax revenue attesting to the increasing dependence of the tax by local governments. However, reliance on property tax has declined

for both governments with a decline for states steeper. States now derive less than 2% of their revenue from property tax, while local governments derive more than 40% of their revenue from this revenue source.

The colonial government tax the wealth of residents, primarily land. Understandably, this taxation is unpopular. The revolt consequently led to the revolutionary wars and eventual independence of the USA. In the early history of the USA, the national government derived revenue from tariffs on imports, excise, and direct taxes. The passage of the federal income tax law in 1913 introduced a major source of revenue for the federal government. Individual and social security payroll taxes contributed 46% and 32% of total federal revenue in 2015.

After the independence of the USA, state governments had the responsibility for most of the activities that are now managed by local governments and derive a large portion of their revenues from property tax for infrastructure development and construction of transportation systems including waterways and canals. However, beginning with the twentieth century, states started developing new revenue sources from sales and income taxes and dependence on property tax as a revenue source wanes. Property tax is the most crucial source of revenue for local governments. It is easier for local governments to use this tax source to demonstrate the quality of services they provide to residents and thereby justify its use than state and federal governments. Goods and services produced with benefit taxes are tangible and readily observable as in education services, road infrastructure, and public safety.

However, property tax yield has been dropping since World War II (Aaron 1975). The level of property tax a local government collects is an indicator of its relative importance in the region and quality of local education. The less property tax a local government can collect means more of other taxes or less public expenditure on public goods and services. The use of market approaches to local government has led to the use of benefit-based revenue, such as user charges and fees.

## Local Governments and the Property Tax Revolt

Citizen aversion for property tax could be traced to the colonial era and the American Revolution in the seventeenth century that eventually led to the colonies' independence from Great Britain (Mullins and Wallin 2004). Citizen unhappiness with property tax during the Great Depression years of the 1930s caused worker agitation against the payment of property taxes due to high unemployment rates and loss of economic opportunities (Yuan et al. 2007). While the above revolts were national in character, local government crises in the late 1970s and the early 1980s produced variations across the states regarding tax and expenditure limitations. Notable tax revolts by citizens occurred in California, Massachusetts, Colorado, and Oregon and have occupied significant places in American tax scholarship and history:

- California's People's Initiative to Limit Property Taxation, also called Proposition 13, was passed after citizen agitation when the state Supreme Court declared unconstitutional the system of financing education through local property tax. The law limited tax rates on the full assessed value of properties to no more than 1%. It prohibits assessments of existing property values except to changes in ownership and new construction, which ensures that senior citizens do not lose their homes due to higher valuation and taxation. It decreased property tax to 1976 assessment value and restricted annual increases in assessed value to inflation but not exceeding 2% per annum. It also requires a two-thirds majority by voters to amend the law.
- Massachusetts's Proposition 2½ passed in 1980 following anti-tax interest group campaigns. It provides that property tax revenue by local governments in the state should not exceed 2.5% of the assessed value of the taxable property of the jurisdiction. The law also places limits on annual increases in property tax to no more than 2.5%. The excise tax rate on automobile in the state was limited to 2.5%. However, the law provides that citizens

of a local government may vote in a referendum to override the provision and consequently approve increases.

- Colorado's Taxpayer Bills of Rights (TABOR) passed in 1992, championed by pro-free-market interest groups advocating for limits on growth of government. The law seeks to limit tax growth to inflation and population increases. It asserts that voter referenda must approve larger increases. The government is to refund excess revenues to taxpayers. The refund provision, however, was differed by sunset provision in 2005 and renewed in 2011. However, before the repeal, Colorado governments refunded more than $2 billion to taxpayers. Since the suspension of the refund provision, more than $17 billion has been made available for other public programs by the state.
- Oregon's Property Tax Reduction and Limitation Amendment (Ballot Measure 47) passed in 1996. It reduced property tax rates, thereby reducing taxes by at least 10% of the 1994/1995 figures. It limited future increases in assessed values and tax rate to no more than 3% and limited local revenue accumulation. Furthermore, the Measure required double majority rules for local tax measures to pass. Double majority rule means that the majority of citizens must participate in the referendum and that majority of those voting must support the measure for it to take effect. The double majority rule was amended to a single majority by measure 50 in 1997 voter referendum.

In all, 46 states have introduced some form of constitutional or statutory limitations for states and local governments. Tax and expenditure limits (TELs) usually involve placing restrictions on tax rates, assessed values, revenue, and expenditure of local governments (Yuan et al. 2007). If local governments' ability to raise revenue is hindered, it obstructs local political autonomy and leads to increased dependence on state and national governments leading to centralization in the financing of local public services. Empirical studies also find that state-level tax and expenditure limits hurt the economic performance of the states (Bae et al. 2012).

Other effects of tax and expenditure limits include limits on local government employment abilities due to constraints on revenues and expenditures. Contrary to expectation, the Bae et al. study finds that reduced tax burden does not necessarily stimulate economic growth. However, local governments experiencing fiscal constraints through tax and expenditure limits would likely consider diversifying their revenue sources and levy user charges and fees on residents. User charges and fees utilize benefit-received principles where consumers pay market value for their consumption and, therefore, eliminate wastage and constraint on taxpayers' money (Yuan et al. 2007).

TELs are classified into seven categories as follows (Mullins and Wallin 2004):

- *Overall property tax limits*. This is the most common and places ceiling on property tax rates that may not be exceeded.
- *Specific property tax limits*. This applies to specific jurisdictions.
- *Property tax levy limits*. This policy constrains the total amount of levy that may be collected.
- *General revenue limits*. This laces a cap on revenue that may be collected.
- *General expenditure limits*. This constrains spending to a fiscal year.
- *Property assessment limits*. This controls the ability of local governments to raise revenue by a reassessment of property or administrative escalation of property values.
- *Full disclosure limits*. This requires truth in taxation – public discussion usually at town hall meetings and specific legislative decisions through voting.

## Uses and Benefits of Property Tax to Local Governments

While federal and state governments derive most of their revenues from income and consumption (sales) taxes, respectively, local governments tax wealth (properties) within their jurisdictions, which contributes to most of local revenue sources. It is also known that northeastern states

tend to depend more on property tax for financing local programs than do southern and western states. Because local governments utilize property tax revenues to improve the quality of public goods, higher property tax is associated with higher budgetary spending, which translates into higher public services as well as a higher quality of school districts (Oates 1969). Benefits of the property tax as a revenue source include the following:

- Benefits from property tax payments are tangible and observable in the quality of goods and services the local government provides. For example, controlling for all factors, local governments that report higher revenue efforts also benefit from better public services. Furthermore, the better services that communities provide with taxpayer money contribute to safer neighborhoods, more livable communities, and higher quality of school districts.
- The property tax is a stable source of revenue for local governments compared with revenue from sales and income, which are less predictable. Property values do not fluctuate drastically once determined, which contributes to effective revenue forecasting and budgeting of local expenditures.
- Nonresidents who own property in the tax jurisdiction are reached by property tax and contribute to local revenue, which makes the tax difficult to evade. Mobile households move to neighboring cities that do not have sales tax to evade it. Similarly, income taxes are self-reported and could be underreported by taxpayers. However, properties are not mobile; valuation and assessment of properties are done by designated government offices and are difficult to avoid.
- When used judiciously, property tax increases the quality of public services and hence property values. This is because there is high demand for safer communities and quality school districts. Moreover, communities with higher valued properties tend to have lower taxes because lower rates likely generate the revenue needed for the production of goods and services.

There are challenges with property tax administration that contribute to their lack of popularity. These include:

- The tax liability is paid in one lump sum during the tax season, which makes them unpopular relative to consumption and income taxes that are paid in small increments over the course of the year.
- Local governments with several exempted properties tend to shift the cost of providing public goods to owners of properties that are not exempt. For example, federal, state, and local buildings are exempt from property taxes. Also exempt are properties owned by charities and religious organizations, although the cost of protecting these properties are borne by local taxes.
- Methods of assessing property values vary across one jurisdiction to the other, which often pose a misunderstanding between property owners and evaluators.
- Areas with more vertical layering of local governments may result in households paying more in property taxes than those with fewer local governments in vertical layering because of a shared common tax base.

## Property Tax Base, Tax Rates, and Exemptions

Tax base refers to what is included in the assessment of a taxpayer's liability. That is, what the government considered taxable. The percentage that is applied to the tax base (what is taxable) to determine taxpayer liability is the tax rate. Property taxation abounds in anomalies with regard to the base and the rate that is applied to property owners. Consequently, the property tax may be regressive, where there is the tendency of the proportion of taxpayer's income paid out in property tax to decline as incomes rises (Aaron 1975).

In most taxing jurisdictions in the USA, the law requires that all properties be taxed at the same effective rate. However, unequal administration of tax abounds. Unequal administration

of rates may be intentional or unintentional. Intentional unequal administration arises when tax administration purposely reduces the assessment of certain taxpayers. Unintentional variation, on the other hand, results from active discrimination because of the determination of the market value of a real property. This is because reformers propose special exemptions and rebates, which alter the tax base.

Tax base includes real property such as land and improvements thereof, namely, buildings, infrastructure developments, and improvements. The base may also be personal property such as tangible (e.g., equipment, vehicles, and jewelry) and intangible assets (stock, bank deposits, and insurance policies). Many overlapping governments, however, have different rates and different exemptions. The property tax rate is not always determined by objective criteria. Whereas one jurisdiction may exempt some facilities such as cemeteries, medical facilities, farmlands, nonprofit organizations, and public buildings from the base and hence exempted from paying taxes, others do not. Henry George championed the idea that one way of encouraging infilling or development of communities is by using a two-tier property tax policy and proposed that land should be taxed at a higher rate than improvements. This policy forces developers to put land into use quickly.

Furthermore, methods of taxing business properties vary widely from one jurisdiction to the other and that the market value of property used by railroads, utility, banks, and mines is difficult to ascertain, which explains the differences. Besides, the coverage of personal tangible and intangible property varies. Some jurisdictions tax personal items such as cars (e.g., Missouri, Arkansas, and Montana); however, others choose not to. Different jurisdictions claim the authority to tax intangibles such as stocks, bonds, and cash, among others at varying rates. Consequently, tax rates vary widely across the states and local governments. Hawaii (0.29%) has the lowest effective tax rate for its governments, whereas New Jersey (2.16%) has the highest (Tax Foundation 2018). In 2015, the per capita property tax collected for all governments in the USA was $1,518; this, however, varies widely from a high of $3,074 in New Jersey to $540 in Alaska (Tax Foundation 2018).

*Homestead* exemptions provide for the reduction of assessed values of a property by some fixed amounts. Relatively inexpensive housing is usually exempt from taxation. There may be a lower effective average tax rate for owner-occupant properties, while senior citizens may receive homestead exemptions on their properties.

*Circuit breaker* programs provide payment to taxpayers usually as an income tax refund equal to the excess of residential property tax waiver, usually over a specified fraction of income. Circuit breakers aim at reducing the supposed regressivity of the property tax and protect low-income taxpayers, which enable aged taxpayers to remain in homes that they might otherwise have to vacate.

## Property Tax Exemption as an Economic Development Tool

Local tax policy and tax revenues are tools for economic development. Local community economic development is a rationale for changing the economic situation within the community (Shaffer et al. 2006) and embodies (1) economic development, which focuses on jobs, income, and business growth, and (2) community development, which focuses on equal rights and institutional organizations. Community economic development promotes growth and structural change and enhances community relationships (Boothroyd and Davis 1993). Community economic development seeks to address problems with negative consequences including urban decay, sprawl, concentrated poverty, and environmental degradation. When community economic development is defined in the context of wealth creation, it entails more jobs, tax revenues, and a combination of these while ensuring a sustainable source of revenue for local governments.

Strategies for economic development include (1) business attraction, which uses incentives to get business in; (2) business retention, which aims at keeping the industries in the local community;

and (3) improving quality of life and sustainability, which is about environmental protection, economic growth, and social progress (equity).

To attract large-scale businesses that are capable of transforming local economies to relocate to specific local areas, local governments offer property tax incentives to induce these businesses. Annually, local governments forgo billions of dollars in expected revenues from machinery and equipment tax, in earmarking tax-exempt enterprise zone, and creating tax increment financing (TIF) districts for local economic development. Once these businesses relocate, they must be incentivized to remain in the communities since other localities would likely make offers to attract them. Local governments may wish to induce certain firms to locate or remain within their jurisdictions because these firms contribute more to tax revenue through the public services they consume. Businesses also provide jobs and increase local income and property value.

*Tax increment financings* (TIFs) are tools for local economic development designed for blighted communities by which a municipality places an artificial tax boundary or district around a parcel of a property slated for development or redevelopment. The year in which the district is established is the base year, and the property value at that time is the base assessed value. Increased value of property resulting from the improvements becomes the incremental assessed value. The additional revenue generated is the incremental revenue, which is used to pay back any financing or cost associated with those improvements. The additional revenue or incremental revenue continues to accrue to the development authority until improvements are paid for. The incremental revenue for the property tax is used solely on the TIF district.

Criticisms against TIF as an economic development tool are that it is a zero-sum game – it develops a TIF district at the expense of another area of the same region (Man and Rosentraub 1998; Dye and Merriman 2000). However, overall, TIF is perceived as contributing to local economic development. TIF is politically attractive because of the claim that it is self-serving and that it finances development projects from increased tax revenue that the project generates rather than from new taxes or tax increases. TIF enhances the interjurisdictional competitive advantage of cities and is associated with reorientation of local development policies from rehabilitation to revitalization (Anderson 1990; Man and Rosentraub 1998; Skidmore and Kashian 2010; Byrne 2010).

## Conclusion

This chapter has discussed property tax in the context of the American federalism. Given the reliance on property tax, it does appear that the tax will continue to dominate local government administration in the foreseeable future. This is because the tax revenue determines to a large extent the quality of school districts and hence educational services that local governments provide. Furthermore, absent alternative sources of revenue such as local options for sales tax, property tax is the primary own source of revenue for supporting county services such as road infrastructure, rural transportation, street lighting, and firefighting, among others. The property tax, therefore, has a future of continuity in the US local government administration.

# Local Governments Debt

Pedro J. Camões
Research Centre in Political Science (CICP), University of Minho, Braga, Portugal

## Synonyms

Borrower – debtor; Debt instruments; Golden rule; Gross debt; Lender – creditor; Net debt; Total gross debt – total debt or total debt liabilities

## Definition

- **Debt** is a liability in which a creditor has a claim on the debtor.
- **Debt instrument** is a financial claim that requires payment(s) of interest and/or principal by the debtor to the creditor at a date, or dates, in the future.
- **Total gross debt** ("total debt" or "total debt liabilities") consists of all liabilities that are debt instruments.
- **Net debt** is calculated as gross debt minus financial assets corresponding to debt instruments.
- **Domestic debts** are debt liabilities owed by residents to residents of same economy.
- **External debts** are debt liabilities owed by residents to nonresidents.
- **Interest** is the cost (expense) that the debtor incurs for the use of the **principal** outstanding.
- **"Golden rule"** of balanced budget prescribes that local authorities should never take on debt to cover current expenditure; it allows, or even promotes, prudent borrowing for capital projects.
- **Capital budget** includes capital receipts (such as revenues from municipal property, various grants received for capital purposes, and borrowed funds) which are spent on local investments or projects.
- **Current budget** includes current revenues used basically to cover operating expenditures.

## Introduction

In the public sector, debt results when public organizations borrow money from an individual or another organization with the promise of repayment at a later date (Mikesell 2013). Subnational governments borrow and accumulate debt in order to finance a part of their assigned functions. In a decentralized setting, these functions are related with the provision of local public goods and services left to be accomplished when markets fail. Within some limits, the theory recommends that, in certain cases such as public investment, it is preferable to finance investment projects from borrowing rather than from current local revenues, because these are paid by tax and the benefits are future (Musgrave 1959). To a small or large extent, local government debt is the rule, not the exception, around the world, as depicted in Fig. 1 that presents data of the OECD countries. In general, local government debt accounts for no more than 15% of GDP, with the exception of Japan with more than 35%.

**Local Governments Debt, Fig. 1** Local government debt as percentage of GDP, 2014. Note: federal countries excluded: Australia, Austria, Belgium, Switzerland, Germany, USA, Spain, Canada. (Source: OECD, *Regions at Glance 2016*, Fig. 3.15)

There is a limit to debt accumulation, however, known as the "golden rule" of the balanced budget (Musgrave 1959), which prescribes that local authorities should never take on debt to cover the current expenditure, but it allows – and according to the some more interventionist views, even recommends – sustainable borrowing for capital investment. This is the rationale behind the frequent prohibition of long-term borrowing for operating expenditure. For example, in West European countries, this is the case in Austria, Denmark, France, Germany, Italy, Norway, Spain, Switzerland, and the United Kingdom. Usually it is permissible to borrow funds for short term (not longer than one budget year), but for cash liquidity purposes only. Notwithstanding, it is important to underline that these general rules are not always very strictly followed.

Along with these benefit of creating capitals, there are also potential hazards in borrowing, both at a microeconomic and at a macroeconomic level. The microeconomic danger lies in the potential for excessive indebtedness of some local governments of a given public sector, which may lead to serious difficulties in the repayment of loans and may even end up jeopardizing the provision of vital public services (local government sustainability). At the macroeconomic level, local governments may contribute to the overall level of public debt (public sector sustainability). At this level, local government indebtedness may have a negative effect with respect to inflation and other important aggregates of the entire national economy.

This entry intends to present a brief description and implications of the main concepts related with local government debt, as presented in the next section. The section explains the functions of borrowing and the main principles regarding its management at the local level. Considering that local government borrowing is generally limited by formal rules of different types, the third section briefly reviews their nature and functions. The fourth section presents some comparative data. The conclusion ends with some recommendations.

## Debt and Associate Concepts

A **liability** is a **debt instrument** since is the requirement to make payments in the future, which can be made in any form, for example, cash and deposits. The **lender** forgoes purchasing power for the promise of repayment later, while the **borrower** receives purchasing power now and makes repayments later. Through the operation, the **creditor** (lender) establishes a principal liability for the **debtor** (borrower), which may change in value over time until extinguished. **Interest** is the cost of borrowing, i.e., the expense that the

debtor incurs for the use of the **principal** outstanding. In formal terms, a debt contract specifies the details of the operation, typically with respect to interest, repayments, time, etc.

The debt amount – **gross debt** – is the total that includes resources originally advanced plus interest accrued to date minus any repayments, meaning that the definition of gross debt does not differentiate between principal and interest accrued.

The timing of future payments of principal and/or interest is not necessarily known. In many instances, the schedule of payments is known, such as on debt securities and loans. In other instance the exact schedule of payments may not be known. For example, the timing of payment might be at the demand of the creditor, such as for noninterest-bearing demand deposits; or when the debtor is in arrears, and it is not known whether or when the arrears will actually be paid. Periodic debt service payments can be classified as interest payments or principal payments, from a cash accounting perspective, but, for most purposes, interest is an accrual concept.

Since borrowing results in additional costs related in the form of interests, using and managing (local) government debt is a challenge to administrators under any circumstances (Shah 2008). This is even more so as decentralization of responsibility, fiscal stress, and pressure to privatize public services increase worldwide (Dafflon 2002). For risk management, debt liabilities and assets may be dealt with in an integrated manner, focusing on net debt (liabilities deducted by assets). For example, debt may have been incurred to fund assets that will generate income to meet liabilities.

## Functions of Borrowing and Its Management

There are three main reasons explaining why local governments borrow (Fisher 2015). First and above all, borrowing is incurred to finance the realization of public capital projects or investments (schools, roads, water and sewer systems, etc.) defined in the assigned competences of local government jurisdictions. The second reason is to cover budgetary deficits whenever annual expenditures are greater than annual revenues (Mikesell 2013). The third is to provide cash flow for short-term spending. This is a particular type of debt since it is repaid in the same economic period, means that it does not add up to the amount of debt.

In some instances, local governments refinance their debt, when they borrow new funds merely to pay off old debt. This must be option when interest rates of the new debt are lower than the previous one and it is a mere substitution of one debt by another at lower cost.

### The "Golden Rule" and the Current Capital Divide

The basic idea with regard to debt management was stated decades ago by Musgrave (1959), who recommended to follow the "golden rule" that long-term borrowing is allowed for capital projects but prohibited for current purposes. This approach implies and requires a clear distinction between the current and capital budgets of local governments.

A capital budget includes capital receipts (such as revenues from municipal property, various grants received for capital purposes, and borrowed funds) which are spent on local investments or projects, while the current budget includes current revenues used basically to cover operating expenditures (Dafflon 2002). The surplus in the current budget can also be used to support capital needs – typically to repay loans contracted for investment projects. This system increases the transparency of local financial management (Shah 2008). It makes it easier to assess whether current revenues are sufficient to cover operating expenditures, or what the level of operating surplus is. In addition, this information supports the planning and execution of viable capital development programs and helps in assessing creditworthiness.

### No Borrowing to Cover Operating Expenses

There is a common agreement that borrowing to cover current expenditures is either non-acceptable or only accepted in very rare and

specific cases, usually to cover deficits arising from uneven cash flows within a budgetary year and for very short periods of time (Dafflon 2002). The rule of limiting current expenditures to the maximum of current revenues prevents the local government from growing beyond its optimal size, which may be seen as the fiscal burden that voters/taxpayers democratically agree to bear in order to finance the desired provision of public goods. Borrowing creates a short-term fiscal illusion and causes the demand for public services to be artificially high, since it reflects the supply financed partially by credit or bonds, rather than by local tax effort. Moreover, borrowing for operating spending would lead to an excessive debt burden and quickly lead to the rolling over of loans (financing payment of previous debt with new loans) and to very serious indebtedness problems reflecting a structurally imbalanced position (financial unsustainability). In addition, an unbalanced current budget may result in both macro- and microeconomic negative consequences, as the private investments could be crowded out, since local government borrowing draws on a pool of limited financial resources available from local creditors. Local government borrowers are more attractive to banks than private borrowers, because giving credit to public sector entities implies, in most cases, lower risk. Additionally, the competition for borrowing by local governments pressures interest rates, with a negative effect of making private investments more costly.

## Borrowing to Finance Investments Makes Sense

The classic theory of fiscal federalism (Oates 1972) not only allows but recommends the option to finance investment projects with acquired funds (borrowing) instead of own-source or current revenues (Musgrave 1959). In the first place, the rationale is related with "inter-temporal equity," in terms of a balanced burden between costs and the access to benefits. The costs of an investment (expenditures) are typically incurred when the project is implemented (e.g., when a sewage treatment plant is constructed or a city bus is purchased), but the benefits from it are spread out over a longer period. When the capital project is financed with current revenues, those who financed it through their local taxes may not always benefit from it in the future, for example, if they move to another city. At the same time, those who benefit from the project may not have participated in financing it if they moved in to the city after it was completed. But with financing through bank credit or the issuing of bonds, there is an assurance that most users will pay for the benefits either through local taxes or directly through user charges. In a nutshell, borrowing over time is an effective way to overcome the problem of inequitable burden of costs among local tax payers.

Secondly, financing investments through debt is the way to ensure an optimal allocation of resources, in the sense of a tighter relationship between those who benefit and those who pay for them. Though this argument may appear somewhat abstract, virtually any text on management or economics supports it.

Thirdly, there is consensus, both in textbooks and among practitioners, that the benefits derived from an accelerated local development overshadow the costs of borrowing (Mikesell 2013). Very often the benefits of an investment (higher prices or rents, wider scope of interested investors, attraction of new projects, providing additional jobs and tax revenues) are greater than the costs resulting from interest payments to the bank or other creditors.

Fourthly, choosing debt to finance investment projects allows reducing operational costs, when replacing old and costly public equipments leads to reduction in current expenditures, often with an increased quality of services to local citizens. This costs reduction (savings) may in fact be much larger than the costs of borrowing.

In addition, since longer projects tend to cost more, financing from current revenues usually delays the completion of the project for a longer period of time. This leads to higher constant costs and higher total volume of spent resources.

Lastly, there is the advantage in terms of stabilization of required budget resources, since the volume of local government capital spending

fluctuates over the years. If capital projects are financed from current revenues, the demand for resources changes over time as well, which creates instability and uncertainty.

In sum, the best practices of debt management require a clear distinction between the current and capital budgets of local government (Shah 2008). This separation of current and capital budgets is generally followed in Western Europe (though with some exceptions) but less frequent in the case in Central and Eastern Europe and other countries.

## Rules on Debt and Borrowing

Based on the theory of fiscal federalism, laws or statutes very often limit or even prohibit the local levels of government from borrowing (Oates 1972). There are various reasons for this regulation. No regulation would be necessary if one could rely on financial market discipline in the sense that tighter credit market conditions, in the form of higher interest rates, would impose effective sanctions. The creditors would demand higher interest from those municipalities that

**Local Governments Debt, Fig. 2** Fiscal rules ensuring local debt sustainability, 2011. (Source: OECD, Fiscal Decentralization Database, Table 20 (Fiscal Rules Indicator))

**Local Governments Debt, Fig. 3** Local government debt as percentage of total public debt, 2014. Note: federal countries excluded: Australia, Austria, Belgium, Switzerland, Germany, USA, Spain, Canada. (Source: OECD, *Regions at Glance 2016*, Fig. 3.15)

borrow more than they can effectively bear. A similar mechanism would happen if local governments would try to issue bonds: the rating would be low and the market would refuse to buy bonds or would demand a very high interest premium. In this case, legal regulation of local government debt would also be redundant.

However, the theory suggests that the financial market discipline argument does not hold true in reality (Dafflon 2002). On the one hand, lenders do not possess adequate information on the local government financial stance while, on the other hand, local governments do not act to avoid exclusion from the credit market because they do not recognize appropriately market information. In sum, there is a consensus that external regulations and control of local borrowing plays a positive role in ensuring financial sustainability and supporting the development of the local credit market.

Regulation of debt and borrowing in practical terms functions in two modes. Either is based on borrowing controls, including individual borrowing limits and permissions, or is based on control of the level of indebtedness and control of the current budget, which needs to include resources for servicing debt on capital projects. Using one or other mechanism, countries do rely on regulatory systems to ensure local sustainability. Figure 2 shows that "rules are the rule," not the exception, among OECD countries. The OECD database of subcentral government fiscal rules provides a qualitative indicator on the rigidity of rules (with outcomes scaled from 0 to 10), which shows that, although some important variation, no country ignores the need of formal rules to control local government debt.

The same prescriptions also apply when it comes to regulate several levels of government in a supranational setting, with clear implications to subnational governments. As a consequence of the creation, in the European context, of what is called the "Euro zone," the recent regulations of the Maastricht stabilization pact have brought a new element into discussions of local indebtedness. The Maastricht Treaty imposes not only a limit on the overall level of public debt (which should not exceed 60% of GDP) but also on public budgets' deficit (annually limited to 3% of GDP). This transformation reinforces the

**Local Governments Debt, Fig. 4** Local government debt per capita (USD 2005). Note: federal countries excluded: Australia, Austria, Belgium, Switzerland, Germany, USA, Spain, Canada. (Source: OECD, *Regions at Glance 2016*, Fig. 3.15)

point that, at a macroeconomic level, local government financial management should not contribute to exceed the overall level of public debt (public sector sustainability).

This issue raises the question of how much local governments contribute and to what extent they should contribute to "eating up" the overall limit of the national public debt (fiscal common framework). In some countries there have been discussions about whether the debt limit should be distributed among tiers of government. Figure 3 presents information on the contribution of local government to the overall amount of public debt. In the large majority of countries, local government debt accounts for no more than 10% of the total public debt. The most visible exceptions are Norway (over 45%), Estónia (35%), and a group of countries that includes Denmark, Finland, Iceland, Japan, and Sweden (above 25%).

**Local Governments Debt, Fig. 5** Evolution of total and local government debt in some OECD countries, 1995–2014. (Source: OECD, *Fiscal Decentralization Database*, Table 19 (Subnational Debt as percentage of GDP))

From the above, it seems correct to conclude that the relatively small share of local government debt is driven by legal restrictions to local borrowing because, in a majority of countries, local governments can borrow only for the long term to finance investments.

## Local Government Debt Worldwide

Figure 4 shows that the most important source in the composition of local debt in OECD countries. In 19 of the 22 countries shown, loans account for at least 50% of local debt. In Ireland, Greece and Luxembourg, it accounts for more than 80%. The opposite cases are Korea and Hungary with less than 20%.

Figure 5, presenting six illustrative countries, traces how local government debt has evolved in the last two decades. This is especially important in the context of an increasing path of overall public sector debt observed in the same period. If not in the entire period (as is the case of Japan), it is clear a common and strong increase in public debt after 2006, which is certainly linked with the world financial crisis. It is also clear that, in the same period, local governments did not contribute to debt growth. The evolution shows a remarkable stability over the period, in a pattern that is common to many other countries. This fiscal discipline is likely related to the debt limitations imposed to local governments.

## Conclusion

Local governments acquire capital assets to accomplish their assigned functions. In theory and practical terms, incurring in long-term debt is the recommended mechanism to finance capital investments. Given that capital investments are expenditures that benefit future generations, borrowing ensures (i) a balanced burden of cost and access to benefits – "inter-temporal equity"; and (ii) an optimal allocation of resources, in the sense of a closer relationship between those who benefit and those who pay for them.

However, financial market discipline does not ensure local financial sustainability, and there is a consensus that external regulations and control of local borrowing are necessary. This is done either through borrowing controls, including individual borrowing limits and permissions, or based on control of the level of indebtedness and control of the current budget, which needs to include resources for servicing debt on capital projects.

The conclusion is that the relatively small share of local government debt is driven by legal restrictions imposed to local borrowing because typically local governments are allowed to borrow only for the long term to finance capital investment ("golden rule").

Local administration; Municipalities

## Definition

The organizations that provide public services in a particular town or area, controlled by officials chosen in local elections.

## Introduction

Local self-government is one of the most important institutions of the contemporary society. Today it is simultaneously considered as a form of citizens' participation in public affairs (an element of the civil society), as one of the levels of public power, and as a constituent of the market economy (delivering certain services to citizens). In the Russian history, there was no gradual evolutionary development of the system of municipal government, natural for the development of local authorities in most of the contemporary developed countries. It had been eventually replaced by a rigid centralization and total lack of independence at a local level during the Soviet period. Nowadays under the conditions of reforming, the system of local self-government in Russia is still on the way of searching for its effective forms and models, so the researchers and experts of public administration pay significant attention to domestic and foreign experience of local authorities functioning.

## History of Local Governments in Russia

The system of self-government accomplished by population had been developed as a result of the reforms in nineteenth century. The Russian Constitution of 1993 has established as a matter of fact a unique status of local government. The Constitution has excluded it from the system of State government bodies and stated that the structure of institutions of local government is to be established by the population independently.

## The Structure of Local Government

The number of Russian local governments continues to increase and the geographical coverage expands. As a result of the transition to a two-level model of local government organization, the first level being municipal districts and city districts and the second level being urban and rural settlements within municipal districts, the number of municipal entities in Russia more than doubled from 2005 to 2006, from 11,733 to 24,372. City districts are local governments in urbanized areas within the other regions. Municipal districts generally cover larger areas that range from urban to rural; these units resemble American counties in their geographic coverage (Zhuravskaia 1998). The lower-level units exist only within specific portions of municipal districts. They are urban and rural settlements, providing more localized services within municipalities to their populations. The most numerous type of municipality is the rural settlement (82%), followed by urban settlements, municipal districts (7.4%), and city districts (2.2%). This structure may be explained with the following example. Belgorod Oblast is one of the 83 regional governments. Within the Belgorod Oblast, there are 309 primary localities, including 19 municipal districts; 3 urban districts, 1 of which is Belgorod City; 25 urban settlements; and 262 rural settlements.

Local self-government in Russia is highly decentralized. It is usual to begin a discussion of local self-government with the observation that there are more than 24,000 municipalities of

different kinds across the country as a result of the continuing municipal reform. Local self-government is represented by quite a complicated labyrinth of overlapping jurisdictions including cities, towns, rural settlements, and rural districts.

Local self-government has been supposed to accomplish its own powers. According to the constitution, local self-government in the Russian Federation ensures the independent solution by the population of the issues of local significance. The local self-government bodies independently manage municipal property; develop, adopt, and manage the local budgets; introduce local taxes and dues; and carry out other local functions. Local governments may also be vested by law with certain state powers and receive the necessary material and financial resources for their implementation.

These constitutional regulations, and also the ratification of the European Charter of Local Self-Government by Russia in 1998, have served as a powerful spur to renew the interest to search for an optimal model of local self-government which would consider domestic traditions and realities and at the same time correspond to the world standards.

## Russian Municipal Reform

The contemporary stage of the Russian municipal reform is rooted in a fundamental work of the Russian Government commission on delimitation of powers between the federal, regional, and local authorities initiated by the President Vladimir Putin in 2001. One of the outcomes of this work was the adoption of the Federal law "On the General Principles of the Organization of Local Self-Government in the Russian Federation" in 2003 which has changed local self-government institutions significantly. The developers of this law have managed to achieve a reasonable combination of positive aspects of more than 10 years' of experience of local self-government functioning in contemporary Russia and the elements of the organization of the local authorities best practices taken from abroad. Thus, what has been put into the basis of the bill was the German model of local government which combines a variety of forms of realization of local authority and a significant regulation by the state.

Basically the municipal reform has been driven by three major goals: (1) to bring local governance closer to citizens, (2) to determine clearly local government competences, and (3) to ensure that the financial resources match the functions of local governments at each level. The key ideas of the local self-government reform have been articulated in the certain law provisions.

First, the reform has changed the status and the boundaries of numerous Russian municipalities by introducing a new so-called two-tier model which includes three types of territorial entities: settlements (urban and rural), municipal districts (roughly equivalent to a county in the USA or a *Landkreis* in Germany), and city okrugs (cities standing somewhat apart to cover a range of issues of local significance of both settlements and municipal districts). The establishment of settlement boundaries has been based on the two types of criteria: (1) the population of about 1000 inhabitants (so, the rural settlement may contain several villages) and (2) the walking accessibility of local authorities located in the "administrative center" from any part of the settlement within half of the working day. These criteria consideration makes possible to ensure accessibility and accountability of municipal authorities to the population and to adapt services to local needs; while larger structures (municipal districts) carry out financial equalization and create favorable conditions for strategic development (*Problems of Reforming Local Self-Governance: Structural and Financial Aspects and Moscow* 2005). Besides, on the basis of urban settlements, it is possible to establish urban okrugs, which represent the one-level model of municipal entity combining the functions of both settlement and municipal district.

Municipalities are assumed to be equal with no subordination between a municipal district and settlements composing it. As a result of the reform, the total number of municipalities has more than doubled to 24,035. Among them there are 506 city okrugs, 1809 municipal districts, 1746 urban settlements, and 19,738 rural settlements. Alfred Evans, American researcher,

mentions that a tremendous increase in the number of local governments will ensure sharp growth in the number of municipal officials and a substantial expansion of the need for financial resources to support the staff, facilities, equipment, etc. of the new local governments (Evans).

However, the two-tier model implies, on the one hand, to ensure the closeness of the authorities to residents and, on the other hand, the necessary concentration of resources. Such a combination creates the conditions for delegation of a considerable set of functions to the local level and raises its political and social significance.

Consequently, the other essential reform goal was to revise the limits of local government competences in order to consider the actual abilities of both levels of local self-government and to ensure the availability and quality of vital local services.

Before the municipal reform implementation, the Russian legislation provided for a unified list of local self-government powers regardless of the territory status and size which caused reasonable doubts in equal abilities of a small village as compared to a big city. Moreover, because of the legislation ambiguities concerning specific local functions, local self-governments run a heavy deficit of financial resources and as a consequence had no capacity to carry out all their responsibilities.

Owing to the municipal reform, there were two lists of issues established of local significance that define the limits of local government competence according to the type of municipality. Thus, the law vests culture and sport facilities, road construction, parks and recreation, land use planning, housing, water disposal, heating, electric power, gas and fuel supplies, area improvement, garbage collection, and other utilities in urban and rural settlements, while a municipal district focuses mostly on health care, general and supplementary education, preschool education, and provision of equal budget revenue supply among settlements.

There are also several issues that can be called "inter-municipal": they imply intersection of competence of all types of municipalities. In such cases the law divides powers between settlements and municipal districts by stating the "inter-settlement powers." For example, as far as housing and utility sector is concerned, municipal districts have to arrange electric power and gas supplies up to the boundaries of settlements and to arrange recycling and processing domestic and industrial wastes.

In order to make municipal service delivery effective, the law also provides the lists of municipal property categories for each type of municipality that can be owned and used to implement the powers of local governments. The property owned by municipalities which is not being used to carry out local government functions should be changed in use or alienated by 2012.

To achieve all reform objectives, a transition period has been set in order to provide gradual implementation of the federal law provisions. Initially this transition period has been established for 2003–2006, but due to certain ambiguities in legislation and different readiness of territories, the law has been fully enacted in 2009. However, the enactment of the law does not mean that the municipal reform is completed. As far as key issues of the reform are not solved, it remains a continuous process of adjustment of local self-government forms and models, local authorities' responsibilities, and optimization of legislation and intergovernmental relations.

Leonid Davydov, the Chairman of the Commission on Local Self-Government of the Public Chamber of the Russian Federation, says that the contradictions in legislation which is also being constantly amended, the insufficiency of financial resources to implement local governments' functions, the lack of well-trained personnel, and the "administrative pressing" have seriously decreased the effects of the reform (Public Chamber of the Russian Federation).

## Fiscal Autonomy of Local Governments

Indeed, although the principle of fiscal autonomy and of sufficient funding has been stated in law to enable municipal governments to satisfy the obligations that have been imposed on them, more significance has been attached to equalization of revenue supply mechanisms at the levels of municipal districts and regions rather than to the provision of an adequate local tax base. Two local

taxes – land tax and property tax – do not cover all the expenditures of local governments.

As a result, most of the revenues come to local budgets not from their own sources but as financial aids from upper levels of budgetary system mainly having special purposes. Consequently local governments do not have enough income to carry out their functions under the law, and the inconsistency between the stated responsibilities of local self-government and its financial capabilities becomes their greatest problem.

In this situation municipalities must rely on transfers from the federal and regional budgets in order to try to perform the functions that are expected of them. Besides, this brings the issue of municipal independence to the political agenda.

The problem must be solved by elimination of senseless circulation of revenues from local society to the regional and federal budgets and back. The true independence of local budgets can be provided only by legally stated local revenue sources like taxes and dues.

One of the primary reasons of the situation is a certain contradiction between the local government reform and the processes of centralization of public administration launched in 2000s. As the Institute of Contemporary Development reports, the newly created settlements have appeared to be out of real financial, infrastructure, and human resources and have been forced to perform and at the same time struggle with the endeavors of the upper levels of public power to concentrate on the resources while the responsibilities were being transferred down (Public Chamber of the Russian Federation).

Because of the ongoing process of delimitation of powers, the law "On the General Principles of the Organization of Local Self-Government in the Russian Federation" is being constantly amended with regard to the issues of local significance – the lists of mandatory powers. Therefore the municipalities became responsible for the implementation of more powers than were stated initially, in spite of the lack of resources, regulation abilities, and decision-making rights. Most of these responsibilities have never been inherent to the local self-government in Russia: agriculture development assistance, small-scale enterprise assistance, preventing terrorism and extremism, and public defense.

Besides, in the conditions of ambiguity of certain legislation, the higher levels of authority try to assign their responsibilities to local governments without providing sufficient funding to carry out those duties. Moreover, there can be traced the tendency of suppression by regional and district authorities of the capability of local self-government to resolve questions of local significance independently.

Although the law provides for equality of municipalities, subordination relations between heads of regions and mayors of municipal districts and between mayors of municipal districts and mayors of settlements remain widespread. Often settlement governments are forced by the regional governments to delegate their powers to municipal districts by contract. According to the official data among the powers which are usually delegated from settlements to municipal districts, there are such essential functions as development and implementation of budget, settlement development plans, zoning, and construction rules development (Ministry of Regional Development of Russian Federation). Obviously, this fact reveals the lack of certain professional skills at the settlement level, but it is also important that the delegation of key functions intensifies settlements' dependence on municipal districts.

The continuing increase of local governments' responsibilities is also supplemented by the recent trend to involve municipalities into the public administration reform. Today all the local administrations are expected to adopt their "anti-corruption" plans and programs, to develop e-government technologies and to provide e-services.

One of the underestimated issues of contemporary local self-government in Russia is the "living of local societies at the political periphery" (Public Chamber of the Russian Federation). The interest to the municipal reform is not systematic. When the reform has been officially finished, local government has found itself out of the political agenda. It is quite typical for the public administration elite of the central government to think of the local self-government as of the topic of "little significance"

and to transfer all the discussions on local affairs to the regional level.

## Conclusions

The centralization trends, the state control over the municipal resources, and the lack of the incentives to development of local self-government give birth to psychological dependence, apathy, and the lack of the initiatives in local communities (Ermasova and Mikesell 2016). Solution of the abovementioned problems is not a local issue. It concerns the very essence of the public policy in Russia; its goals and priorities on the way of creation of a decentralized, democratic law-bound state; and the development of the civil society.

In his address to the Federal Assembly on December 12, 2013, the President of Russia paid much attention to enhancing and renewing local government. He emphasized the clarification of the general principles of local government organization and development of strong, independent, financially sustainable local authorities as the most important task for today. President's proclamation of the ensuring of balance of responsibilities and resources at the local level in accordance with common sense as the priority of the public policy can definitely give a necessary impetus to the improvement of the division of powers between levels of government, the principles of financial support of local governments, a comprehensive state support of local self-government – one of the most important social institutions – and the foundation of public authority in Russia.

## Introduction

Brazil is a federation with a presidential government, a bicameral and multiparty legislative branch, and an independent judiciary with the prerogative of constitutional review. Its subnational government structure is divided into 26 states and 1 federal district that choose their respective governors and legislative assemblies. It has 5,570 municipalities, governed by a mayor, secretariats, and a municipal legislative chamber, elected by proportional representation. Mayors are elected for 4-year terms, with the possibility

of one reelection, in elections held during periods that do not coincide with federal and state elections. The quorum required for the election of municipal mayors is *plurality* in municipalities with less than 200,000 voters and *majority runoff* in cities with a constituency above this threshold. Each municipality has a municipal organic law, approved by a vote of two thirds of the municipal legislators, which establishes the guidelines for the functioning of municipal governments, obeying the jurisdictions determined by the Federal Constitution (CF).

Among these 5,500 municipalities, almost half (44%) can be classified as micro-municipalities, with less than ten thousand inhabitants each. However, the population of these micro-cities represents just over 6% of all Brazilians. At the opposite extreme, there are 300 large municipalities with more than 100 thousand inhabitants, which although they are only 5.4% of the local administrations, they make up more than half the national population.

The Federal Constitution of 1988 significantly expanded the prerogatives of municipal governments, enabling them to legislate about local problems, make decisions regarding the creation of municipal taxes and the application of tax revenues, promote land use planning through urban land planning and control of use and occupation, and carry out the concession of public services, especially those related to public transport, to be responsible for basic and infant education, health services, basic care of the population, and protection of the local historical and cultural heritage (Grin and Abrucio 2018; Marenco and Noll 2018). All cities with a population over 20 thousand inhabitants must have a master plan approved by the city council, to be the basic instrument of municipal urban planning (CF, Art. 182, §1).

## Tax

Since 1988, there has been an increase in political decentralization with transfer of revenue, responsibilities, and administrative, fiscal, and political authority to subnational governments, which accompanied greater availability of financial resources generated by the increase in local revenue and intergovernmental tax transfers. Since 2003, voluntary transfers to municipalities exceeded the quota allocated to the states, revealing growing opportunities for obtaining revenue through joint agreements and programs with the Federal Government. At the same time, the municipalization of services transferred them greater responsibility for promoting local economic development and public goods.

The Brazilian federation can be characterized by a combination of political and administrative decentralization but tax revenue centralization (Arretche 2013). In terms of the jurisdiction of its generation, federal taxes collected were equivalent to 21.4% of the gross domestic product (GDP), greater than the revenue from state (8.9%) and municipal (2.4%) taxes (Receita Federal do Brasil 2016). The Federal Government is responsible for 53% of public revenue, leaving 25% for states and 20% for municipalities. However, it is important to draw attention to its evolution, considering the different federal entities: the centralized revenue of the Federal Government reached its peak in the 1980s, retreating after the new constitutional charter; states remained with stable fiscal revenue, while municipalities experienced a significant increase in tax revenue over the last 30 years (Fig. 1):

At the same time, the Federal Constitution (Art. 158 and 159) established mandatory transfers to municipalities: 100% of the revenue from the Rural Property Tax, 50% of the revenue generated by the Tax on Ownership of Automotive Vehicles licensed in each municipality, 25% of the collection of the Tax on the Circulation of Goods and Services, and the Income Tax paid to the Federal Government by autonomous administrative units and foundations in municipalities (CF, Art 158). On the other hand, constitutional provisions have linked the execution of municipal expenditures derived from federal transfer revenue and local revenue to minimum percentages, for education (25%) and healthcare (15%).

Municipalities have the competence to tax urban real estate property and its transfer and may set rates, exemptions, registration, and

**Local Governments, Brazil, Fig. 1** Composition of available revenue.xlsx. (Source: Receita Federal do Brasil (RFB))

collection of the Urban Land and Property Tax (IPTU) and the Tax on Property Transfers (ITBI). They especially depend on the collection of the Services Tax (ISS), which represents about 3% of national tax revenue, equivalent to 1% of Brazilian GDP. Next to it, IPTU is equivalent to 1.5% of the national tax revenue or 0.51% of the Brazilian GDP (RFB 2016). The importance of the "services" in the municipal tax collection, accounting for approximately twice the revenue from urban property, has consequences on the incentive for tax competition between municipalities and the regressive impact of taxation (De Cesare 2010). IPTU as a percentage of tax revenues for Brazilian municipalities has been on a downward trend. With 21.5% of the average revenue collected by municipal governments in 2002, this percentage has shown successive reductions, reaching only 14.2% of local tax revenues 10 years later, a 33.9% drop in the relative contribution of this tax for the local municipal revenue. Conversely, the Service Tax (ISS) increased its share from 33.3% in 2002 to 46.1% in 2012, corresponding to a 38.4% increase in its relative weight. In 2016, intergovernmental transfers accounted for 62.8% of municipal tax revenues, while the collection of local taxes accounted for only 16.3% of its funds. While large municipalities (above 500 thousand inhabitants) generate 38.6% of their revenue from their own taxes, in small cities with five to ten thousand inhabitants, only 4.9% of their tax revenue comes from municipal taxes, and 87.6% comes from federal transfers.

## Civil Service

Municipal governments can hold civil service exams, hire employees, and establish career plans and the salary policy for their employees. The number of employees in the direct and indirect administration of Brazilian municipalities increased from 4.8 million in 2005 to 6.6 million in 2015, which means that the equivalent of 3.2% of the Brazilian population in 2015 was working for municipal public administrations (Instituto Brasileiro de Geografia e Estatística, IBGE 2015). During this period, the average expenditure on active personnel made up 55.5% of the current municipal expenses. On the other hand, the scale of the municipal public service is strongly correlated with the size of the local population ($p = 0.95$ ***) and budget revenue ($p = 0.92$ ***) (IBGE 2015).

The composition of the public service in Brazilian local governments, according to different types of careers, education level, and size of municipalities, can be examined in the Table 1 below:

**Local Governments, Brazil, Table 1** Municipal public employees, according to employment type/education/size of municipality (in %, 2015)

| Type | Education | Municipal population (thousand inhabitants) | | | | |
|---|---|---|---|---|---|---|

Public employees in municipal governments have different types of employment, based on the type of contract, with different structures and levels of career stability and professional and labor prerogatives, establishing different degrees of autonomy for public bureaucracies in relation to governmental authorities. *Statutory* civil servants constitute the most *professional* segment of the public administration, with selection subject to a civil service exam, and are granted stability after 3 years of employment. Employees hired under the Consolidation of Labor Laws (*CLT*) have a similar status to those in the private sector. Employees *without permanent contract* are those who work as service providers, without an employment relationship and without a signed worker card, including the self-employed, interns, volunteers, and those assigned by other administrations; *appointed positions* are similar to the *spoils system*. Due to the absence of indicators and parameters regarding merit, knowledge, and technical performance that allows comparisons in all municipal administrations, schooling offers a *proxy* for public servant preparedness, qualification, and potential availability of technical and informational resources for public management.

About three-fifths of public servants in the Brazilian municipal administrations are *statutory*, entered through a civil service exam, and have job stability in the position after remaining 3 years on the job. Considering their distribution in relation to education, there is a trend of a reduction in the participation of statutory employees with elementary education as the size of the municipality increases, falling from 16.2% in micro-municipalities to 9.5% in large cities. Statutory employees with a high school education show no variation in their participation based on the size of the municipality, while those with university education maintain a stable proportion in micro-, small- and medium-sized administrations but an increase to 29.2% in cities with more than 100 thousand inhabitants.

Statutory employees with university education are the closest to a government bureaucracy profile based on professional careers and technical performance. Admission to public service through tests and competitions, job stability, and long-term administrative careers associated with the technical knowledge and information offered by higher education would be some of the main features in establishing a process for the professionalization of modern professional bureaucracies.

Three trends stand out when we see the movements in the profile of the municipal employees over the last decade: (1) an increase in the relative share of employees with higher education, regardless of the type professional or administrative ties;

(2) growth of employees with no permanent ties in all municipal administrations, driven by individuals with university or high school education; and (3) a decrease in the share of local administration members with elementary or high school education (in this case, with the exception of those without permanent ties).

## Politics

An obligatory reference regarding municipal politics in Brazil is the works of Leal, identifying a combination of economic and financial decadence of the municipalities, combined with the political and administrative centralization of the states, resulting in dependence of local governments on the state and federal government and the establishment of a chain of vertical subordination between governors, municipal political leaders, and voters (Leal 1975). However, Leal himself cautions against the possibility of changes in this scenario: "We can even imagine an unforeseen situation, namely, the establishment of direct contacts between the municipalities and the Federal government. In this case, a new type of commitment could be made, no longer in favor of state situations, if not precisely against them" (Leal 1975: 257). In a similar vein, Hagopian (1986) mentions the changes brought about by state centralization over traditional patronage based on land ownership, toward a pattern of clientelistic exchange, in which control over public resources (jobs and money) becomes the stronger political currency.

Thus, we must consider the consequences of the institutional arrangements of intergovernmental relations on the level of competition in local politics. One initial factor is regarding the electoral calendar. The election of presidents, governors, and mayors of capitals and cities classified as security areas was interrupted by two decades of authoritarian rule, with the indirect appointment of those seats transferred to electoral colleges under the control of the military government. Therefore, elections for state governors were only held again in 1982, at the end of the authoritarian regime, and direct presidential elections, only in 1989, 4 years after redemocratization. On the other hand, elections for municipal governments in the great majority of small- and medium-sized cities did not suffer interruption, even during the period of authoritarian rule (1964–1985). Thus, three elections for municipal governments (1968, 1972, and 1976) were held during the authoritarian regime and before the return of the elections for state and national authorities. The expected effect of this sequence [local > state > national] can be seen in the reinforcement of local bonds of loyalty, which happen in the disputes over the only executive seat not interdicted by the military. On the other hand, after the redemocratization, the calendar of national elections is on two different cycles: municipal elections for mayors and legislators are held in different years than the election of federal and state representatives (president, senators, federal representatives, state governors, state representatives), which should reinforce a localist dynamic for the municipal competition (Falleti 2010).

The identification of degrees of electoral dominance may provide an indicator of the type of political competition in Brazilian local governments. By electoral dominance, we mean the percentage of votes obtained by the winning party in each election for the municipal government. The winning candidate's percentage of votes provides an indicator to measure the degree of competition and the party's ability to establish broader loyalties and neutralize rival competitors, reducing the space of the opposition. In other words, it makes a difference if a mayor is elected with less than 50% of the valid votes – indicating the presence of strong opposition and significant electoral competition – or, in an opposite situation, a municipal government with more than 50% support, revealing a fragile opposition and reduced electoral competition.

Figure 2 provides an overview of electoral dominance in the last five municipal elections in Brazil:

In all the elections observed, the median values corresponding to the voting obtained by the candidates and victorious parties in each of the 5,500 Brazilian municipalities stood above 50%, a

**Local Governments, Brazil, Fig. 2** Electoral dominance.xlsx. (Source: Tribunal Superior Eleitoral (TSE); Instituto Brasileiro de Geografia e Estatística (IBGE))

significant result considering that in 98.3% of the administrations with less than 200,000 voters, only a simple majority is required for the victory. In the upper quartile of the distribution, there are cases where the winning party obtained between 60% and 75% of the votes, with outliers that reach close to 100%. The variation in the lower quartile indicates cases with an electoral victory with only 1/3 of the votes.

More competitive scenarios with winners obtaining less than 50% of the votes correspond to an expected behavior: they are less frequent in micro and small municipalities, where the demographic scale, concentration of economic opportunities, or restricted access to information makes it difficult to establish a pluralistic and competitive electoral arena, but happens more frequently (around 40% of cases) in large municipalities. While for micro and small municipalities the explanation may be a demographic scale that reinforces ties of personal loyalty, the presence in an equivalent proportion of elected officials with more than 50% of the votes in large municipalities in the 2008 and 2012 elections may represent a challenge to understanding of the phenomenon. To explain it, one must remember changes to the election rules for executive governments introduced by the 1988 Constitution. Since 1990, the election of mayors in municipalities with more than 200,000 voters (large municipalities, therefore) occurs by majority runoff, with a second round of voting when none of the contestants reach 50% plus one of the valid votes. Instead of increasing the fragmentation in the supply of candidates, this has provoked anticipated electoral coordination, with the promotion of *large coalitions* already during the first round. At the same time, a new change in electoral legislation, allowing the immediate reelection of incumbents, reinforced their potential to remain in office, multiplying the coordination capacity of large electoral coalitions. In order to reduce uncertainty caused by a second round of voting, *incumbents* promote oversized coalitions, a phenomenon that occurs with high percentages of votes obtained by winning candidates, even in large municipalities.

## Conclusion

Brazil has more than 5,500 municipalities, with local governments that have had their political,

administrative, and fiscal responsibilities and prerogatives expanded since the Federal Constitution of 1988. The composition of public service in Brazilian local administrations shows an increased professionalization trend, with a predominance of statutory employees that enter by civil service exam and acquire job stability after 3 years of activity. Political competition reveals patterns of electoral dominance, translated into a trend for votes to be concentrated in the victorious coalition.

## Definition

Law enforcement: It is the prevention, detection, and investigation of crime and the apprehension and detention of individuals suspected of law violation. This includes the individuals and agencies responsible for enforcing laws and maintaining public order and public safety (Bureau of Justice 2016).

## Introduction

Society is organized around a set of rules, known as laws. Laws provide structure to our lives and provide boundaries of acceptable behavior. Laws are created by government and implemented by the bureaucracy. Various iterations of police are responsible for ensuring people are following the laws. These agencies attempt to prevent crimes from occurring and to protect people from criminals as well as to apprehend and prosecute lawbreakers. Law enforcement agencies operate at all levels of government, including at multiple levels within states. Agencies such as the Federal Bureau of Investigation (FBI) or the Drug Enforcement Agency (DEA) operate at the national level. Within states, there are county police departments, highway patrol divisions, and, in some states, marine or border patrol organizations.

Broadly speaking, police departments have two mandates. The first is order maintenance. In this function, police officers respond to calls, such as domestic violence or robberies, and work to

resolve those situations as they arise (Wilson 1968). The second is to enforce the laws. This involves investigating crimes and apprehending and detaining criminals (Wilson 1968). A crime-free society would be ideal but is realistically impossible to achieve. In pursuit of that ideal, law enforcement agencies face many challenges, including effectively achieving their mandates, respecting individual rights and freedoms, balancing effective enforcement with bureaucratic discretion, and being sensitive to racial and class-based distinctions within communities.

## Management and Administration of Police Departments

Law enforcement agencies are part of the state bureaucratic apparatus and therefore feature a hierarchical administrative structure. Metropolitan police departments are generally overseen by a chief of police or a police commissioner. The chief or commissioner is usually appointed by the city's mayor. In large cities, there may be multiple ranks of chiefs or commissioners, and those positions may be two separate roles with distinct duties. County police departments are often supervised by a sheriff, which is an elected position. This is an important distinction in that police chiefs or commissioners answer to the mayor, while sheriffs have more autonomy as they are elected in their own right. The next level in the law enforcement hierarchy, directly under the chief, commissioner, or sheriff are ranks of officers, including lieutenants, sergeants, and detectives. Each position carries its own duty-based responsibilities, and depending on the size of the department, each rank may carry varying supervisory responsibilities.

The majority of order maintenance work is done by street-level officers. Police officers perform a variety of tasks in their work, including initiating traffic stops, providing first-responder medical attention, and responding to disturbances, and sometimes more mundane tasks, such as rescuing cats from trees and filling out a great deal of paper work (Wilson 1978). Street-level officers patrol beats, or limited geographic areas, in which the officer becomes familiar with the residents and patterns of activity. Historically, officers would walk their beats, but technological advancements, especially those related to personal transportation, have led to officers patrolling much larger areas. In some instances, this has disconnected officers from their communities, in that instead of walking a beat, now they now drive in patrol cars. Because of this, officers have fewer opportunities for ordinary interactions with community members, and community members have fewer opportunities for ordinary interactions with police officers. In some communities, this has led to disconnect between police and the people they serve, resulting in decreasing levels of trust on both sides. In racially diverse communities, this is can be particularly problematic. This dynamic is discussed more thoroughly in the section below.

Some law enforcement agents are more specialized, in charge of investigating specific categories of crimes. These actors perform more of the for the law enforcement mandate of police work. Detectives are the agents who are largely responsible for this investigative work. Detectives may investigate burglaries, assaults, murders, or any other serious incident which may occur. In larger cities, detectives may be specialized, with units responsible for investigating particular categories of crimes in a given area. Some states organize specialized units to deal with particular issues unique to that geographic region. For example, in Arizona, special units are responsible for patrolling the border in an effort to prevent illegal immigration. In Maryland, a special division of the police is responsible for patrolling the harbor. And in California, some lifeguards are part of police units. This variability illustrates the authority that individual states have in addressing particular problems they face.

Some localities are patrolled by federal agencies. For example, communities located on federal lands may be policed by rangers who are part of the US Forest Service (USFS) or National Park Service (NPS). Other localities, such as Native American lands, have overlapping police agencies. Reservations are broadly managed by the Bureau of Indian Affairs (BIA) in the Department of the Interior (DOI), which helps manage some

aspects of tribal law enforcement. Law enforcement on tribal lands is complicated because since the 1978 Supreme Court case *Oliphant v. Suquamish Indian Tribe*, tribal police do not have jurisdiction over non-tribal members. Non-Natives who commit crimes on tribal lands can only be arrested by state police. Over time, this led to a culture of impunity among white men in particular who lived on or near tribal lands. As of 2012, 86% of rapes of Native women were perpetrated by non-Native men (Crane-Murdoch 2013). Tribal police were legally unable to prosecute the offenders, resulting in nearly no arrests of the criminals, and no justice for the victims. In 2013, Congress added special language to the Violence Against Women Act which allows tribal police to prosecute non-tribal members for domestic violence, dating violence, and the violation of protection orders (Wilson 1978). This Act helps empower local law enforcement to address problems in their communities, though it still leaves wide gaps in the administration of justice on tribal lands.

Police are generally given wide discretion in performing their duties. Police officers spend their days largely away from centralized command and are responsible for their own reporting regarding their activities for the day. This means that officers have the power to determine which crimes to report and which to ignore. This can lead to controversies in some communities regarding bias in police practices. This raises an important question: Who polices the police? The answer is different depending on the community.

In some communities, police oversight is managed almost entirely by police departments themselves. Particularly in small departments, police leadership may be responsible for investigating complaints against officers. Many large departments have a special division, called internal affairs (IA), which investigates police officers suspected of breaking the law. These divisions are somewhat controversial in police departments, as they take authority away from unit managers and place that authority with an outside group (Gottschalk 2010; Wilson 1978). Many communities also feature some type of civilian oversight of police. The presence of civilians on police oversight boards or commissions has been one way for communities to address complaints against police, particularly related to concerns from minorities. The power of civilians varies widely across communities. In some areas, one civilian participates in general police review procedures, while in other areas, boards comprised only of civilians have power to review complaints and make serious policy recommendations to city leadership (Gottschalk 2010). Police oversight is an important element of police administration and management, though it can be a source of contention when police feel their ability to adequately perform their duties is compromised or when citizens mistrust police because they appear above the law themselves.

## Controversies in Law Enforcement Practice

A major controversy in law enforcement practice is the prevalence of corruption in police departments. In some cases, this may consist of misreporting crime statistics in order to create the appearance of crime reduction. Policing a community involves giving a great deal of autonomy and discretion to individual police officers (Gottschalk 2010). Most police work happens outside the view of supervisors or the general public, meaning we trust that police officers will accurately report the details of their work. However, police are tasked with reducing crime, and if reductions are not shown, the department may be accused of ineffectiveness. This incentivizes police officers to not file official reports of crimes or misrepresent the nature of a crime in order to reclassify it as a different type of offense (Wilson 1968). The public wants a police force that will prevent crimes, but crime prevention is impossible to measure. Police can report a reduction in the number of arrests or calls, but there is no way to determine how many crimes did not happen as a result of policing. Wilson (1968) argues this type of corruption could be prevented if the public would lower expectations of police performance, and if police would focus more on the order maintenance rather than law enforcement function of

their profession. On the other hand, there must be a way to hold police accountable for performing their duties, and the current standards of performance for bureaucracies are measured by numbers and statistics.

Another, more serious, place of corruption in police departments involves law enforcement officials abusing their authority. Measuring instances of police misconduct is rife with methodological issues. Many charges against police officers, such as excessive force, are subjective, and it ultimately falls upon police departments themselves to determine whether or not an officer crossed the line (Adams 1959). This is further exacerbated by differences in reporting requirements across states. Each state is largely responsible for setting its own law enforcement policies, meaning a bribe in one department might be an act of "hospitality, generosity, or appreciation" in another department (Gottschalk 2010). Police are put into difficult and dangerous situations as a normal course of their daily work and must have discretion in how to handle a diversity of situations as they encounter them. However, there is a tension between police discretion and individual rights, which is a difficult space for police to navigate under the best of circumstances.

Finally, the practice of law enforcement creates opportunities for police officers to commit crimes. This can include police officers accepting bribes, stealing or planting evidence, and withholding or lying about information to prevent arrest or conviction. Perhaps the most well-known example of this behavior is the Rampart Scandal that rocked the Los Angeles Police Department (LAPD) in the late 1990s. The department had implemented the Community Resources Against Street Hoodlums (CRASH) program to combat gang violence in the 1970s. The program was dissolved in 2000 after 70 officers were implicated in widespread criminal activity, including robbery, rape, perjury, and murder (Boyer 2001). Evidence suggests that the LAPD actively sought to obstruct the investigation of corruption charges against the Rampart division of the CRASH program. While scandals of this scale are relatively rare, this serves to illustrate the potential for disaster that exists when police departments are not adequately supervised.

## Race and Law Enforcement

Perhaps the most controversial aspect of law enforcement is the relationship between police and certain racial or ethnic groups. Allegations of police bias are widespread, and statistical evidence does support the idea that racial minorities are more likely to be stopped by police. This phenomenon has been most widely studied as it relates to African-American populations. African-Americans represent about 13% of the US population but comprise 28% of arrestees, 31% of officer involved shootings, and 28% of people killed by police every year (Mullainathan 2015).

Incidents of police violence against racial minorities are not new but have gained more attention recently after the high-profile deaths of Trayvon Martin in 2012 in Florida and Michael Brown in 2014 in Missouri. Brown's death in particular set of months of unrest in Ferguson, Missouri, where African-Americans are the overwhelming majority of the population, but the police department is overwhelmingly white. These incidents, and many others, have led to calls for reform of the American justice system. Many activists believe the War on Drugs, which began in the 1970s, should officially be ended. The War on Drugs was initially implemented to stop soldiers in Vietnam from using drugs but has evolved into a widespread, multiagency pursuit. The War on Drugs includes many policies related to the legality of certain substances and the punishments for possessing them. Critics claim the War on Drugs has created a culture of mistrust between police and the communities they serve, particularly minority communities, which makes them less likely call the police to maintain order. The War on Drugs largely ties federal police funding to the number of drug-related arrests a department makes, which incentivizes police misconduct and has exacerbated the already tense relationship between police and minority communities. Other reformers have called for changes to police recruiting and training procedures, which some argue teach police cadets to hone in on minority populations. It is unclear exactly what reforms would be successful in

reducing tensions between police and minority communities, but minorities are vocal in their discontent on this issue, and ideally these groups will be able to work out a solution that restores faith in police abilities to fairly maintain order in America.

## Conclusion

Police departments are essential for maintaining order and enforcing laws in American communities. There are many levels of police, and departments are generally hierarchically organized to maintain supervision and stability within departments. In most places at most times, police do their job without controversy, but some departments suffer from persistent problems with corruption and criminality within their ranks. Police departments have long been accused of racial bias in their conduct, and there is some evidence to support these assertions. However, the problem of racial bias in America is not solely one of law enforcement, and while police departments may be a major site of discrimination, they are not alone in dealing with this issue. Some activists feel that police departments are an ideal place to begin implementing reforms dealing with racial discrimination. A good place to start may be incorporating more minority officers into police ranks, particularly the higher ranks of a department. Law enforcement would benefit from heeding the advice of critics rather than closing ranks, and community members would benefit from making their expectations of police match the realities of the modern world.

# Local Politics

Markie McBrayer
University of Houston, Houston, TX, USA

## Definition

Allocational policies: policies that have little or no effect on the locality's economy.

At-large elections: in the local context, at-large elections involve the whole city electing a councilmember, who then represents that city.

Council-manager systems: The city manager (an appointed position) maintains much of the budgetary and administrative powers that were originally with the mayor in mayor-council systems, meaning that the mayor has less institutional strength than if he or she were in a mayor-council system. In council-manager systems, the mayor is sometimes selected from among the councilmembers.

Developmental policies: policies that promote local economic growth.

District elections: in the local context, only a geographic portion of the city (known as a district or ward) elects a councilmember that represents the district or ward.

Mayor-council systems: in such systems, mayors are typically vested with more administrative and budgetary power and are elected separately than the council.

Multilevel regression and poststratification: an empirical strategy that involves aggregating public opinion polls, then modeling survey responses as a function of both individual-level characteristics and geography. Then, in the poststratification stage, the estimates are weighted by the proportion of those fitting the individual and geographic characteristics in the locality.

Pluralism: political competition among groups that results in compromised policies.

Redistributive policies: policies that favor relatively disadvantaged groups at the expense of more advantaged groups and, ultimately, of the city's economic development.

Reform institutions: changes brought about to political institutions in the late nineteenth and early twentieth centuries in order to remove what was perceived to be the deleterious effects of political machines. Reform institutions include at-large elections (as opposed to district-based elections), council-manager (as opposed to mayor-council) systems, and nonpartisan elections (as opposed to partisan elections).

Regime theory: In this theory, power is thought to be distributed across different groups and actors in a city, with the local government maintaining some power and private industry retaining some as well. Thus, it is only when the market and state form coalitions that policies are created and implemented.

## Introduction

Local politics and policies are often the frontline of government with which citizens and residents have the most interaction. Tuesday morning, the municipal solid waste department collects trash. On the morning commute, city workers fill a pothole. And at night in warmer climates, the mosquito control district sprays pesticides to lower mosquito populations. There are countless other ways that citizens and residents interact with their local government on a daily basis, and yet, the fields of political science and public policy often focus their research at the national or state level.

The following is a brief survey of the current literature on local politics and policy. It begins with an exploration of different models of local governance – the groups that are most likely to maintain local political power. Second, this brief discussion examines the effects of local governance on responsiveness and the bureaucracy. Research on local policies is then surveyed, including policy typologies used in the literature, service provision, and operationalization of policy. Finally, this entry concludes with recommendations for future areas of study.

## Local Governance

In the study of local politics, traditional models and theories of who governs include pluralism, the economy, regime theory, and institutions. The following explores each model and its implications for representation. The subsequent section will explore recent empirical research that bears out these theories.

First, pluralists argue that local officials are interested in gaining (re)election and in order to do so must enact and reflect their constituents' preferences. Local politicians then enact policies that embody the competition (and compromise) among different groups and their policy preferences. Pluralism is popularly derived from Robert Dahl's *Who Governs* (1961), in which he examines how political power, in New Haven, Connecticut, was dispersed among a variety of groups in the area, none of which had full control of the political process: for instance, Yale University and New Haven's business district competed against one another for policies and control, yet no interest dominated the local government. While there were inequities among groups, Dahl's research stands in stark contrast to the

predominant, more elitist perspective that the political process is likely to be dominated by one group.

The second theoretical framework, the economy, is quite the opposite of pluralism. Instead of constituent preferences competing among one another to be represented, local politicians are largely constrained by economic considerations. That is, city governments will not levy high taxes or pursue significant redistribution because it is thought that it will drive away wealthy residents and municipal capital (Peterson 1981), as cities tend to compete for residents (Tiebout 1956). Ultimately, cities are motivated to seek out and keep middle-class and wealthy individuals and businesses through lower taxes and greater economic development, while avoiding redistributive policies. This theory would suggest that local officials are less inclined to equally represent all constituent interests and would rather pursue policies that favor business interests and middle- and upper-class constituents.

The third theoretical framework is derived from Stone's (1989) regime theory, which in many ways is a compromised view of both pluralism and the economic perspective. Power is thought to be distributed across different groups and actors in a city with the local government maintaining some power and private industry retaining some as well. It is only when the market and state form coalitions that policies are created and implemented. Much of the regime theory research in urban politics focuses on the formation of these coalitions. Using this theoretical framework, one would expect for municipalities to favor the policy preferences of business interests and wealthier individuals in the area. Yet, political officials will still need to please the electorate more generally, given that their support and votes are required to remain in power.

Finally, there are two strands of institutional literature that examine how institutions influence local representation – the effect of reform institutions and how higher levels of government affect local government. First, institutions, whether they are reformed or not, are thought to affect those who maintain political power. In the late nineteenth and early twentieth centuries, many cities began reforming their local political institutions in order to remove what was perceived to be the deleterious effects of political machines. Yet, reform institutions are also considered to be means by which to disenfranchise marginalized groups and members of society – immigrants, minorities, Catholics, etc. Reform institutions include at-large elections (as opposed to district-based elections), council-manager (as opposed to mayor-council) systems, and nonpartisan elections (as opposed to partisan elections). At-large elections involve the whole city electing a councilmember, as opposed to the ward or district-based system, in which only a geographic portion of the city elects a councilmember. In council-manager systems, the mayor has less institutional strength when compared to the mayor-council systems. Instead, the city manager (an appointed position) maintains much of the budgetary and administrative powers that were originally with the mayor in mayor-council systems. Moreover, the mayor may be selected from among the councilmembers and has similar powers as members of the council. In mayor-council systems, the mayor is often elected separately from the city council, and the mayor maintains significant administrative and budgetary power. For the most part, literature shows that these new reform institutions tend to disenfranchise minority voters and discourage the election of minority political officials, suggesting that cities with reform institutions are less representative of minority interests.

The second strand of institutional scholarship argues that local governments are constrained by higher levels of government (i.e., state and federal government). Certainly, the funding and grants that municipalities receive from the state and federal government often have very specific guidelines about how the funds must be spent, and thus, the local government has little discretion in policies to be pursued. Moreover, cities often derive their autonomy from the state, meaning that the will of the state government reigns supreme over the politics and policies of the municipality. For instance, Birmingham, Alabama, recently passed an ordinance that would increase the minimum wage in the area. But, as of February 2016,

Alabama's state government swiftly overturned the ordinance before the policy went into effect. Thus, local politics (and policies) are heavily constrained by higher levels of government, perhaps leading to weaker connections between constituents and their local elected leaders.

## Consequences of Local Governance

More recent urban politics research provides some evidence for all the aforementioned theories, especially with regard to policy. In modeling all four theories, Hajnal and Trounstine (2010) find that economic considerations are quite important, and yet, institutional, political, and need-based considerations also have an effect, though more inconsistent ones, on policy. Gerber and Hopkins (2011) also bear out these inconsistent institutional findings when they conclude that the partisanship of the mayor has little effect on local policies, except in areas where local officials have significant discretion. They state that local officials are, for the most part, constrained by the state and federal governments when it comes to crafting and implementing policy. With regard to reform institutions, they may be less of an impediment to representation than previously thought, as Tausanovitch and Warshaw (2014) have recently found that institutions do not have consistently or statistically significant effects on the relationship between local policy preferences and policies.

Still, other literature finds that local officials are fairly responsive to the policy preferences of their citizens. That is, policies, especially spending, reflect the relative conservatism or liberalism of that locality's constituents. Previously, it had been empirically challenging to measure local policy preferences, with research relying on the presidential vote margin for a large number of localities (Choi et al. 2008), survey results from a small number of cities (Palus 2010), or, more rarely, surveys from a large number of localities (Einstein and Kogan 2015) to gauge local-level policy preferences. More recent research Tausanovitch and Warshaw (2014) has utilized multilevel regression and poststratification to ascertain more accurate estimates of local-level policy preferences. Multilevel regression involves aggregating public opinion polls, then modeling survey responses as a function of both individual-level characteristics and geography. Then, in the poststratification stage, the estimates are weighted by the proportion of those fitting the individual and geographic characteristics in the locality. Even so, it is difficult to determine local-level policy preferences, especially given that much local policy does not fall on the left-right political spectrum. There may not, for example, be any particularly Democratic or Republican way of filling a pothole or collecting the garbage.

In a separate string of literature, scholars have found that the racial diversity of those who govern – mayors, councilmembers, and other officials in key positions – matters for the diversity of the bureaucracy. That is, in local governments with more minority officials, the bureaucracy also tends to be more diverse (Kerr and Mladenka 1994). Generally, reform institutions, especially those with district-based elections (as opposed to at-large elections), are more likely to elect minority candidates to office (Shah 2009). More minority councilmembers and mayors are also associated with greater spending on minority policies (Karnig and Welch 1980), yet other scholarship finds more mixed results (Hopkins and McCabe 2012). And ultimately, there is some evidence that increased descriptive representation in local government generates benefits for minority populations (Meier et al. 2000).

## Local Policies

Besides local governance, explored in the previous section, scholarship has also come to focus on the local policies themselves. The following briefly explores, first, the policy typologies used in the study of urban politics, then the distribution of policies, and finally the operationalization of policy outputs and outcomes.

Peterson (1981) defines three types of policies (developmental, redistributive, and allocational), which have been subsequently adopted in much of the urban politics literature. Developmental

policies tend to promote local economic growth. Examples include creation and maintenance of streets, highways, and other transportation infrastructures. Redistributive policies tend to favor relatively disadvantaged groups at the expense of the city's economic development. Such redistributive policies include, most obviously, welfare but also education, affordable housing, and health care. In contrast, allocational policies have little economic effect on the locality, and they often include such services as parks, trash removal, and police and fire departments. Much subsequent research has adopted this typology in examining the determinants of spending patterns.

Examination of service delivery of these various city policies – developmental, distributive, and allocational – tends to show that none of these policy types are distributed equitably across a city. A variety of studies (see DeHoog 1997 for a review) have examined libraries, parks, streets, and schools, all finding that services were not distributed equitably. In each case, the inequity in service delivery is attributed to one of three reasons. First, bureaucratic rules and decision-making were said to be responsible for the uneven service patterns. Second, local politicians and officials were thought to interfere with and control some city services, thus affecting service patterns. Finally, it was reasoned that there was discrimination in service provision based on class and/or race. That is, disadvantaged groups were less likely to receive services than other more advantaged groups. Oftentimes, the latter two explanations went hand in hand.

Most studies of local policies and politics have utilized total spending, per capita spending, spending broken out by category, or the ratio of spending to taxes. It should be noted that this operationalization of policy commodifies policy as being purely fiscal and thus neglects the question of if and how effective the policy is. In other words, local politics and policy scholarship tend to quantify policy as an output (amount spent), rather than an outcome (how well the policy performs at achieving its desired goal). Only a select few studies within political science (Ammons 2003) have examined how local policies affect outcomes. It should be noted that there is significant research on educational outcomes, but studies of other local policies generally lag behind. Moreover, studies of local policy outcomes tend to be undertaken by economists, rather than political scientists or public administrators. For the most part, there is significant work to be done on urban policy outcomes from a political science or public administration perspective.

## Conclusion

While urban politics and policy scholarship is a rich body of literature, it is also ripe for future research. Below, I provide three recommendations. First, and most generally, local politics can help assess those questions that go unexamined at the state or federal level due to lack of variation. There is incredible diversity among municipalities and local governments in terms of institutional arrangements, demographic characteristics, and community features. Moreover, local politics and policies have far fewer ideological and partisan cues when compared to the state and national level. As mentioned previously, there is not necessarily a conservative or liberal way of picking up garbage.

Second, much of the research thus far has focused on the largest city governments, and there is significant opportunity to expand analyses and test existing theories with smaller, less metropolitan units. Would these same theories, tested with large, urban areas, still be supported in more rural and less metropolitan areas? In addition to expanding units of analysis to less metropolitan areas, scholars and practitioners should also consider that local government is not just limited to the city government. Instead, local governments can also include county governments, school districts, and special purpose districts. Special purpose districts vary from state to state and locality to locality, covering a variety of purposes and services; these include cemetery districts, park and recreation districts, hospital districts, soil and water conservation districts, along with many others. These governmental units not only deserve attention because they are often

overlooked, but they can also help shed light on issues that are unable to be tested at the state or federal level due to lack of variation. For instance, some special purpose districts or school districts have moved from appointing officials to electing officials, and this change would allow scholars to assess a variety of questions: does responsiveness change, do outcomes improve, and does citizen perception improve when there are elected, rather than appointed officials?

Third, and as mentioned in the previous section, there is significant opportunity to assess how governance affects outcomes. Thus far, much of the literature has focused on spending, either total or per capita, without an examination of the efficacy of those expenditures. There needs to be more exploration and experimentation with how governance affects outcomes – the intended aim of the policy.

# Local Sales Taxes

Whitney B. Afonso
University of North Carolina at Chapel Hill, Chapel Hill, NC, USA

## Synonyms

Local taxes on consumption; Sales taxes for local governments; Subnational sales taxes

## Definition

Local sales taxes are taxes on consumption of goods that are instituted by local governments such as municipalities, counties, and special districts.

## Introduction

Local sales taxes are sales taxes that are adopted, often after a referendum vote, by local

governments. Thirty-eight states have local governments with local sales taxes in place. The laws that govern these local sales taxes vary tremendously state by state. In some states only counties are permitted to adopt local sales taxes; in others, only municipalities; and in some, counties, municipalities, and special districts. There are many possible and actual combinations of jurisdictions. Beyond those basic differences, there are also large differences in the state laws that regulate how these local sales taxes will function, what they will tax, and what rates are permissible.

Local sales taxes are now the second largest source of own source revenue for local governments in the United States, and their popularity and local government reliance on them are only growing. While they are nothing new, the first local sales tax was introduced in New York City in 1934 during the Great Depression. They did not become widespread until the 1970s, and even then only 25 states permitted them. While they have been a vital source of revenue for many local governments for many years, the literature surrounding local sales taxes has largely emerged in the last two decades, though there are notable exceptions. Today many aspects of local sales taxes have been studied including whether they are used to supplement or reduce property taxes, how volatile the revenue generated by local sales taxes is, the revenue-raising capacity of jurisdictions with regard to local sales taxes, and the factors that influence the adoption of local sales taxes.

## Legal Context

Before exploring the analysis of local sales taxes, it is important to understand basics about how the laws surrounding local sales taxes may impact studies, results, and outcomes. Recently Afonso (2017a) presented a framework on local sales tax laws in a context of jurisdictional eligibility and discretionary authority. Jurisdictional eligibility is defined as the set of laws and/or restrictions that dictate which local governments are permitted to adopt local sales taxes. In many cases this means the level(s) of local government, i.e., county, municipal, or special district. However, in some states it may also include constraints involving population, home rule status, and size of tourism industry. Discretionary authority is defined as the sets of laws and/or restrictions that bind the jurisdiction's ability and autonomy to shape and use local sales tax revenue. The two most common ways that discretionary authority is manifested are rate limits and revenue earmarking requirements. This research was followed by an updated discussion of local sales tax complexity and the impact it has on economic nexus (Afonso 2019) (Table 1).

## Areas of Research

The research on local sales taxes is a growing field of inquiry that spans many disciplines, research questions, and approaches. The majority of the research in this area is done via single-state analyses; this is likely due in part to the diverse and complicated nature of the laws governing local sales taxes. In addition to the majority of research being done at the state level, the majority of the research also examines county local sales taxes rather than municipal or some combination of jurisdictions. A third theme among the existing literature is that of those single-state analyses, the majority of them are conducted in the state of Georgia or Oklahoma. This last point is especially problematic given the differences in how local sales taxes are structured; although it is true for Georgia counties, it may not mean anything for West Virginia municipalities or special districts. Despite these limitations there is a great deal of valuable research and insights about local sales taxes that can be taken from this literature. This chapter will cover four of the more prominent and robust lines of literature and briefly discuss some of the other analyses of note.

First things first, what prompts some local governments to adopt local sales taxes almost immediately and others to never adopt? This is a topic that was first examined in the context of counties in Georgia in three separate analyses and examined from multiple perspectives including the effect that property taxes had on adoption, whether the effects of neighbors' local sales tax

Note: States with no jurisdictional eligibility and no discretionary authority, i.e., those without local sales taxes are not included. Those states are Connecticut, Delaware, Indiana, Kentucky, Maine, Maryland, Massachusetts, Michigan, New Hampshire, Oregon, and Rhode Island
Taken from Afonso (2017a)

adoption have an effect, and the ability to shift the local sales tax burden to nonresidents (Pajari 1984; Zhao 2005; Sjoquist et al. 2007). These analyses are followed up with additional state contexts and perspectives. For example, Luna et al. (2007) examine the final local sales tax adoption in Tennessee counties – this is novel because it is the first to recognize that many local governments will adopt more than one local sales tax. Another example is that of Burge and Rogers (2016) who examine the adoption of local sales taxes in Oklahoma from the perspective of leader-follower dynamics. A final example with this line of research is Afonso (2018) who examines Texas municipal local sales tax adoptions with a repeating events model and is the first to model multiple local sales tax adoptions. In general this line of research finds that being able to export burdens to nonresidents and the adoption of local sales taxes by neighbors and peers are important factors when understanding the adoption path of local governments.

A second important line of research within the local sales tax area is the relationship between local sales taxes and property taxes. This is not surprising since property taxes are the largest source of own source revenue for local governments and local sales taxes are the second largest. The first analysis to tackle this question utilized Georgia counties once again (Jung 2001). Similarly, there was a follow-up study also examining this relationship in Georgia counties (Zhao and Jung 2008). However the second, fourth, and fifth analyses used national samples (Sjoquist et al. 2005; Afonso 2014, 2015). The second used a national sample of large cities, and the fourth and fifth used a sample of counties from 35 states. The results are largely consistent with each other. When answering the question, do local governments use local sales tax revenue to increase total own source revenue or to offset and lower property tax revenue, the consensus is both. The analyses examining the national datasets find that there are two distinct types of local government behavior, and Afonso (2014, 2015) suggests that an important factor that can be used to differentiate these types is the adopted local sales tax rate.

A third line of research involves the volatility of revenue receipts once local governments become more dependent on local sales taxes. This literature is closely related to other literature of revenue portfolio diversity that does not

directly compare dependence on property taxes to dependence on local sales taxes. For the studies that have directly studied the relationship between greater dependence on local sales taxes as opposed to property taxes (Afonso 2013, 2017b; Hou and Seligman 2010), the evidence finds that revenue receipts become more volatile. An important implication of this finding is that local governments will need to address this uncertainty due to the requirement that they balance their budgets. A primary strategy to do this would be to increase the size of their fund balance (or rainy day fund).

The fourth and final line of research to be discussed here is on sales tax competition. This line of research examines issues of cross border shopping, rate setting, and spatial competition (Agrawal 2015; Burge and Rogers 2011; Wong 1996; Luna 2004). A large concern regarding local sales taxes is whether having a higher local sales tax rate in your jurisdiction will encourage consumers to do their shopping in other communities; this is often referred to as tax leakage. As a result there is also examination of whether neighboring jurisdictions' local sales tax rates will impact home local sales tax rates. There is the possibility of policy mimicking where you are more likely to adopt local sales taxes because neighbors and/or peers have done so or tax competition where you will choose to remain *just below* neighbor's rates. The evidence supports that spatial competition does affect both local sales tax rates and tax leakage.

## Conclusion

In many respects, local sales taxes are still in their toddlerhood. While, strictly speaking, they have existed since the 1930s, they did not become widely available until the 1970s, and their adoption and prevalence came subsequently. This is very unlike the property tax. Local sales taxes have grown in popularity, and many have speculated why. One possible reason is that it is not that people prefer local sales taxes to property taxes, but simply that property taxes are too restricted by tax and expenditure limitations and are essentially "tapped out." Another possible reason is that they are genuinely more popular and that citizens prefer local sales taxes to property taxes. There are numerous potential reasons this may be true; perhaps the largest three are that (1) sales tax burden may be shared by both residents and nonresidents (tourists, commuters, students) in a way that the property tax cannot be, (2) people do not realize their full local sales tax burden in the same way as the property tax since it is spread out throughout the year on many purchases, and (3) if residents would have a larger tax burden under a higher property tax rate, then they will prefer local sales taxes.

These reasons also shed some light on some of the concerns regarding sales taxes. First, since people often do not realize their full sales tax burden, they often underestimate it. This is an aspect of a broader concept referred to as fiscal illusion. Second, people want to minimize their tax burdens, and that is rational and expected. However, the sales tax (local or otherwise) is regressive. Regressive simply means that low-income people will pay a larger share of their total income than wealthy people will. It does not mean that the low-income people are paying more in actual dollars, just that it is a higher percentage of total income. Many states often try to make sales taxes less regressive by omitting food and prescription drugs from the tax base.

Another aspect of local sales taxes that has been largely unexplored but is critical in understanding both why they have spread and why they are popular among voters is that the revenue is often earmarked for specific purposes. This means that when citizens vote to adopt local sales taxes, the jurisdiction is not just claiming they are going to use the revenue generated for specific functions/programs/projects – they are legally required to. Earmarks are a common feature of local sales taxes, and many types of earmarks exist. Not surprisingly there are local sales taxes that may be earmarked for popular areas of expenditure like education and transportation, but there are also earmarks for property tax reduction, economic development, and in some states they can be earmarked for projects that the jurisdiction specifies (Afonso 2017a). When citizens know how the revenue is going to be used, and they support that

area of expenditure, they are more likely to support the tax.

Local sales taxes are interesting, complex, and a critical source of revenue for many states' local governments. While there is still a lot more research needed to understand the effect that they may have on government and citizens alike and how they may interact with the economy, other sources of income, and politics, there is a solid foundation of research today. As consumers, and in some case producers, of information, it is essential to understand local sales taxes and to always consider the institutional and legal framework that the local sales taxes are nestled within.

# Low Fertility in South Korea: Causes, Consequences, and Policy Responses

HyeonUk Bak
Institute of Governance and Policy Evaluation, Sungkyunkwan University, Seoul, Korea

## Synonyms

Aging society; Fertility change; Fertility decline; Low fertility; Population decline; Pro-natal policy

## Definition

Total fertility rate is defined as the total number of children born or would be born to a woman in her lifetime. Total fertility rate of about 2.1 births per woman is called the population replacement level. Low fertility refers to a total fertility rate below the replacement level. Lowest-low fertility refers to a total fertility rate at or below 1.3.

## Introduction

South Korea is facing a fertility rate crisis. Its rapidly dropping fertility rate is now one of the lowest in the world. In 1960, South Korea's total fertility rate (TFR) was 6.0, dropping to 4.53 in 1970. Since 1983, the TFR in South Korea has remained below the population replacement level (Lee 2009). In 2003, the TFR dropped to 1.19 and has remained below 1.3 ever since (Stephen 2012). As of 2017, South Korea's TFR hit a low of 1.05 and is expected to continue to fall, placing the country at risk for population instability and economic decline (Fig. 1).

## Causes of Low Fertility/Fertility Decline

### The Family Planning (FP) Program

In order to understand the causes of the fertility decline in South Korea, it is important to touch on the population policy, the family planning (FP) program. The Planned Parenthood Federation of Korea (PPFK, Taehan Kajok Kyehoek Hyeophoe) was established in April of 1961 as a part of the Korean government's 5-year economic plan (Stephen 2012). The Korean government regarded the rapid population growth as a serious barrier to economic development (Whang 1981). The FP program, as a population control policy, was introduced in 1962. The objectives of the FP program were to reduce the total fertility rate and the population growth rate (Lee 2010). In 1961, South Korea's population grew by 3% each year. The goal was for this rate to drop to 2% by 1971. In

**Low Fertility in South Korea: Causes, Consequences, and Policy Responses, Fig. 1** Number of births and total fertility rate in South Korea. (Source: The National Statistical Office 2018a)

order to achieve the objectives, PPFK not only used medical countermeasures, such as oral contraceptives, condoms, vasectomies, and intrauterine devices, but also conducted an anti-natal campaign (e.g., "If you give birth recklessly, you will inevitably become a beggar" in the 1960s and "Raise well no more than two children without distinction of sex" in the 1970s) (Mahmoudi 2017, p. 42; Whang 1981, p. 37). The Korean government offered economic incentives to families participating in the FP program to heighten the effectiveness of the anti-natal policy. Due to the FP program, the total fertility rate dropped from 6.0 in 1960 to 4.53 by 1970 and 2.1 (a replacement level) by 1983 (Lee 2009; Mahmoudi 2017; Stephen 2012). The fertility rate in South Korea has not returned to the replacement level since 1983, 21 years after the FP program was introduced. Researchers argue that the beginning of the rapid reduction in fertility rates in South Korea is attributable to the FP program (Eun 2007; Lee 2009; Mahmoudi 2017; Stephen 2012).

## Demographic Factors

The age at which a woman first gets married corresponds strongly to fertility rates. In South Korea, the general trend has been for women to marry later. The female's age at first marriage (FAFM) in South Korea rose from 24.8 years in 1990 to 30.0 years in 2015 (The National Statistical Office 2018b). The rise in the female's age at first marriage can be largely attributed to increased rates of university enrollment and labor force participation by women (Lee 2009). The number of women who enrolled in universities increased from 50% in 1995 to 72.7% in 2017 (Lee 2009; Stephen 2012; The National Statistical Office 2018b). The employment rate of women aged 25–29 and 30–34 increased significantly from 53.7% in 2000 to 69.6% in 2017 and from 47.3% in 2000 to 61.0% in 2017, respectively (The National Statistical Office 2018b). The prolonging of the female's age at first marriage plays a vital role in lowering the fertility rate because it curtails the childbearing span and adverse maternal and perinatal outcomes, such as birth defects, infertility, perinatal mortality, and preterm delivery, are higher for women who give birth at older ages (Lee 2009; UN 2014) (Fig. 2).

The fertility rate of married women (marital fertility rate or MFR) in South Korea strongly influences its overall fertility rate. This is because the majority of childbirths in South Korea occur in marital relationships. Most age groups in South Korea show a downward trend in MFR. The MFR declined in all of the following age groups from 1981 to 2005 as follows: (a) married women ages 20–24 dropped from 440 per thousand in 1981 to 202 in 2005; (b) married women ages 25–29 dropped from 279 per thousand in 1981 to 231 in 2005; and (c) married women ages 30–34 dropped from 121 per thousand in 1981 to 108 in 2005 (Byun et al. 2010; Lee 2009). The decrease in MFR has been linked to more couples choosing

Source: Korean Statistical Information Service (KOSIS) (2019)

to have fewer children and an increase in maternal age at first birth (Lee et al. 2015, 2016; Lee 2009).

The increase in the percentage of unmarried women in South Korea also contributes significantly to the country's low fertility rate. Marital fertility is a decisive factor in childbirth, as illustrated by the low proportion of births that occur in unmarried women (Lee et al. 2016). The majority of childbirths in South Korea occur in women ages 25–34. Table 1 shows a sharp increase in the percentage of unmarried women in this age group (25–34) over a span of 45 years. From 1970 to 2015, the percentage of unmarried women ages 25–29 and 30–34 increased from 9.7% to 77.3% and from 1.4% to 37.5%, respectively.

## Cultural Factors

A shift has also occurred in South Korean culture regarding the value and necessity of marriage. Multiple factors have contributed to this change, including increased economic development, urbanization, and individualism. Compared to their predecessors, the younger generation in South Korea has much greater flexibility in their life choices as a result of economic growth and increased opportunities for higher education. In the traditional society in South Korea, people considered marriage an important means of carrying on a family line, maintaining community order, and reproducing the next generation. However, the younger generation views marriage as a choice, not a necessity. Self-realization is preferable to a succession of the family line through marriage (Chang 1993). Researchers also argue that women are more inclined to avoid marriage as a result of a variety of socioeconomic pressures. Examples include concerns that marriage may (a) hinder a woman's career development and success, (b) increase household responsibilities for a working woman, (c) result in a higher economic burden especially if children are involved, and (d) decrease job security in women (Eun 2007; Korean Government 2011, 2016; Lee et al. 2006, 2015).

Another factor that influences low fertility in South Korea is the change in the value of children. Traditionally, South Korean people have considered children necessary because parents derived pleasure, pride, and love from having and rearing children. They depended on their children in retirement, and children played a role in providing family workforce and keeping the continuation of a family line. As individualism, the pursuit of their own happiness, and self-development has been prevalent among the current generation, people have taken actions that optimize their utility and well-being. Therefore, the subjectively perceived value of children has changed as the utility derived from children decreases, while the costs of childrearing and education increase. Previous studies have shown that the importance of having children tends to decrease among South Korean people due to constraints, such as the financial burden of childcare and lack of childbirth-/childcare-friendly environments (Lee et al. 2015, 2016). Researchers also argue that South Korean people's preference for a small number of children is linked to low fertility (Lee 2010; Lee et al. 2016).

Work-life imbalance decreases fertility level in South Korea. South Korea's fertility rate is also negatively affected by the rising number of women completing higher education and joining the workforce. However, because traditional values still place the burden of household duties and childcare primarily on the woman, women are more likely to abandon their careers or take time off because of marriage, pregnancy, childbirth, or

childcare needs. Furthermore, although women can reenter the labor market later, they suffer disadvantages in terms of promotions, salary increases, and job opportunities. Consequently, a growing number of women are choosing to delay childbirth as balancing work and housework/childcare becomes a challenge.

### Socioeconomic Factors

Economic factors have also played a significant role in contributing to the low fertility rate in South Korea. Because of increased unemployment rates and rising job insecurity, there has been a general trend among young people in South Korea to delay marriage and childbirth (Eun 2007; Lee 2009). Since the economic crisis of 1997, employment opportunities have diminished, with companies preferring to hire applicants with more work experience, additional skill sets, and foreign language skills. As a result, young people are spending more time and money (e.g., delaying graduation, going abroad for foreign language acquisition, completing internships, and acquiring additional certifications) competing for employment in a limited job market (Eun 2007). Despite such efforts, youth unemployment among people aged 15–29 years (see Fig. 3) has become a serious problem in South Korea. Researchers suggest that high unemployment among the young population, job insecurity (e.g., temporary positions), the sluggish economy, and low income are the primary reasons single men and women are choosing to delay marriage and childbirth (Lee 2010; Lee et al. 2006; Stephen 2012).

Researchers also argue that the rising rate of labor force participation among South Korean women has a negative correlation with the country's fertility rate (Lee et al. 2016). From 2000 to 2017, the employment rate of women aged 25–29 increased dramatically from 53.7% to 69.6%. Similarly, the employment rate of women aged 30–34 increased from 47.3% in 2000 to 61.0% in 2017 (Eun 2007; The National Statistical Office 2018b). The rapidly rising labor force participation rate among women is attributed to women's educational attainment, increased gender equality, women's growing advancement in society, and improved women's status (Lee et al. 2016).

The lack of childcare facilities and services in South Korea is another major contributor to its low fertility rate. Many couples are choosing to delay or avoid childbirth altogether because of this lack of support (Stephen 2012). Although the number of childcare facilities has increased over the last 10 years, it is still not enough to accommodate the demand for services. In addition, public childcare facilities are preferred over private facilities due to their lower cost and higher safety standards. However, public facilities account for only 7.8% of all childcare facilities in South Korea (Ministry of Health and Welfare 2017). There have also been some concerns regarding the quality and safety of childcare facilities, due to reports of abuse, poor meal service,

**Low Fertility in South Korea: Causes, Consequences, and Policy Responses, Fig. 3** Youth unemployment rate among people aged 15–29 years. (Source: Korean Statistical Information Service (KOSIS) (2019))

and unqualified caretakers. According to the 2015 National Survey on Fertility and Family Health and Welfare, a considerable number of parents reported not being satisfied with the quality of available childcare services and facilities (Lee et al. 2015).

The additional financial burden of raising a family contributes further to low fertility rates. Married women aged 20–39, with one child or less, have reported abandoning additional pregnancy plans due to high costs of housing, living, and raising children (Korean Government 2011, 2016). Especially, education costs for children in South Korea are a considerable burden for most parents. Korean society, with its Confucian roots, places a strong emphasis on education as the primary source of individual advancement, material success, and social status. The average cost of childhood education accounts for 14.6% of the total household expenditure. In addition, the monthly total cost of childrearing expenses averaged $1,200 per family in 2015, accounting for 56% of the total household expenditure. Specifically, the monthly total cost of childbearing expenses averaged $570 for families with one child, $1,130 for families with two children, and $1,345 for families with three children. In addition, it is estimated that the total cost of raising a child from birth up to college entry is more than $200,000 (Lee et al. 2015; Stephen 2012). Researchers argue that the rise in childcare and education costs, regardless of income level, is closely related to the low fertility rate in South Korea (Lee 2009; Stephen 2012).

## Consequences of Low Fertility

If low fertility continues in the future, several problems will occur. It is estimated that the total population will decrease, after peaking at 52.1 million in 2030, to 48.1 million in 2050 (Korean government 2016). It is also expected that the school-aged population will decrease from 9.9 million in 2010 to 4.6 million in 2050 (Ministry of Health and Welfare 2011). A decrease in the school-aged population will bring about various changes in education. The total enrollment quota is expected to exceed high school graduates since 2020, and the number of unfilled student vacancies at universities and colleges will be 218,000 in 2030 (Korean government 2016; Ministry of Health and Welfare 2011). As the number of unfilled student vacancies at universities and colleges increases, revenues of most universities and colleges will decline, and they have less budget for faculty, facilities, and curriculum. This could lead to decreasing research faculties and increasing adjunct faculties. By hiring more adjunct faculties and reducing investment, the quality of higher education will worsen. In addition, less competitive universities and colleges will be merged or closed.

Rapid demographical change into the aging society is one of the most serious consequences of low fertility in South Korea. Aging refers to a demographic phenomenon that is experiencing a rise in the proportion and the number of elderly people in a population due to declining fertility and increasing life expectancy. A society's aging rate is determined by the proportion of people aged 65 years or older in that population. A population meets criteria for an aging society when the aging rate reaches 7% or higher; aging rates of 14% or higher and 21% or higher define an aged society and a super-aged society, respectively. In 1960, people aged 65 years or older in South Korea equaled only 730,000. As that age group increased in size, South Korea became a so-called aging society in 2000 (3.39 million people with a 7.2% aging rate). Researchers expect that South Korea will cross the threshold into an aged society, with a 15.7% aging rate, by 2020 and into a super-aged society, with a 24.3% aging rate, by 2030 (Korean Government 2016). The pace of change from an aged society to a super-aged society for South Korea is faster than that of most other countries. In comparison to South Korea, which will become a super-aged society in another 10 years, other countries are aging at a much slower rate. France will require another 41 years, Germany another 40 years, Italy 19 years, and the United States 15 years before becoming super-aged societies (Eun 2007). It is estimated that South Korea will become one of the oldest countries in the world by 2060, with an

aging rate exceeding 40% (Korean Statistical Information Service 2019; Stephen 2012).

Low fertility, along with the increase in the aging population, has serious knock-on effects on individuals, families, and society in general. It is expected that significant labor shortage problems will occur in the near future. The working age population will decrease to 20.62 million by 2065 after peaking at 37.6 million in 2016. The working age population accounted for 73.4% of the total population in 2015, but the ratio will decrease to 47.9% by 2065 (The National Statistical Office 2016). In addition, the ratio of the working age population aged 15–24 and 25–49 among the total working population will decrease from 18.0% (6.73 million) in 2015 to 14.8% (3.05 million) by 2065 and from 52.8% (19.79 million) in 2015 to 49.3% (10.15 million) by 2015, respectively. Experts predict that the labor shortage resulting from a declining working-age population and low fertility rate will reach 1.52 million by 2020 (Korean Government 2011).

Another issue facing South Korea is its rapidly aging labor force, as fewer new workers are entering the labor market. It is estimated that the average working population age will increase from 40.3 in 2015 to 42.9 by 2030. As South Korea's labor force ages, more skilled workers enter retirement, and the working population shrinks, labor productivity is expected to decrease and have dire consequences on economic growth (Korean Government 2016). Experts predict that the growth rate of the South Korean economy could fall below 1% in the 2050s.

Under the assumption of a persistently low fertility rate, the decrease in South Korea's working population (i.e., those with high purchasing powers) and an increase in its elderly population (i.e., those with low purchasing powers) will have negative consequences on economic consumption and investment. Higher taxes paid by the working population and businesses may also lead to decreased consumption and investment, hampering economic growth in the long run. Declining domestic markets combined with labor shortage concerns and decreasing productivity raise the potential for a steady decline in economic growth (Korean Government 2011, 2016; Stephen 2012).

A decrease in fertility rates, combined with the sharp increase in the aging population, will increase the public pension cost. As the working population shrinks and more individuals enter retirement, government revenue also drops. In addition, the number of pension recipients will continue to increase, while the number of pension holders has decreased after peaking at 18.9 million in 2014 (Korean Government 2011; Stephen 2012). It is estimated that the National Pension System will be in the red by 2044 and consequently exhausted by 2060 (Korean Government 2016; Ministry of Health and Welfare 2011).

The rapid reduction in fertility rates along with the low economic growth will deteriorate the financial soundness of the Korean government. Government revenue is expected to drop, while public expenditure covering benefits for the elderly (e.g., healthcare and pensions) is expected to increase rapidly. In 2013, the proportion of GDP spent on social welfare and safety net programs was only 9.8%. However, as South Korea's aging population continues to grow and fertility rates remain low, this number is expected to exceed 25% of GDP by 2050 (Korean Government 2011, 2016; Stephen 2012). In addition, South Korea's government debt accounted for a moderate 35.9% of the country's gross domestic product (GDP) in 2014. Researchers prospect that the debt-to-GDP ratio will increase to 64.2% due to the increasing public spending and decreasing revenue due to low fertility and aging population (Korean Government 2016).

A growing elderly population also places significant economic and social burdens upon younger generations, who are expected to support and care for their elders. Not only is the population aging, but life expectancy is also longer. The current generation carries the extra financial burden of caring for their parents and grandparents, in addition to their children. As government expenditures increase to cover the cost of healthcare, pensions, and welfare programs for the increasing number of elderly individuals, the higher the tax burden on younger generations. Generational conflicts often add to the social burden of caring for the elderly and can be exacerbated by a high youth

unemployment rate, job insecurity, and rising housing costs.

## Policy Responses to Low Fertility

As low fertility and an aging population are perceived as serious problems that pose a threat to sustainable national development among the people and policymakers, "Basic Law on Fertility and Aging Society" was enacted in May 2005, and the "Low Fertility, Aging Society Committee" was established in September 2005 to address low fertility and aging population challenges at the national level (Ministry of Health and Welfare 2011, p. 32). The Korean government has implemented the Basic Plan every 5 years, in cooperation with local governments, the related central administrative agencies, and civilian experts, to respond to low fertility and aging population since 2006 (Korean Government 2011).

### The First Basic Plan for Low Fertility and Aged Society (2006–2010)

In 2006, the Korean government announced the implementation of a new policy, called "The First Basic Plan for Low Fertility and Aged Society" (Sareromaji Plan 2010), to address crucial problems in terms of low fertility and aging population. The First Basic Plan was divided into three areas: (1) creating a childbirth- and childcare-friendly environment, (2) laying the groundwork for improving living standards in an aging society, and (3) securing the growth engine for the future (Korean Government 2006, 2011, 2016; Ministry of Health and Welfare 2011).

To foster childbirth- and childcare-friendly environments, the Korean government established a variety of programs and incentive systems: (a) financial support for childcare and preschool education costs, (b) expanding the infrastructure of childcare facilities, (c) revising the tax system to be more favorable to families with multiple children, (d) giving working couples with children priority status at childcare facilities, (e) expanding after-school programs to reduce childcare costs, (f) increasing pay before and after maternity leave, (g) broadening eligibility for maternity leave and paternity leave, (h) granting the right to request flexible working hours, and (i) helping women return to work after childbirth (Eun 2007; Korean Government 2006, 2011; Lee 2009; Ministry of Health and Welfare 2011).

Part 2 of the First Basic Plan was aimed at improving living standards in an aging society, with specific goals to establish an elderly-friendly infrastructure, improve the quality of life of seniors, and reduce the burden of caring for the elderly. The policies and programs of this area included (a) improving the public pension system to increase income stability in the elderly, (b) invigorating public and private pension systems, (c) improving medical care and senior health management for a healthy life of the elderly people, (d) encouraging elderly participation in various cultural and leisure activities, (e) increasing qualified nursing care for the elderly, (f) providing senior-friendly transportation, (g) creating jobs for the elderly, and (h) providing affordable housing options for the elderly (Korean Government 2006, 2011; Ministry of Health and Welfare 2011).

The third area of the Plan was aimed at securing resources to support future social and economic growth in an aging society with a low fertility rate. The policies and programs of this area included (a) expanding opportunities to increase the employment of women and the elderly, (b) embracing expatriate and foreign labor forces in preparation for the shrinking working population, (c) strengthening the link between education and the labor market, (d) increasing job skills development and lifelong education systems, (e) building of new reverse mortgage payment plan, and (f) nurturing the growth and demand for senior-friendly industries (Korean Government 2006, 2011; Ministry of Health and Welfare 2011).

### Outcomes and Criticism to the First Plan

In order to respond to the low fertility and aging society, the First Plan was implemented. There are several policy implications of the First Plan. First, it was possible to establish the government-led response system to low fertility and aging population issues. Second, various laws and policies were enacted and revised to address both low fertility and the increase in the elderly population. Lastly,

the First Plan contributed to building public consensus about the seriousness of low fertility and aging population problems (Korean Government 2011, 2016; Ministry of Health and Welfare 2011).

However, there were several limitations of the First Plan. First, a sizable majority of people were not aware of government policies and programs in terms of low fertility and aging population. Second, the First Plan focused on particular areas (e.g., childcare support for parents with children and basic pension for elderly people) instead of implementing comprehensive policies that benefit a diverse population. Lastly, the effectiveness of the First Plan was limited because of the lack of the participation of the private sector (Korean Government 2011, 2016; Ministry of Health and Welfare 2011).

### The Second Basic Plan for Low Fertility and Aged Society (2011–2015)

The Korean government introduced The Second Basic Plan for Low Fertility and Aged Society to address the limitations of the First Basic Plan. The vision of the Second Basic Plan was to "become an energetic advanced country by successfully responding to aging society and low fertility" (Ministry of Health and Welfare 2011, p. 37). The Second Plan called for enhancement of policies in the same three areas: (a) creating a childbirth- and childcare-friendly environment, (b) laying the groundwork for improving quality of life in the elderly, and (c) securing and enhancing the foundation for future growth (Ministry of Health and Welfare 2011, p. 37). Two new goals of the Second Plan included (a) restoring the fertility rate gradually and establishing a response system to the aging society and (b) raising the fertility rate to the average OECD level and addressing issues of aging more effectively (Korean Government 2011).

The Second Plan further addressed the creation of childbirth- and childcare-friendly environments by focusing on policies, such as improving work-family balance; decreasing the burdens of marriage, childbirth, and childcare; and increasing sound environments for the care of children and adolescents (Korean Government 2011; Ministry of Health and Welfare 2011). Policy tasks of the second area, improving quality of life in an aging society, included developing a response system for aging baby boomers, establishing a stable and energetic postretirement system, and creating an elderly-friendly environment (Korean Government 2011; Ministry of Health and Welfare 2011). Policies of the Second Plan regarding the third key area, securing the growth engine and improving policies, focused on facilitating untapped human resources and improving their competitiveness, improving socioeconomic policies addressing an aging population, and promoting senior-friendly industries (Korean Government 2011; Ministry of Health and Welfare 2011).

### Outcomes and Criticism to the Second Plan

In order to achieve the vision and goals of the Second Plan, the Korean government set up 231 subprojects in these four key areas between 2011 and 2015, including (a) 95 projects supporting childbirth- and childcare-friendly environments, (b) 78 projects addressing quality of life in the elderly, and (c) 58 projects aimed at securing the growth engine and enhancing policies area by area. In addition, approximately 109.9 trillion won ($98.7 billion) was allocated for the budget of the Second Plan, which was three times higher than that of the First Plan (Korean Government 2016). Although the Second Plan allocated a huge budget and manpower and implemented various policies and programs to raise the fertility rate and address problems regarding the aging population, the total fertility rate had been below 1.3, and the speed of aging had not changed over 5 years (2011–2015) of the Second Plan (Korean Government 2016; The National Statistical Office 2016).

### The Third Basic Plan for Low Fertility and Aged Society (2016–2020)

The Third Basic Plan, called Bridge Plan 2020, adopted a new paradigm to seek solutions for an aging society with a low fertility rate. Despite spending 152.1 trillion won ($135.6 billion) over 10 years (2006–2015) to address this problem, the Korean government has been largely unsuccessful in resolving low fertility and aging population issues. South Korea continues to have one of the

lowest fertility rates in the world. In response to the policy failures of the First and Second Plans, which turned out to be too limited and short-sighted, the Third Basic Plan offers a more comprehensive and structured approach, with policies aimed at addressing population concerns for at least one generation (20–30 years). These include policies created to solve the fundamental social and structural problems of low fertility and aging, especially in the areas of employment, education, and housing. The budget for the Third Plan is set at 197.5 trillion won ($177.4 billion) between 2016 and 2020 (34.5 trillion won ($30.9 billion) in 2016, 37.3 trillion won ($33.5 billion) in 2017, 38.4 trillion won ($34.5 billion) in 2018, 42.5 trillion won ($38.1 billion) in 2019, and 44.5 trillion won ($39.9 billion) in 2020 (Korean Government 2016).

The vision of the Third Plan is to build a sustainable society that fosters happy and productive lives in every generation, from the very young to the very old. Policies of the Third Plan are aimed at successfully addressing delayed marriage, abandoned pregnancy plans, unsatisfactory childcare and education systems, and the imbalance between work and family life. Examples of specific policy points include (a) providing diverse youth employment opportunities, (b) offering housing loans with low interest rates, (c) creating a marriage-/childbirth-friendly environment, (d) expanding treatment options and support for infertile couples, (e) creating favorable conditions for childrearing, (f) increasing financial support for childcare costs, (g) educational reform to reduce private education expenses, and (h) creating a work-life balance atmosphere (Korean Government 2016).

## Conclusion

South Korea has experienced the challenge of low fertility since 1983, when its total fertility rate first dropped below replacement fertility levels. Although the Korean government attempts to stem and reverse this trend, South Korea continues to have one of the lowest fertility rates in the world. Demographic, economic, and sociocultural factors have contributed to this problem. More women are marrying later in life or choosing not to marry at all. Fertility rates among married women are also dropping as more couples choose not to have children and as the rate of women joining the workforce continues to rise. Additional economic factors that discourage childbirth include labor market insecurity, increased unemployment rates, and increased costs of childrearing, including education expenses. Sociocultural factors that further contribute to the low fertility rate include a lack of work-life balance, shifting value placements on marriage and children, and insufficient access to quality childcare facilities and services.

To address the challenge of an aging population with a low fertility rate, the Korean government developed the Basic Plan for Low Fertility and Aged Society (also called Saeromaji Plan). The First Plan (2006–2010) focused on creating childbirth- and childcare-friendly environments, laying the groundwork for improving living standards for the elderly, securing the growth engine in an aging society with low fertility, and increasing social awareness of the problem to create solutions. During the First Plan, 42.2 trillion won ($37.9 billion) was spent, and 237 projects were implemented. The Second Plan expanded on the three key areas of the First Plan, with an additional 109.9 trillion won ($98.7 billion) spent between 2011 and 2015. The Third Plan, called Bridge Plan 2020, adopted a new paradigm with a more comprehensive, structural, and macro approach. New policies have been implemented, emphasizing youth employment opportunities, social responsibility for pregnancy and childbirth, expansion of childcare services, educational reform, and improved work-family balance. The goal of the most recent Plan is to boost the total fertility rate up to 1.5 by 2020.

Although the Korean government has established a variety of policies and programs and allocated a generous budget to address the country's low fertility rate, the effectiveness of the pro-natal policies has only been marginal. Factors contributing to the fertility rate crisis are diverse and complex. A more comprehensive and far-reaching approach by the government is needed to reverse the problem. Successful policies should identify the fundamental causes of low

fertility, fully apprehend target needs, collaborate with the private sector to create solutions, and approach problems with a long-term view.

# Low-Income Housing Policy in the United States

Yanmei Li
School of Urban and Regional Planning, Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Affordable housing; Public housing; Social housing

## Definition

Low-income housing policies are those that focus on providing decent housing or housing assistance, regardless of renter- or owner-occupied housing, to low-income individuals or families who are not able to afford market-rate housing. Low-income housing policies vary in different countries and remain as one of the most challenging public policies.

## Introduction

Modern housing policies in the United States date back to the birth of contemporary urban planning,

roughly around the end of the nineteenth century and the beginning of the twentieth century. There were earlier attempts to reform the living conditions of the poor; however, the 1901 New York State Tenement House Act formally and officially improved the design of tenement buildings to make them more sanitary and environmentally healthier (e.g., by adding natural sun light to apartments and improving the sewage systems). In the late 1920s and early 1930s, during the New Deal Era, the Great Depression threw millions into financial trouble, and many faced the threat of losing their homes to mortgage foreclosures. The Housing Act of 1934 authorized the establishment of the FHA (Federal Housing Administration) to help pull homeowners out of the debt crisis. FHA guaranteed mortgages established strict underwriting standards in certain urban areas, which encouraged the practice of mortgage redlining where many low-income minority neighborhoods lost their credit access to secure a mortgage. Redlining deepened the racial and class segregation in the American residential landscape. Pockets of slums were deprived of reinvestment opportunities and experienced deteriorating conditions.

The 1949 Housing Act initiated an urban renewal movement, in the hopes of removing slums and ghettos to restore urban beauty as portrayed by many early urban planners, architects, and urban designers. While intentioned, the contradicting policies of providing public housing in the midst of urban renewal created slums instead of eradicating them (von Hoffman 2000). The 1954 Housing Act further defined slum prevention policies, in the hopes of curbing the formation of new slums, urban squatters, and ghettos. The urban renewal movement displaced many low-income minority enclaves yet did not solve the fundamental problems of urban poverty and its concentration.

During President Kennedy's and later President Johnson's term, the necessity to assist those in need for decent and sanitary housing was urgent. The "Great Society" program during President Johnson's administration was created to tackle the urban ills and problems. In 1965 the Department of Housing and Urban Development (HUD) was created to provide financial and technical assistance to individuals and communities in housing and community development. The creation of HUD signaled the inception of contemporary US low-income housing policies. Since the mid-1960s, various programs have been created, expired, or evolved (Schwartz 2015). Various legislations have enabled many housing programs for low- to moderate-income households to be successfully implemented. Some notable legislation is among the following: the 1968 Fair Housing Act, the 1975 Home Mortgage Disclosure Act (HMDA), and the 1977 Community Reinvestment Act (CRA). The Fair Housing Act makes housing discrimination illegal; HMDA does not allow for mortgage discrimination; and the CRA allows greater credit access in lower-income minority neighborhoods. All these legislations laid a solid foundation for the evolution of low-income housing policies in contemporary America. Financial assistance and tax incentives for providing low-income and affordable housing remain the policy priorities of the country.

## Supply-Side Policy

Supply-side policy was the earliest type of housing policies established and implemented in the United States. As the name indicates, supply-side policies emphasize using policies and programs to increase the supply of low-income housing stock. Some of the most notable supply-side housing policies are the project-based Section 8 rental assistance program, Section 8 housing rehabilitation program, mortgage or mortgage interest assistance programs (e.g., Section 236, Section 212(d)(3), and Section 515), public housing programs, and most recently the Low-Income Housing Tax Credit (LIHTC) program. Due to various issues, such as expiration of the contracts and the concentration of poverty, housing affordability was challenged, and the effectiveness of moving low-income people to higher-opportunity areas became questionable. Many of the supply-side programs expired and were not renewed. For example, except for the project-based Section 8 rental assistance program, all other Section 8 programs were reformed or eliminated. Most of the

mortgage or mortgage interest assistance programs, except Section 515, were also eliminated. Section 515 provides direct housing mortgage assistance to rural multi-family rental housing owners. The scope of these programs providing low-income housing stock is often limited, making them costly without yielding a large quantity of housing units.

In 1974, the creation of Community Development Block Grant (CDBG) replaced many of the supply-side housing assistance programs and gave local communities greater flexibility in managing the funds. However, CDBG provides much broader assistance beyond housing. This program is structured to be either supply-side assistance or demand-side assistance. Communities can use the funds for infrastructure or housing or a combination of both. The grant provides down payment assistance, home repair assistance, HVAC (heating, ventilation, and air conditioning) assistance, and housing assistance to people with special needs (such as the homeless, people with HIV/AIDS, people with disabilities, etc.). Another similar block grant program, the HOME Investment Partnership Program, focuses mostly on housing assistance. HOME is the largest federal block grant program exclusively designated to provide affordable housing for low-income individuals or households.

Public housing programs were another major set of supply-side programs in the United States. Public housing provides subsidized or free housing to individuals or families with very low or extremely low income (usually below 60% of the Area Median Income (AMI)). Public Housing Authorities (PHA) throughout the country provide management and oversight of the public housing stock. The challenges facing public housing in the United States are multifold. The first issue concerns poor management. At one time, the management was so chaotic that the Chicago Housing Authority was taken over by Congress. Gangs sprung up in the "projects," and high crime paralyzed social life and trust. Housing quality was in horrendous conditions and many of the units became uninhabitable. Another issue regarding public housing is concentrated poverty in public housing towers in large cities. The third issue concerns the lack of maintenance for older public housing stock. Some of the oldest housing projects were almost a century old, but lack of funding made it a daunting task to rehabilitate or repair those dilapidated housing units. In order to tackle all these issues, a new program, HOPE VI, was established in the early 1980s. HOPE VI no longer built concentrated public housing in a few limited places and reformed housing management. Many cities tore down old public housing stock; however, not every unit was later replaced. The reform in public housing, therefore, drastically reduced the public housing stock, leaving many homeless. The demolition and new construction of public housing displaced many former public housing residents, and only a small percentage returned to public housing after the new construction. During the Obama administration, the Choice Neighborhoods program, which focuses on housing, people, and neighborhoods and replaces or transforms distressed public or HUD-assisted housing to well-constructed and well-managed housing, requires a one unit to one unit replacement; however, the implementation of the program has proven difficult. Nowadays, the reform of the public housing programs remains a challenging issue.

The Tax Reform Act of 1986, which aims to simplify tax code and to reform tax incentives, established a landmark program – the Low-Income Housing Tax Credit (LIHTC) program. Since the inception of the program, LIHTC has created over two million low-income housing units. Now LIHTC is the largest program to help provide low-income housing units in the United States. The tax credit is allocated by state housing agencies, and usually at least 10% of the credit is required to be awarded to nonprofit organizations. The tax credit is allocated based on a formula, where the percentage of low-income units and whether the project is located in certain Qualified Census Tracts (QCT) (lower-income areas) or difficult to develop areas (high housing cost areas) play important roles in determining the amount of tax credit the developers may receive. The housing units were required to be affordable for at least 15 years, and the contracts may be renewed afterward. However, one issue is that once the affordable window lapses due to nonrenewal, loss of affordable housing units will become inevitable.

LIHTC provides a large amount of equity to the developers in building low-income housing units. The developers then sell the tax credits to the investors and use the funds in construction. During the boom years of the housing market, the tax credit was in strong demand. Many use it as tax shelters, and therefore the tax credit was oftentimes sold at a premium. However, during the recent housing downturn, the demand for the credit was drastically affected, and these tax credits were often sold at a deep discount. To date LIHTC is still very popular among developers of affordable housing. However, issues have arisen in the program. For example, fraud, especially the inflation of development costs of a project and the laundering of profit using shell companies, has been detected in a few metropolitan areas, such as in Florida's Miami-Dade County (PBS and NPR 2017). Another intrinsic issue of the program is the location of the projects. Many LIHTC projects are located in low-income minority distressed areas, due to incentives to build in Qualified Census Tracts, and community opposition. NIMBYism (Not in My Back Yard) has greatly hindered the goal of locating both the project-based and tenant-based assistance programs in higher-opportunity areas. Regardless of these self-limiting issues, LIHTC is still the most important program providing low-income and affordable housing in the United States. Some other supply-side policies were authorized and passed by Congress in response to the most recent foreclosure crisis. The Neighborhood Stabilization Program (NSP), which was authorized by the 2009 American Recovery and Reinvestment Act, was one of the most notable programs providing funding in acquisition, demolition, and rehabilitation of foreclosed housing units. Some of the NSP activities also include new construction of affordable housing units. Many nonprofit housing organizations, such as Community Land Trust (CLT), were able to use the funds to acquire affordable housing units and provide them to low- to moderate-income individuals or families with income below 120% AMI. With a large quantity of foreclosures during the "Great Recession," the scope of NSP in reversing the impact of foreclosed or vacant homes on neighborhoods is often limited. However, NSP has helped to alleviate some of the fiscal and financial burdens of local communities in disposing foreclosed or vacant homes.

## Demand-Side Policy

The largest and most important demand-side housing assistance program is the Section 8 Housing Choice Voucher program. This program replaced some of the former project-based Section 8 housing assistance programs. The purpose of the program is to improve flexibility and to deconcentrate poverty caused by the concentration of Section 8 projects in low-income distressed neighborhoods. The Section 8 Voucher program is often awarded using a lottery system to eligible applicants. The voucher program is administered by local housing authorities, which can opt to sign intergovernmental agreements to allow voucher holders to move between different jurisdictions. The program pays the difference between what a voucher holder can afford (usually not more than 30% of their income and may cover utility costs) and the asking rent. However, the asking rent must be within the limits of local Fair Market Rent (FMR) as determined by HUD. Fair Market Rent is usually determined based on the number of bedrooms. The asking rent is then compared to the FMR and the household size of the voucher holder. If the tenant (voucher holder) has to pay all the utilities, the asking rent may be requested to be lower by the Housing Authority.

Different from the project-based Section 8 housing assistance which is place specific, the Section 8 Housing Choice Voucher program enables the voucher holders to choose wherever they would like to live so long as the future landlords accept the vouchers. Unfortunately, many landlords hesitate to rent to the voucher holders due to fear of crime and vandalism of properties. However, most voucher holders are great tenants due to their fear of losing the vouchers. The chance of receiving a voucher is usually rather low with long waiting lists. Some voucher holders are not able to find a place which accepts vouchers, during the required time frame. They then lose the vouchers. The consequence of losing

the vouchers is usually devastating, particularly for single-parent families with multiple children.

In order to encourage finding housing in higher-opportunity areas, HUD initiated another program, called Moving to Opportunity, to provide counseling and other assistance in helping the voucher holders move to areas with more opportunities, such as better schools, more employment opportunities, and more amenities such as transportation, recreation, and grocery stores. However, research has indicated that few voucher holders have moved to higher-opportunity areas; for those who have, the opportunities are better, but still not high. Families with children and large households tend to move to higher-opportunity areas more than those with smaller households or senior households (Walter et al. 2015).

The Section 8 Voucher program awards more than two million vouchers currently and remains the largest demand-side low-income housing assistance program. Some other demand-side programs, such as housing assistance provided by CDBG and HOME, usually benefit a smaller number of individuals and families. These programs offer a range of housing assistance programs, such as homebuyer counseling, down payment assistance, home repair assistance, home HVAC assistance, mortgage reduction and forgiveness assistance, and first-time homebuyer assistance. Most of those programs target low- to moderate-income individuals and families. Some of the programs, such as the expired first-time homebuyer tax credit program, award those buying a home for the first time in 2008, 2009, and 2010. The income limits to qualify for the credit depends on in which year one purchased the home. The highest first-time homebuyer tax credit was $8000 or 10% of the home purchase price (whichever is smaller) and did not require repayment if the homebuyer live in the home as a primary residence for at least 3 years. The specific requirements differed in the years 2008, 2009, and 2010, and existing homeowners could also qualify for a smaller tax credit under certain terms and conditions. Many of the temporary housing assistance programs established during the American Recovery and Reinvestment Act of 2009 have phased out after the "Great Recession." However, they did play important roles in promoting recovery from the recession. Permanent housing assistance programs under CDBG, HOME Investment Partnership program, and others are still administered and implemented by state housing agencies or departments of development. The beneficiary of those programs is low- to moderate-income people, especially those in Appalachian areas, and those with special needs.

## Evaluation and Impact of the Low-Income Housing Policy

The positive impact of low-income housing policies and programs is that they provide low-income housing stock and help low-income individuals or households find decent housing to live in. The nature of the low profit of low-income housing makes it a public good. Therefore, the government has to assume its responsibilities to provide housing assistance. As mentioned earlier, financial assistance and tax incentives are the two major approaches in providing housing assistance. Over the years, all these programs have helped millions of low-income individuals and families to live in decent housing units. However, challenges remain. Long waiting lists for the Section 8 Voucher program, community opposition to low-income and affordable housing, loss of housing affordability once affordability requirements for units lapse or expire, loss of public housing stock, concentration of low-income housing in certain areas, and the rise of rents and housing prices in many metropolitan areas are some of the most prominent challenges facing the provision of low-income housing in the United States.

Increasing housing costs have made many households (nearly half of all households) cost burdened (Joint Center for Housing Studies of Harvard University 2017). These households pay more than 30% of their income in housing, and many low-income households, particularly renters, are severely burdened. For families with very limited disposable income, increased housing costs means a reduced budget for other necessities. Food, clothing, transportation, and medical expenses are often compromised due to an increased housing cost burden. Furthermore, the

private insurance system has driven up medical costs, and many are not able to afford medical or preventive care without coverage of health insurance. Losing income due to job losses or disability may drive these households into homelessness. Currently more than half a million people experience homeless on any given night in the United States, and there are more than 1.5 million homeless people using emergency shelter and food assistance services. Local shelters and food banks often are not sufficient to provide shelter and food to homeless population.

Another major issue is that financial- and tax incentive-based assistance has its limitations. During economic downturn and budget austerity, funding reduction may severely hinder the provision of low-income housing units and therefore not sufficient to offer housing assistance to families in dire need. Occasional fraud and abuse add another layer of uncertainty for many of the housing assistance programs.

Another issue may lie in the fragmentation of a housing policy at different administrative levels. The federal government usually provides financial assistance, which is administered by state and local governments. However, the lack of police power and legislative power of HUD makes it a mere funding administrator for offering financial and technical assistance to individuals and communities. Except for overall planning and zoning requirements, state governments usually do not intervene with local planning and zoning decisions. Therefore, except for the notable national programs in providing low-income housing units and housing assistance, state and local governments usually engage in very limited activities in providing low-income and affordable housing. Many local communities are reluctant to provide any affordable housing due to the fear of decreasing property values and school quality associated with the influx of lower-income residents. Therefore, creative approaches need to be taken to help provide low-income housing in areas with the strongest needs. For example, inclusionary zoning, where new developments are required to provide a certain percentage of affordable housing, has been practiced in many local municipalities. Allowing accessory dwelling units and micro homes are some other options that local communities can use to tackle the challenge of providing affordable housing.

# Lying

Seref G. Onder
University of Cincinnati, Cincinnati, OH, USA

## Synonyms

Administrative ethics; Administrative morality

## Introduction

Is it ever acceptable for a public official to lie or engage in deception? Is there a morally significant difference between lying and other behavior like misleading, deception, or evasion? These are some of the critical questions that scholars of ethics trying to answer for ages.

Lying in public sector is a serious problem for a society. Different cultures have different stories, songs, memes, and sayings which express how evil this behavior and how it can be harmful not only for individuals but also for the community. On the other hand, lying is one of the most common behaviors that we encounter almost every day in our private and public life. Lying in public sector has been one of the hottest topics discussed in political, legal, and moral philosophy. Reactions to public officials who tell lies or try to deceive people have varied from giving full support to disapproving the behavior as a whole. There is also another approach agreeing that there might be a room of tolerance for public officials to "not telling the truth" in some critical situations in order to maintain public good. In this essay, first the definition of lying will be discussed. Then, the morality of this behavior will be examined while sharing different approaches that support, reject, and conditionally tolerate the behavior of lying and misleading truth.

## Lying

Cohen (2008) notes that "lying is as old as speech" (p. 189). It is in the creation of the human and even animals, like birds, use deception as a tactic to deal with their enemies and rivals. Although lying, deception, and evasion are accepted as instinctive behavior and discussed widely in the literature of administrative ethic, there are no consensus about the definitions and righteousness of them. Thus, the discussions about lying, deception, or evasion are grouped in two main domains. One is the "conceptual" discussion which deals with the definitional aspect, and the other is the "normative" discussion which focuses on the value and morality of them (Carson 2010; Mahon 2008). Consistent with the problem of definition, the morality of lying, deception and evasion are controversial from different moral perspectives. Some scholars have no tolerance for lying (Kant 2007, 2011), while some others see no problem lying for the happiness of majority (Sandel 2010). Eventually, the question of morality for these activities has different answers from different angles.

Bok (1979) defines lie as an "intentionally deceptive message which is stated" (p. 13), and it can be any form like verbal, written, or nonverbal. Williams (2002) defines lying as "an assertion, the content of which the speaker believes to be false, which is made with the intention to deceive the hearer with respect to that content" (p. 98). Using Williams' definition, Mahon (2008) lists four necessary conditions of lying as (i) statement condition, (ii) untruthfulness condition, (iii) addressee condition, and (iv) intention to deceive addressee condition. Deception, on the other hand, is defined as "causing someone to believe what is false" (Mahon 2008). From this simplicity, Bok (1979) states that deception is a larger avenue which includes lying in it as a part. Evasion can also be seen as a type of deception which aims to mislead as it is seen in Sandel's assessments (Sandel 2010, p. 72). Adler (1997) on the other hand highlights the "intention" condition as a key factor of lying, while it is not necessary for a deception. Moreover, Adler argues, contrary to lying, intentional deceptions can aim "tact, politeness, excuses, reticence, avoidance, or evasion, which are ways to protect privacy, promote social harmony, and encourage interest" (Adler 1997, p. 435). He further notes that putting a makeup or wearing a wig is intentional deception; however, none of them is seen as morally problematic. Although the discussion about the differences of lying, deception, or evasion is so important to evaluate them, lines between these three behaviors could not be so strict. Therefore, the "bold-face lies" and "artful deception" (Sandel 2010, p. 73) will be used to represent two distinctive situations. The term of "bold-face lies" means as an ill-ended serious behavior which may hurt someone as a result and the "artful deception" which most likely cause no harm.

## Morality of Lying

As Cohen (2008) states, lying or deception is a natural behavior even a necessity to deal with the life-threatening situations. In here, the question of

"What is wrong about lying?" could be asked. Indeed, one line of argument justifies deception or even bold-face lies in public sector, if it serves for the purpose of public good. Moreover, as Churchill, in one of his well-known quotes, says "In wartime, truth is so precious that she should always be attended by a bodyguard of lies." From this quote, it can be assumed that war time is a condition for that justification (Cohen 2008, p. 190). Many philosophers like Niccolò Machiavelli, Max Weber, Jeremy Bentham, and Michael Walzer can be seen at the supporters' side, who accept lying and deceiving of public officials as moral – or immoral – but acceptable. This approach, also named as *teleological* approach (Calhoun 2004; Griffin 1989), has consequentialists characteristic. Bentham (2007), as a utilitarian, would see no moral problem in the public officials' lies, as long as they increase the happiness of the majority. Ramsay (2002), who labels Machiavelli as an "embryonic utilitarian," states that Machiavellianism requires that politicians must be consequentialist in their actions. According to this perspective, in order to secure the state and maintain public good, "the end justifies the means" doctrine can be internalized. Indeed, Walzer (1973) cites Machiavelli in his article and notes that "even when he – a public servant – lies and tortures, his hands will be clean, for he has done what he should do as best he can, standing alone in a moment of time, forced to choose" (p. 169). Weber (1946) talks about two types of ethics: one is "ethics of conviction" (Primoratz 2007, p. xiv) and the other "ethics of responsibility." He describes ethic of conviction as acting with the pure intention without considering consequences, while ethics of responsibility considers the consequences of action. Weber argues that ethics of conviction may not work in political life. Griffin (1989) names this situation as "dual morality" which describes two different moral worlds; "one for private life and one for political life" (p. 41). Thus, according to them, public officials can commit crimes and lie for the sake of state and power, as "tragic heroes" who may carry the burden of lying on their shoulders for the rest of his lives (Walzer 1973; Weber 1946). Last but not least, Walzer (2004) introduces a moral dilemma with the title of "dirty hands problem" which describes "a situation where political and military leaders may sometimes find themselves in situations where they cannot avoid acting immorally" (p. 46) like lying or killing.

This line of argument shared above and the reasoning provided represents the supporter's side. On the opposite side of the discussion, there is a line of rejection that does not accept lying or any misleading statements whether in public or private life, as they are absolutely immoral. This approach, named as *deontological* approach (Calhoun 2004; Griffin 1989), points out the "intention" side of the action to determine the morality. Augustine and Kant rejects lying and deception at the center of the action. For Augustine, "lying is always wrong, no matter what circumstances surround it" (Griffin 1989, p. 36). Immanuel Kant (1724–1804), one of the most influential philosophers who contributed the moral philosophy, highlights the human dignity and respect while discussing the morality against the utilitarianism which holds the principle of maximizing pleasure and the greatest good for the greatest number. His opposition to utilitarianism involves that the greatest happiness which gives many people pleasure does not make everything right and moral. In the same vein, any lie or deception which seeks happiness of majority will still be accepted as an immoral behavior from Kantian perspective (Sandel 2010, p. 59). Indeed, the ethics of conviction (or ultimate ends) approach that Weber explained perfectly matches with the Kant's deontological argument of "duty" which makes public officials moral or immoral individuals (Kant 2011).

Kant (2007), while responding to Benjamin Constant's critics in his article titled "On a Supposed Right to Lie," refuses lying in any situation no matter how serious the consequences would be and no matter how noble the reasons behind were. He describes lie as "merely an intentionally untruthful declaration to another man does not require the additional condition that it must do harm to another" (p. 200). As a result, lying is an action that lacks of moral worthiness, as telling the truth is a clear duty, even if the consequences are

seen so serious and detrimental. Even, in an extreme situation of a murderer who asks from a person whether he/she keeps the victim in his/her house or not. The logic behind this position is that if everybody tells a lie in such a situation, society will be evil as a whole that no one believes each other, since the principle of right will be damaged. Moreover, telling lie will be a certain violation of human dignity. Although Constant argues that people should tell the truth only to those who deserve it, from the other side, lying always will become a violation of the "principle of right" (Sandel 2010, p. 71).

Kant (2007) rejects the defense which assumes the lying as a duty in the case of saving one's life. He develops the murderer example by comparing responsibly of the harm caused by truthful statement versus responsibility of the harm caused by a lie. Kant argues that contrary to what is believed that lying will save the victims life, it can cause harm if the victim left from the back door and came across the murderer when he/she continued to look for him/her outside. In that case, Kant claims that the person who tells lie will be the responsible one for the result. For him, even in the situation that the lie does not harm anyone, it is still immoral as it hurts general humanity and the principle of right. "To be truthful (honest) in all declarations is, therefore, a sacred and unconditionally commanding law of reason that admits of no expediency whatsoever" (Kant 2007, p. 200).

Indeed, Kant's argument about human dignity and principle of right is quite persuasive that if everybody tells lie in such a dire situation, there will be no value of right. However, the "clever evasion" that Kant played against the King Friedrich Wilhelm II is opening another discussion which provides a useful tool for not lying. In short, King Wilhelm requests from Kant not to write about religion, Kant accepts King's request with a carefully selected words "As your Majesty's faithful subject, I shall in the future completely desist from all public lectures or papers concerning religion," while he is predicting that King will not live long. After King's death in a couple of years, Kant starts again his writing and lectures about religious by defending himself as he was not lying as the pledge he used was only valid during the King's life. Considering Kant's artful deception, Sandel (2010) develops the murderer example and offers a wise solution for not to tell lie. In a dire situation which you are hiding one of your friends from a killer, instead of helping murderer by telling the truth for the sake of morality, people can tell another truth which allows us to refrain from lying. Like the example of Clinton given by Sandel, the president's response to drug experience question in presidential campaign has no lie but party misleading. "I had never broken the antidrug laws of this country or state," although he tried a pot in England while he was a student in the late 1960s (2010, pp. 71–72). Cohen (2008) names this misleading impression as being economical with the truth (p. 190).

Sandel (2005) uses another Clinton's deception (Monica Lewinsky) as an example to express his position about the private and public life difference from moral perspective. According to him, preference of not telling the truth about a private misconduct can be more justifiable, when it is compared with the issues related to public. Sander also shares Johnson's intention of concealment about Vietnam War and Roosevelt's denial about World War II involvement in his assessments (109).

Lie is harmful, and when it becomes the characteristic of the relationships, it will definitely not only works for its reasoning (even noble or simple) but also destroy the social life. However, for the case of deception, ways of finding the truth can be found with additional questions and critical thinking. This is how the lawyer use deception for their goods and how they deal with the others' deceptive tactic (Sandel 2010, p. 73).

This part of the moral debate is providing the "room of tolerance" in lying and deceiving in public sector. Bok (1979) is offering a moderate way in her seminal book which seems quite similar to "artful dodge" (p. 72) that Sandel (2010) mentioned. Her examination involves both strong and weak sides of teleological and deontological approach. She asks the same question how acceptable lying and deceiving people. She sees "white lies" and unintentional deceptions which emerge unexpectedly more innocent than the bold-face

lies like public officials use occasionally with all due respect for the public good.

Bok (1979), by accepting white lies in some degree, offers a couple of security walls for lying in order to make it difficult for people to use lying as a tool. "Principle of veracity" is one of these walls which tells without a plausible explanation everybody has to refrain from lying and prefer truthful statements (p. 32). The second wall is "need of publicity" to justify the lie which might be quite difficult, when we consider public officials who find them in a position (like President Clinton) situation of defending (p. 96). Bok's security walls are drawing limits for public official that shows how far they can go. Furthermore, her principles are giving the answer of when and for what purposes public official can tell lie or deceive. Even for the situation of telling lie for the public good, public officials have to have permissible reasons. If they cannot provide those explanations, like Bok's suggestion, they should prefer truth (Bok 1979).

The other consideration comes from "white lies" and individual rights argument. Bok (1979) providing some examples with the doctor-patient relationship, emergencies, and innocent situations in her book. Although most of the religions accept lying as one of the biggest sins, a level of justification is given for "white lies" which have peaceful purposes. In Islam, for example, Muslims are allowed to use white lies: (i) when they are in a danger, (ii) when they want to restore husband-wife relationships, and (iii) when they are assigned as a peacemaker between two groups. Talmud also allows its believers to lie in three situations: "involving knowledge," a researcher can hide his knowledge whenever he/she needs; "hospitality," a person can lie in order not to make the home owner unhappy; and "sex," a partner can avoid telling truth when asked about performance of his conjugal duties (Sandel 2005, p. 110). One last assessment can be highlighted here by citing Sandel's Clinton example. He uses "sex" exception to provide a defensible argument for president's deception. According to him, Clinton has the right of deceiving or even lying as the issue is related to an individual right. Therefore, it can be argued here, when individual rights are the subject of the issue and there is no harm from not telling truth, that public official might prefer hiding the reality from others.

## Conclusion

The question of morality and possible moral differences between a lie and a misleading or evasive truth is facing with its first challenge at the definition phase. The literature falls short to provide clear lines among lying, deception, and evasion. As Mahon (2008), Adler (1997), and Bok (1979) deal with the definition of these behaviors, many factors are on the stage which may affect the concept and meaning of these terms. Using "not telling truth" as a term instead of lying or deception might provide a better picture. Beyond the definition discussion, there is an old prevailing debate in the moral philosophy which seeks the answer of "what is right and wrong" and "what is the right thing to do" to decide the morality of lie, deception, and evasion. There is a grounding to support, reject, and partly accept the lying and/or deception in the public sector. These approaches can be summarized as teleological, deontological, and middle-way approaches.

### Synonyms

Cogovernance; Comanagement; Creative management; Decentralized management; Dynamic management; Innovative management; Neo management

### Definition

Management Innovation: A creatively dynamic approach to leading and ordering an organizational setting; a critical shift from the normal and formal management environment to a new and promising one; new idea in management theory and practice; exploring new alternatives in public service delivery.

Power Sector Governance: Mutual management of the power sector by both the state agency and the power users; decentralized power management model involving the citizenry; building linkage between public and private management of the power sector; people-focused approached and management perspective drawn from their user-experience(s).

> First of all, worldwide trends toward democratisation have opened the door to citizen demands for a more active say in the "what and how" of governance. (Brinkerhoff 2000, p. 239)

### Introduction

In recent times, there has been growing concern about administrative reforms, inclusive representation, and social accountability in Nigeria-Africa as a way of engendering efficiency, effectiveness, and a sound-administrative governance nexus through enhanced citizens participation, transparency, and openness in a democracy (Idike et al. 2019; Ukeje et al. 2020a; Ndukwe et al. 2021). Given that the "citizens are no longer tolerant of abuses of public trust and of the malfeasance of the past; they expect accountability and transparency" (Brinkerhoff 2000, p. 239). According to Farazmand et al. (2019, p. 10), citing Farazmand (2017), globalization has made the citizen-

government relationship more bilateral, changing the status of citizens from a "captive audience" of the local public administration to active "citizens." In Nigeria for example, this scenario has led to "endsars" and "end bad governance" protests including breaking into government warehouses to reclaim palliatives supposedly meant for citizens but being hoarded by the leadership for no tangible reason. Importantly, the citizens in a democratic state represent the epicenter in the attainment of sustainable development goals and targets by 2030 (Chukwuemeka et al. 2020; Idike et al. 2020b) and a critical element in the entire governance process (Ukeje et al. 2020b). According to Idike et al. (2020):

> The purpose of government and governance everywhere in the world in human societies is to meet and provide for the basic needs of citizens, as well as to manage the collective affairs of society in a manner that enhances the welfare of the citizens and promote sustainable and progressive development in the state. (p. 1)

However, the management of PEs in most African countries has been influenced by some political underpinnings and other environmental factors which in turn had slammed on the managerial efficiency and effectiveness of the public enterprises (Okpata 2004, p. 175). This has great implications not only on the management of PEs but also in the overall attainment of reliable and citizen-centered Power Sector Governance (PSG) and sustainability in developing countries. According to Okpata, Nigerians, having imbibed a wrong cultural value of exploiting public offices for personal gains, perceive a successful bureaucrat on the basis of wealth indices; thus, the wealth a public officer possesses becomes a measure of his managerial success, rather than his achievement of organizational set objectives (Drucker 1967). Gradual deterioration of the Nigerian bureaucracy in terms of service delivery has necessitated a historical review of reforms with a view to proffering a conceptual solution (Ukeje et al. 2019, p. 4).

This cultural value of looting public treasury informs the nature of the influences of politics on the management of Nigerian public enterprises since the 1980s, thereby giving rise to a kind of policy reform for enhanced service delivery. This policy decision was also informed by the frequent inability of these enterprises to generate the expected surplus, hence the need for alternatives to improve on the general performance, after several administrative reforms and institution of probes and inquiries into the management performance of our public enterprises failed to reposition the sector on the side of higher performance and citizens satisfaction.

This agrees with the position that "public sector governance issues, challenges, public service delivery, and outcomes for communities and societies are very central and critical to the study of management in Nigeria especially in an era of heightened corruption and mismanagement" (Ndukwe et al. 2021, p. 1); hence, the need for a management innovation – a kind of management shift and dynamics in the entire service delivery processes. Since there has been a relentless search for most adequate service provisioning mode that will induce accountability and efficiency in Nigeria public institutions (Idike et al. 2020a), studies on public accountability, corruption, and anti-corruption efforts have insufficiently dealt with coordination and control of related reforms in public organizations (Onyango 2018, p. 4). For instance in the words of Ezeani (2006, p. 225): power supply in Nigeria is unreliable; consequently, most PEs rely on standby generators which cost much to purchase and maintain.

Lending his voice, Ukeje et al. (2021) assert that:

> The privatisation of public enterprises in Nigeria was simply the personalisation or commoditisation of these outlets. The political elite sold the structures to themselves and used them as a patronage extensions. The patron-client network was built overtime and maintained. Appointments into the service delivery outlets were based on "Ima mmadu" (whom you know) that is, connection.

Thus, a sense of urgency to address electric power failure in Nigeria has always greeted many elected officers. This is revealed in concerted efforts they tend to exhibit at the inception of their administrations. However, till date, Nigeria still experienced epileptic power supply. Again, even before he was elected in 2015, President Muhammadu Buhari made campaign promise to resolve the

power sector quagmire. In his New Year message to Nigerian, Buhari (2020) asserts:

> Power has been a problem for a generation. We know we need to pick up the pace of progress. We have solutions to help separate parts of the value chain to work better together. In the past few months, we have engaged extensively with stakeholders to develop a series of comprehensive solutions to improve the reliability and availability of electricity across the country. The solutions include ensuring fiscal accountability for the sector, increasing both government and private sector investments in the power transmission and distribution segments, improving payment transparency through the deployment of smart meters and ensuring regulatory actions maximize service delivery.

Campaign promise on revamping the power sector has been one of the winning points of many Nigerian presidential candidates. Needlessly to say, campaign strategy of capitalizing on solving perceived "wicked problems" in Nigeria is a tradition and culture of Nigerian politicians. Though with little or no concern about their capabilities, they indulge in "big" promises but divulge in real actions. Power failure is a type of "wicked problem" in Nigeria. "Wicked problems" in Nigeria are those problems that Nigerians know how to solve but cannot solve them. This area too needs serious research attention. Electric power is the lifeline of economic development and socioeconomic wellbeing of world families. Electric energy demands occupy the top place of global priority. Accordingly, it is the most desirable and most used form of energy (Oyedepo 2012). It constitutes huge capital expenditure in Nigeria, where its persistent failure raises a question mark and instigates the tendency to probe electric power funding.

In this article, we are making a case for integrating the people into the production and management dynamics of the electric energy, which agrees with the concept of cogovernance, coproduction, and comanagement as sustainable solutions to the energy problem in Nigeria power sector. Apart from obvious problems of understaffing and poor conditions of service, a major problem of the energy sector is the disconnect between the energy management system and the citizenry. Good service management rather than privatization is required to make a public service organization more efficient and effectively outward-oriented (Gronroos 2018, p. 1). However, this state of disconnect in the energy management sector is compounded by the capture of the energy regime by comprador bourgeoisies referred to as "witches and demons" (borrowing the metaphor of former Minister for Power, the entrenched interest of these powerful few has led to the formation of energy regime mafia-empire that is pitched against poor Nigerian majority).

Drawing from a hypothetical principal/agent conceptual model in a recent study on "Politics of Patrimonialism, Influence of Principal/Agent Relationships on Discretionary Powers of Street-Level Bureaucrats in Nigeria," published in Global Encyclopedia of Public Administration, Public Policy, and Governance (see Ukeje et al. 2021), the elite stakeholders in the power sector through their networks employ incompetent workers who eventually exhibit their incompetency at the frontline which results into service failure. This entry further argues that the third-force alternative – which serves as a form of management shift and cogovernance dynamics – can help to bridge the gap between the citizens and the EEDC through its feedback mechanism and comanagement roles in the power sector. Therefore, we learn from the existing model of sound governance (Farazmand 2004, 2017), to construct a policy pathway for arresting erratic energy situations in Nigeria. Sound governance aims at identifying best ways to ensure citizens' productive participation (Farazmand 2004). We advocate for a power management innovation model that will give citizens a sense of ownership and collective responsibility to ensure energy sustainability.

Innovative management model entails creating a third layer citizens' service management system, interfaced with the mainstream service provision management channel. Existing frameworks in Nigerian public service delivery processes have failed due to lack of government-driven efforts to engender efficient and timely service delivery (Idike et al. 2019; Ukeje et al. 2020a) due to the fact that scholarly "literature on bureaucratization and service delivery, particularly the Nigerian bureaucracy, has not done much to seriously

conceive bureaucratization as action taken toward increased controls and adherence to rigid procedures in ensuring citizens' satisfaction" (Ukeje et al. 2019, p. 2). The theoretical model we are proposing is an independent citizen's initiative and establishment; a kind of citizen's centric service charter and social accountability platform in the power sector. The data we gathered from the citizens show that they are more comfortable with citizen-centric institutional initiatives rather than one mid-wifed and sponsored by the government. The reason is that they have full control of this kind of establishment and can be objective, rejecting, or accepting any proposal presented to them without fear or favor. With this kind of citizen-oriented formidable force, interaction with government agencies will normally be on a neutral or leveled ground. Ultimately, the result is a collaborative management effort between the government and its citizens.

## The Nigerian Power and SDGs 17

According to the UN General Assembly (2015), sustainable development is a development that meets the needs of the present without compromising the ability of future generations to meet their own needs (Table 1).

Meeting energy needs of Nigerians should occupy a central place in government policies. Energy supply is a necessity in order to achieve socioeconomic development (Okafor 2008). World over, electricity is a top agenda and draws the most popular attention among both developed and developing states (Olugbenga et al. 2013). Nigerian manufacturers have consistently identified poor power supply as the most important constraint to their business (Akinbami and Momodu 2012). Despite several efforts at ameliorating the challenge, indications are that solution to the current situation is missing. This awareness gave us an impetus to seek and then to present an innovative idea on how to solve the problem. Evaluation of management performance of the power sector would have gone a long way to show which area in the production, distribution, and delivery system that needed attention. However, lack of this database is one of the challenges that the system is facing. Performance management is concerned with how performance information can be used in making future decisions (Kline and Aristigueta 2017). As noted earlier, we propose a decentralized management system that will integrate citizen into the power management system through a citizen-led alternative management initiative. The emergence of new scholarly thought on Dynamic Performance Management (DPM) was inspired by the need to address "wicked problems," which demands detailed and time-specific performance tools (Kline and Aristigueta 2017). Addressing "wicked problems" in Nigeria demands dynamic management tools that involve the people who are the ultimate product users.

**Management Innovation and Power Sector Governance in Nigeria, Table 1** Overview of sustainable development goal 7 targets

| Goal 7: "Ensure access to affordable, reliable, sustainable, and modern energy for all" |
|---|
| 7.1 by 2030, ensure universal access to affordable, reliable, and modern energy services |
| 7.2 increase substantially the share of renewable energy in the global energy mix |
| 7.3 double the global rate of improvement in energy efficiency |
| 7.a by 2030, enhance international cooperation to facilitate access to clean energy research and technology, including renewable energy, energy efficiency, and advanced and cleaner fossil-fuel technology, and promote investment in energy infrastructure and clean energy technology |
| 7.b by 2030, expand infrastructure and upgrade technology for supplying modern and sustainable energy services for all in developing countries, in particular least developed countries, small island developing states, and land-locked developing countries, in accordance with their respective programs of support |

## Coproduction, Comanagement, and Sound Governance

Coproduction can be defined as a practice in the delivery of public services in which citizens are involved in the creating of public policies and services. It emerged emphasizing the relegated important roles clients could play in improved outcomes of service design and delivery (Puolokainen and Jaansoo 2018). This is also an outgrowth of concern for government and citizens interactions as opposed to the previous management systems. The historical trajectory of management evolution recognizes that there had existed management styles and systems that outlived their relevance. Old Public Administration characterized by centralized management system and rigid administrative structures saw government as an almighty producer and dispenser of public goods and services. This outrageous confidence was humbled by the stress and strain on government resources occasioned by their sole production and distribution of economic and social goods and services. Also, the end-users lamented the inefficiency of the system to meet their needs, monopolistic nature, and limitations of choices. The government was pressurized into relieving their burden to the private and engaging them in service provision. This was captured under the nomenclature of New Public Management. However, because profit maximization (Powell 2016) and less concern for social welfare are the core features of this production and service delivery system, the citizens were still dissatisfied. New Public Governance emerged amid the need for coherence and coordination in service delivery system (Puolokainen and Jaansoo 2018). There was still dissatisfaction among the people calling for the need to engage the people directly in the management dynamics, hence, coproduction and comanagement.

Be that as it may, this management model can also fail if sound governance principles are not considered in its design and practice. Sound governance has been propounded as an alternative model to good governance. Sound governance relies on citizens' engagement, citizens' participation in various forms, institutionally and politically (Farazmand 2017). Thus, Farazmand (2004, p. 19) noted:

> Innovation is key to sound governance, and innovation in policy and administration is central to sound governance. Without policy and administrative innovations, governance falls into decay and ineffectiveness, loses capacity to govern, and becomes a target of criticism and failure. Sound governance therefore demands continuous innovation. . .

Knowing that the laboratory of innovation is the society, a platform for harnessing and tapping it is a society invented production space under their complete control and governance. That is, the alternative dynamic management initiative of the citizenry, which we propose, that will serve as an organized interface between the state and the citizen. The medium will permit innovation, policy design, and management style harmonization for better impact. It will also help the government to reconcile citizens' grievances and understand their dissatisfaction. Studies have shown that various reforms in Nigerian electric energy sector have failed to achieve their intended objects (Ohajianya et al. 2014). One of the reasons given for this is unfettered corruption (Okafor 2008). Others have cited inefficient management system (Oyedepo 2012) while yet others identify lack of political will and vested interests as the cause of policy reform failures (Ohajianya et al. 2014). So far, no study has examined the dimension of co-production buoyed by sound governance principles in search for solutions to perennial power failures in Nigeria.

Comanagement of public institutions is an arrangement where citizens induce changes in public policy or organizations and are themselves required to act in a certain manner to complement the change or reform they induced. A continuous process of supportive interaction between government agencies, "the third sector and the community" (Pestoff 1992).

In the Nigeria Power sector, meterage was introduced as a way of ensuring accountable power use by citizens that is commensurate with the price they pay. The present variant is the prepaid type where prepaid meters are installed for distribution companies' (DCs) customers who

are allowed to purchase vouchers from the service companies recharge and use them as they desire. This immunes them from possible exploitation by the service companies, and at the same time compel them to adopt voluntary conservatory use of power resource in their homes.

This study found that those who have prepaid meters ration their power resource to specific appliances needed for time. For example, some switch off their television and stereo set when refrigerator is powered on or choose which light bulb to power depending on what is needed. Some switch off entire lights while going to bed and finally, people who have prepaid meters choose to use "energy-saving bulbs." These are uncommon practices: a depart from the pervasive culture of waste and mismanagement among many Nigerians. For example, in the course of fieldwork, this study found that consumers on bulk billing option are randomly given monthly bills (estimated billing system). This category does not have the conservatory culture of those with prepaid meters. It is believed widely that metering will help to curb wastage of generated power, reduce inefficiency, engender constant power supply (since DCs' net returns would depend on power availability and use by customers); and mitigate corruption in the entire process. Surprisingly, the DCs have been dragging their feet to fully implement the policy despite government white paper and order to do so. The challenge of meter installations has even been debated by the Nigerian Senate and a position declared. Till date, it remains curious why the policy is yet to be consummated. Only a few who have the wherewithal to demand for meters and beat the deliberate bureaucratic obstacles to getting the meters have them today. This is despite the glaring gains of the prepaid meter innovation.

One challenge identified to be facing the prepaid meter policy is the activities of "comprodo bourgeoisies" (the witches and demons). Most of these "powerful individuals," businessmen and politicians command enormous influence in the circle of power due to their "contributions in forming the government" and have understandably become "sacred cows" immune to government reforms and punitive force. In such a situation, government nationally becomes weak and idealistic. Although this is neither peculiar to Nigeria nor third world governments, there is a marked difference in the resource power and motivation of government between the two worlds due ostensibly to the level of citizens' expectation and participation.

It is a citizen-based public accountability mechanism which allows citizens to hold their government accountable, demand performance of contract, seek compensation for injuries, and mitigate abuses of public privileges. Where citizens' expectations are high, public accountability is also high, and progress in public agencies is raised as well. This is especially useful for developing democracies where semblance of authoritarianism still persists leading to personalization of state apparatus. There is however the need to develop an instrument for measuring it vis-à-vis courses that raise and encourage or undermine it.

## Citizens Expectations and Probono Community-Led Management Initiative Experience

As stated earlier on, many theories have been adduced to explain the power sector malaise in Nigeria. One being the Mafia theory referred to as "witches and demons," a sort of conspiracy theory as noted by the then Minister of Power in Nigeria. Presently, there exists a pseudo-partnership between EEDC and its customers. There is what is now an informal organization or arrangement called Community Electricity Management Committee; a citizen/customers platform responsible for the collection of utility rates (charges) from power users on monthly basis and remitting the same to power distribution companies. This structure as noted earlier is informal and mainly exists in communities where the buck-billing system is being used. It has no statutory responsibilities and has no enforcement obligations in so far as EEDC is concerned. That is, it does not contribute to decision-making in the company. Yet, its revenue drive activities hardly exclude it as a veritable management layer of the organization.

In the course of this research, the committee was found to play critical coproduction roles such as replacement of damaged transformers, repair of dilapidated low and high tension lines, fault reporting, revenue collection and remittance, disciplinary enforcement through informal mechanisms and networks, but not on the company or its staff; and security of power infrastructure.

But it was also observed that these committees did not have a sense of direction in terms of what they want and how to get them either from the companies or government. For example, committee members reported that they do experience service failure many times, often with no explanation or notice from the DC, and that they lacked capacity to deal with the problem. In fact, a respondent said:

> We had no power supply for over 8 months now. About three months ago, we started effort to repair our damaged transformer which they refused to replace. Before we began to try to repair the transformer through freewill donations from people in the village, we had gone to EEDC for over 3 months just to get them to repair it. They kept telling us that they were bringing new transformer for us from Lagos that we should be patient. Having stayed for about four months and nothing happened, we decided to try politicians. Eventually, we got a development center coordinator, who donated refurbished transformer to us. This blew up immediately it was energized. Frustrated, we decided to contribute money to repair our own. The first attempt failed and we were forced to contribute money a second time to buy a new one. It cost us close to 3 Million naira to install a 300KVA transformer. What was disappointing was that after we installed it, to energize it became a problem. The company said we did not seek their permission before helping ourselves. We had to begin crossing hurdles, writing letters and wielding influence here and there before the transformer was eventually connected to power. Till date no appreciation has come from EEDC to us.

## A Potent Sign from EBSU Students Community

What demonstrates the management prospects this layer (third force) of interaction holds if formalized and empowered is the typically enforced relationship that exists between the EEDC and Ebonyi State University Students Community. It is now a popular knowledge that during school holidays, power supply is usually erratic but steady when they return to their campuses. Researchers found why. Students are known to protest very easily and even involve in riot, to the extent of destroying some infrastructure and even assaulting EEDC staff. As a result, the company's staffs are afraid of the students' activities, sometimes using the punitive billing system noted earlier in this article as a retaliatory measure. Even so, there is always resistance from students, leading to reversal of the action by EEDC.

## Incentive to Perform

In the course of this article, we identified one of the reasons for the paucity of power infrastructure to be afraid of losses resulting in rationalized investment mode by investors in the power sector. Most of these investors are big sponsors of government. It is as if the government is deliberately creating monopolies as political compensation and support matrix. So, it is not news or surprising that there are "witches and demons" in the business or power sector in Nigeria. These individuals have a business interest in the oil sector. And this is the sector that supplies gas to power generating plants (a stratum of power problems in Nigeria). Yet, the incidence of students encounter with the DC mentioned above was able to elicit desired service from the same DC controlled by these "witches and demons." This uncovers major weakness of the "Mafia gang theory" and rather demonstrates eloquently that the people can get service institutions especially those within the domain of government, to function as they should; provided the popular will is there.

## Popular Will and Political Will: A Nexus

Popular will presupposes the general will of the people expressed in their expectations on their government in relation to public good deliverability. On the other hand, political will is the resoluteness of a legitimate political authority to

deliver on its contract with the people it represents; overcoming in that process challenges both from within and outside government and country. The two are, however, mutually exclusive concepts but are rather mutually dependent and re-embracing. Where political will is weak, popular will has been seen to play critical roles in energizing it to overcome its challenges to perform. This experience is more frequent in the developed democracies. On the other hand, political will can strengthen the exercise of popular will by creating structures (legal, social, and economic) that boost citizen's political awareness and broaden opportunities for them to participate in government.

## The Dilemma of Mutualism in Nigeria: Identifying the Challenge and Raising the Bar

In the consummation of this study, an agenda is herein proposed – that the Nigerian state seeks to empower its citizens to participate more in government through co-management of public institutions. It is proposed that a law which leaves debts of liabilities for lawful damages on service institutions will certainly buoy citizens demand curve and increase accountability since service providers will have to choose between extent of avoidable liability and the cost of rendering expected services to the citizens.

This has been proven by the students; that irrespective of the presence, imagined, or real witches and demons, service companies have been compelled by citizens to render services as expected and that when it is possible for them to withhold this service in the form of power rationing or load shedding, and they will conveniently excuse themselves from responsible activity. It might be important for a formal recognition and empowerment of the existing informal structures (community electricity management committee) through statutory instruments that assign them, limited but clearly defined rights and responsibilities in the service provision process. This way, the focus of the witches and demons will be diffused from government to a more resistant area – the society of which they easily lose control. This way, the two areas (politics and society) will mutually strengthen each other.

## Lack of Control and Supervision

The dimensions of citizens' expectation are herein explored first for clarity of understanding. As a mechanism of interest articulation, aggregation for the citizens offering opportunities for input-output maze in the public policy process, citizens' expectation framework has the following dimensions:

- Sovereignty of citizens' interest (sovereignty will)
- Limited liberty
- State service
- Partnership: cogovernance, comanagement, and coproduction

Hence, citizens' expectation hinges on the undisputed sovereign will of the people based on the social contract of state responsibility. Emanating from this is such liberty for citizens permissible within the framework of law. The nature of what is being proposed here may appear contradictory, but it is not at all. Limited liberty is used here in the sense of modern democratic exercise where individual liberty and mass action are free from the manacles of state dictatorship but free from elements of anarchy. This way, both state and popular forces are restrained within the ambits of lawful action. Then, the absolute recognition of the essence stated with all its agencies and paraphernalia-service, service to the people, that the state loses legitimacy and taste, the moment this obligation is put in jeopardy.

Lastly partnership: This is where cogovernance, comanagement, and coproduction have emerged which is where this article is based. Study found that the state and its agencies are displaced from the reach of the people. Our survey showed that there is little or no control over government or its agency. With the continuous experiences of service failure by the EEDC customers, the service company could not be held to account either by the

government or the people. For instance, there is no robust, effectual customer relations programme and feedback mechanism for managing company/customer relationships, except for a frequent "lself-help" measures like riots, bribery and assaults on EEDC staff, undertaken by "disenchanted and frustrated" customers as last resort responses to service failure; a fundamental problematic for the service pact and for co-management.

## A Fundamental Problem

Many theories may have explained the dysfunctionality of Nigeria public institutions and the disappointing programs or the less attractive privatization policy. Perhaps, a good explanation is the entrenched, pervasive rent-seeking and clientele network between public officers in Nigeria and their cronies in the market sector. It is no news that public officers use their cronies to acquire public assets and stocks under pretentious privatization or PPP programs in Nigeria. And so, the complexities of interest make it difficult for meaningful, responsible control over public policies like PPP or outright privatization, what is here referred to as interest demagoguery.

## Creating the Third Force

Importantly, engagements of citizens through active participation is key in the development of any nation, state or institution and enables the citizens exercise their legal rights, meet their obligations and mediate their differences devoid of all kinds of restrictions in addressing their peculiar problem (Ukeje and Chukwuemeka 2021). Thus, as identified earlier in this article, there is an informal structure which serves as an interface between EEDC and its customers. Its name and structure vary from place to place. The problem, however, is that this body has no formal, legal authority to exert considerable influence, as much as advisory, in the management of EEDC. An interviewee regretted this fundamental lack, thus:

> Yes, I am a member of the committee, I have served in it since 2010, the problem is that the committee has no definite responsibility and powers. It is not even recognized by law. So, you do not have the right to take any action. Our duty is just to collect monthly bills and remit to them. EEDC! WE also complain to them if there is fault anywhere but many times, they respond when they want to, especially when the fault will cost money.

Asked whether he thinks they could control the activities of EEDC, another customer said.

> Yes we can. There are many ways we can do that. One way is to have a dedicated account where certain agreed amount will be deposited from the monthly bills. The money will then be used for prompt responses to issues concerning power. If this is done, you will see that EEDC will not want that deductions to be expended anyhow. They will do something to ensure that the money becomes asset for them. EEDC officials and nominated members from the committee will be signatory to it. But the problem is that we do not have the power and responsibilities to us. They are talking now about state and community policing. But nobody is talking about policing public institution.

The response above makes clear the needs for a "third force" in the management of public assets especially PPP programs as EEDC/Government pact is. It is believed that this will curb exploitation and resolve service failure reasonably.

## Benefits of a Third Force

1. A third force will help to reduce exploitation as stated above. It will, if empowered to do so, be integral to the service process, the entire process of managing the service machinery – procurement, preservation, maintenance, and development of power infrastructure. This way, the normal and frequent excuses of EEDC staff will not hold water.

   A committee member agrees:

> It will help a lot. At least these excuses they use to give will no more be there. We will know how much our bill actually is. Not this one that they just give you any amount they like every month which is not static. It changes every month whether there are activities that consume power or not, you must pay. If you ask for meter, they will say it is in America, in London and such excuses so will not get the meter. If government makes us part of the

process, we will be able to know when meters are available or to even request EEDC to order for some from the consolidated fund.

2. It will serve as a platform for popular mobilization: The people could be a veritable resource for public good. EEDC as presently constituted is understaffed. This committee can provide alternative human resource intervention for the EEDC with little or no cost at all.

   Respondent 3:

   Indeed EEDC is missing a lot.

   Presently, they are understaffed. Yet you cannot go near their facility even if you know what to do. In many occasions, trees and grasses cover their facilities: transformers, wires and poles. If they do not come to clear it, nobody would, because their transformers are usually fenced. Again, sometimes, there could be a minor fault which somebody can handle with little training. Sadly, this too will have to wait for EEDC staff, sometimes for days, weeks and months before they are corrected. We have members in our committee who trained as electricians, who do wiring in houses and even join the EEDC in connection and disconnections. But they are more about the money than about service.

   Providing reasonable technical training for some members of this committee will help make up for the human resource gap in the campaign.

3. Interest Melting Pot: as already established in the course of this discussion, the relationship between the state and the witches and demons seems growing and intractable. Note: for example, the lopsided war against corruption in Nigeria under President Buhari. Members of the opposition who are accused of appropriation or embezzlement of public funds either in private capacity in dealings with government contracts or in public service capacity are promptly excused once they defect to the ruling party, All Progressives Congress (APC). As noted previously also, these people serve indispensable political stock for the ruling elites and at this point, the state apparatus goes willfully blind. This is not peculiar to Nigeria. So, vested interest is not, pragmatically speaking divorced from the state. What is different among states with respect to vested interests and inertia is the degree of influence it wields in value allocation and the established institutional mechanisms for resolving them. That's what distinguishes one state from another.

   In the case of Nigeria, it is clear that a third force will hold the key to resolving this conflict in a continuous fashion. It will stand as an objective force moderating the excess of the private business and the overbearing posture and deliberate docility of government to act in areas it has vested interest.

   Respondent 4:

   I think we can do so many things. For example, we cannot be influenced by politician or private investors not to work and to remain in darkness. How many people can you bribe or influence any other way? For example, if our duties are clearly spelt out by act of parliament such that the government cannot override us lawfully, we can withstand government and its agents or cronies. They won't have choice than to do the right thing. Don't forget that communities will have their own management committee; with the members reporting to a government ministry or commission (suppose your idea works).

## Reinventing Feedback Techniques and Complaints Management: Issues and Challenges Imperative for Sound PSG

The importance of feedback techniques and complaints management is an integral part of effective PSG. It is noted that communication itself is an element without which service delivery by any organization will be impeded. It is an indispensable component of effective communication. The utilization of the feedback mechanism by a distribution company like EEDC enables the organization to devise ways and strategies to improve on or adjust in order to ensure optimum output. Anaekwe (2018)

explains that the source is intently anticipating a feedback from the receiver, having initiated a carefully orchestrated communication message aimed at influencing, impacting, or affecting the decoder. According to Kurtulus (2011), the effectiveness of the entire communication process is thus measured by the effect which the message exerts on the receiver.

Bringing the EEDC to the power front, multiplicity of complaints flood into the distribution company. Such letters are suffered from issues such as power outage, over-inflated bills, estimated bills in the presence of meters, disconnection problems, and failure of the institution to respond to customer's complaints, among others (Udeajah 2017). According to Brewer (2007, p. 550), complaints arise because citizens experience inappropriate or discourteous treatment, omissions, mistakes, faults, inconsistencies, misleading guidance, unclear procedures, or displayed bias or injustices in their dealings with public officials.

How EEDC responds to these complaints is an issue of great concern to this research since the bulk of customer dissatisfaction with the performances of the Company tends to result from a communication gap between it and its numerous customers; particularly arising from the power consumers being completely left in the dark as regards the handling of their oral/written complaints and formal/informal misgiving registered to the company (NERC 2016).

Examining the relationship between EEDC and its customers, the use of feedback explains whether things are going in the right direction or whether a direction is needed (Hardavella et al. 2017). The absence or ineffective use of the feedback mechanism by an organization, this, has cost implication. David and McGarthy (2015, p. 1) are of the view that "feedback is the process in which part of the output of a system is returned to its input in order to regulate its further output . . ." Not just in EEDC, in every organization, feedback is instrumental to getting the organization on track and serves to guide people in knowing how they and others perceive organizational performance. Feedback, therefore, should be regular and appropriate so as to serve the management in making decisions that promote organizational goals and objectives.

## Conclusion

This article tried to make a case for integrating the people into the production and management dynamics of electric energy which agrees with the entire concept of cogovernance, coproduction, and comanagement as sustainable solutions to energy problem in Nigeria power sector. The article further argues that the third-force alternative which serves as a form of management shift and cogovernance dynamics can help to bridge the gap between the citizens and the EEDC through its feedback mechanism and comanagement roles in the power sector. Management innovation in the context of this study implies a creatively dynamic approach to leading and ordering an organizational setting; a critical shift from the normal and formal management environment to a new and promising one; a new idea in management theory and practice; and exploring new alternatives in public service delivery. This can only be achieved through: mutual management of the power sector by both the state agency and the power users; decentralized power management model involving the citizenry; building linkage between public and private management of the power sector; and a people-focused approach and management perspective drawn from their user-experience(s).

Importantly, since citizens' awareness, expectation, and engagements are necessary tools and pathways to an accountable and reliable governance system, one way to promote accountability and responsibility among public office holders might be to provide beyond-border supports for civil society groups currently starved of finances, sense of belonging, and other logistics. This way, they will engage the government better. One problem area however is that government may see that as infractions of its sovereignty and international meddlesomeness in its domestic affairs capable of causing diplomatic upset. But there are many ways of doing these things.

This makes the subject of this entry germane as additional causal insight into the outcome

differential often observed and as an additional contribution to energy policy literature. Because there seems to be no difference in diagnostic and prescriptive research parameters across regions despite the larger social, cultural, technological, and politico-administrative differences surrounding energy programs and policies of several regions, we highlight the imperativeness of specificity of research, taking recourse to environments peculiarities as codeterminant of energy policy outcomes in a prevailing condition of state capture.

# Management of Immigration Crisis

Steven G. Koven
Department of Urban and Public Affairs, University of Louisville, Louisville, KY, USA

## Synonyms

Administration; Emergency; Entry; Migration; Resettlement; Supervision

## Definition

Management of immigration refers to oversight of migration patterns. Immigration crisis refers to native anxieties regarding border control and entry of undocumented migrants.

## Introduction

America is said to be a nation of immigrants. Successive waves of people migrated to the United States from the time of the earliest settlements to the present day. Each wave of immigration was greeted with a great deal of anxiety. In response to this fear of foreigners, in the late 1790s, colonists sought to limit entry of "others" by passing the Alien and Sedition Acts of 1798. Between 1830 and 1850, antipathy toward Catholics (mostly Irish and German) accelerated. Deadly anti-immigrant/anti-Catholic riots broke out in major cities such as New York, Philadelphia, Boston, and Louisville. Beginning in the late 1880s, opponents of immigration passed the Chinese Exclusion Act of 1882. This legislation was followed by other restrictive laws such as the Quota Act of 1921 and the Immigration Act of 1924. Immigration, particularly immigration from Southern and Eastern Europe, declined precipitously as a result of the restrictive legislation (Koven and Götzke 2010, p. 11).

In recent years, opponents of immigration have reared their heads and made immigration a major

political issue. Spurred on by growing numbers of immigrants, stagnant wages for many Americans, fear of terrorism, perceptions of a "broken" immigration system, images of porous borders, and inaction from Congress and political figures generated various proposals. These plans include ideas such as building a wall between the United States and Mexico, deporting undocumented immigrants, and terminating Muslim immigration into the United States. Xenophobic-oriented measures, however, were sharply criticized by some leaders as being out of step with American values, impractical, mean spirited, or simply too costly. Nevertheless, many Americans embraced these restrictive proposals as necessary and proper for a country that was losing control of its borders and losing control of its future.

In order to assess the various strategies and plans for managing immigration, this chapter will (1) review previous immigration trends, (2) discuss economic and cultural anxieties related to immigration, (3) identify contemporary legislative proposals, (4) discuss restriction and assimilation options, and (5) offer tentative conclusions.

## Immigration Trends

In 2013, over 40 million foreign-born people resided in the United States, a number representing 13% of the total US population. This proportion is comparable to the share of foreign-born residents in the United States between 1860 and 1880 yet is lower than the 14.8 share present in 1880 and the 14.7 share in 1910. In absolute numbers, the 40 million foreign-born denoted the highest total number of foreign-born residents in US history. Proportions as well as numbers of foreign-born sharply increased from 1970, when foreign-born residents comprised only 4.7% of the total US population.

Nativist anxiety coincided with immigration growth. Historically, fears of "others" have been traced to twin concerns related to economic prosperity and cultural identity. Cultural traditionalists historically have contended that American exceptionalism is grounded in an American distinctiveness that facilitates freedom and prosperity. Any threat to the existing culture is therefore viewed as a threat to these outcomes (Huntington 2004). Influxes of less-educated, lower-income migrants emigrating from totalitarian societies were viewed as a precursor to social conflict and national decline.

Around the turn of the twentieth century, Massachusetts Senator (1893–1924) Henry Cabot Lodge was a strong proponent of the view that immigration posed a threat to America's cultural and economic foundation. Lodge and a group of Harvard classmates organized the Immigration Restriction League (IRL) to promote literacy test requirements for immigrants. This requirement embodied a strategy aimed at keeping "undesirables" out of the country. After repeated attempts, the literacy test became law in 1917. In this year, Congress overrode a veto of the legislation by President Woodrow Wilson.

Lodge's anti-immigrant views were not universally embraced. The business community as well as industrialists such as Andrew Carnegie welcomed the ready supply of immigrant labor. Carnegie characterized immigration as a "golden stream" that contributed greatly to a highly successful form of industrial production. Labor organizations, however, supported immigration restriction. A steady stream of cheap, unskilled immigrant workers was viewed by leaders of the US labor movement as detrimental to their interests. The American Federation of Labor President Samuel Gompers himself, a Jewish immigrant from Great Britain, advocated total exclusion of the Chinese and selective restriction of Europeans (Zolberg 2006, pp. 217, 219).

Even the antitrust, Progressive Party Leader Theodore Roosevelt expressed reservations about immigration. In a 1918 speech in Des Moines, Iowa, Roosevelt pronounced that America was a nation, not a "polyglot boarding house." According to Roosevelt, in America there was no room for any 50–50 American (such as German-Americans or Irish Americans); there could be but one loyalty and that was to the Stars and Stripes. In his last public statement (read shortly before his death in 1919), Roosevelt asserted that if immigrants assimilate they should be treated as everyone else. This belief in nondiscrimination and equality for immigrants was fundamentally grounded upon the view that migrants must

become "American." Roosevelt concluded that in the United States there was room for only one language (the English language) and that the melting pot/crucible of America should turn out Americans, not transient dwellers in a foreign land.

Contemporary immigration rhetorically centered around various ideological cleavages, among them the dissimilarities between Anglo-Saxon, Latin, and Muslim belief systems. These fissures replicate the late nineteenth and early twentieth century anxieties. During this time period, migrations to the United States originated mostly from Southern and Eastern Europe. Nordic native-born Americans such as those in the Immigration Restriction League favored exclusion of these migrants or, at a minimum, some process for greater selectivity.

In 1921, immigration was dramatically curtailed by restricting the two-thirds of all immigrants that migrated from Southern and Eastern Europe. European immigration dropped dramatically by 1922. Many immigrant groups were affected by the xenophobic sentiment that prevailed at this time. Japanese immigration had been virtually eliminated by means of informal agreement (Gentlemen's Agreement of 1907) between the United States and the Empire of Japan. Under the terms of the Gentlemen's Agreement, Japan agreed not to issue passports for Japanese citizens wishing to work in the United States. The United States in turn agreed to accept the presence of Japanese immigrants already residing in America and to permit the immigration of wives, children, and parents. In 1920, further restrictive legislation was supported by President Warren Harding who was praised by the nativist Immigration Restriction League as the first American president who genuinely supported immigration restriction (p. 253).

## Economic and Cultural Concerns

Some empirical studies support the hypothesis that immigration tends to depress wages of native-born citizens, particularly those with less than a high school diploma (Borjas 1999, p. 14). Other studies question this conclusion while contending that the wage gap between high school dropouts and high school graduates has remained nearly constant since 1980, despite a large influx of less-educated immigrants (Card 2005).

In terms of earnings, data indicates that recent immigrants earned significantly less than native-born Americans and possessed lower skill levels than previous cohorts of émigrés (Borjas 1999, p. 21). In addition to the fear of depressing wages for the less educated, native-born Americans expressed concern that Hispanic immigrants would burden American citizens financially because of the need to increase government spending for law enforcement, education, welfare, and health care.

Economic concerns are supplemented with cultural anxiety over immigration. Divergent cultures are said to threaten core values regarding work, religion, sources of status, concept of time, and the significance of initiative, education, self-reliance, as well as ambition (Huntington 2004, p. 254). Huntington (2004) suggested that an influx of Third World immigrants could lead to a weakened adherence to the "American Creed" and a destabilization of the core values of equality, majority rule, rule of law, liberty, pragmatism, and equality of opportunity. Huntington concluded that in the contemporary world, the greatest threat to the societal security of nations emanated from immigration.

The contemporary fear of immigrants was aided by early eugenicists such as Madison Grant. Grant provided intellectual support for restricting immigration in his 1916 book, *The Passing of the Great Race*. In this treatise, Grant promoted the view that the expansion of non-Nordic residents would engender base behavior and eventually lead to the subjection of Nordics to inferior races. He contended that by abandoning cultural values, Nordics were about to commit racial suicide (Grant 1916). Spurred on by nativists, such as Grant, congressional legislation that severely restricted the flow of immigration was enacted.

## Congressional Legislation and Policy Prescriptions

Historically immigration has been managed through legislation or agreements between

sovereign nations. The Chinese Exclusion Acts of 1882, 1884, 1888, and 1892 effectively terminated Chinese immigration to the United States. The "Gentleman's Agreement" of 1907 between the United States and Japan restricted Japanese migration. The Immigration Act of 1917, Quota Act of 1921, and Immigration Act of 1924 severely limited the numbers of immigrant permitted to enter the United States. The legislation of the 1920s sought to encourage immigration from Northern European countries and discourage immigration from other locales. In 1924, more Italians, Czechs, Yugoslavs, Greeks, Lithuanians, Hungarians, Poles, Chinese, and Japanese actually left the United States than entered (Koven and Götzke 2010, p. 133). Fears of immigrants have been reignited in the early twenty-first century.

Contemporary politicians have exploited the immigration issue, perhaps none more so than Donald Trump. In a 2011 book, Trump outlined his plan to manage the immigration "crisis" (Trump 2011). Trump's plan called for (1) building a fence between the United States and Mexico, (2) deporting illegal immigrants, (3) eliminating the use of "cozy" immigration detention facilities, (4) opposing legislation that would establish a process for illegal immigrants to receive conditional residency and upon meeting certain conditions, receive permanent residency, and (5) terminate tuition benefits to undocumented immigrants.

In addition, Trump's plan proposed impounding payments derived from illegal immigrant wages, increasing fees on visas, imposing fees on border crossing cards, imposing fees on ports of entry to the United States from Mexico, tripling the number of US Immigration and Customs Enforcement (ICE) officers, implementing a nationwide e-verify system, returning all criminal aliens to their home countries, detaining all illegal aliens apprehended crossing the border until they are sent home, cutting off federal grants to any city which refuses to cooperate with federal law enforcement agents, subjecting individuals who refuse to leave at the time their visa expires to criminal penalties, allowing ICE officers to accompany local police departments in conducting raids of street gangs, banning immigration of Muslims, and ending birthright citizenship. Trump emphasized the need to look at Israel as a model for controlling borders by building a wall.

Trump also highlighted the need to improve wages and security for all Americans. These goals would be accomplished by increasing the prevailing salaries of foreign workers that were admitted to enter the United States as a consequence of their specialized knowledge and higher education. The intent of the proposed wage increase was to induce companies to give more jobs to the domestic pool of workers. The Trump plan would also tighten standards for the admission of refugees and asylum seekers.

Trump's plan differed from other proposed legislation (such as the Border Security, Economic Opportunity, and Immigration Modernization Act of 2013, also known as the Schumer-Rubio immigration bill) in a number of respects. Major differences between the Trump and Schumer-Rubio bill existed in regard to treatment of undocumented immigrants and immigrants with advanced skills. The Schumer-Rubio bill proposed to create a path to citizenship for undocumented immigrants already residing in the United States, provide more work permits for immigrants with advanced degrees in science, math, technology, or engineering (STEM), increase visas available for low-skilled workers, establish an agricultural worker program, and permit more hiring of immigrants by employers who demonstrate they cannot recruit US workers. The Schumer-Rubio bill did not advocate controversial features of Trump's proposals such as building a wall, making Mexico pay for the wall, ending anchor baby citizenship, deporting illegal aliens, and banning Muslim immigration.

The 2016 Republican Presidential Candidate Jeb Bush was highly critical of Trump's immigration proposals. In contrast to Trump, former Governor Bush proposed a clear path to legalization for large numbers of undocumented immigrants. Bush's plan included obtaining work permits, paying taxes, paying a small fine, and learning English. Federal benefits would be denied to undocumented immigrants prior to obtaining legal status. Bush castigated Trump's immigration ideas as unrealistic, costly, unconstitutional, a

violation of conservative principles, and likely to create unnecessary friction with a large trading partner. He noted that revoking birthright citizenship would require a change to the US Constitution, a process that was both politically difficult and time consuming.

In contrast to Bush's assertion that the United States does not bring in enough highly skilled immigrants, Trump lamented the fact the many US graduates with science, technology, engineering, and mathematics (STEM) degrees did not find jobs in those fields. He criticized Bush's immigration proposals as representing amnesty for lawbreakers.

## Assimilation or Restriction?

Former Harvard Professor Samuel Huntington proposed three specific strategies for managing immigration. Countries could respond to this threat by: (1) restricting immigration, (2) allowing immigration without assimilation, and (3) fostering immigration and assimilation (Huntington 2004, p. 181). According to Huntington, America was in danger of drifting into a culturally bifurcated Anglo-Hispanic society with two national languages. In addition, immigration was perceived as threatening political principles found in the American Creed, such as liberty, equality, democracy, individualism, human rights, the rule of law, and private property (p. 46). Huntington decried a foreign "culture of Catholicism" that was rooted in immigrant mistrust of people outside the family, lack of initiative, lack of self-reliance, low priority for education, and acceptance of poverty as a virtue necessary for entrance into heaven. These values were perceived by Huntington as un-American and threats to the nation's Protestant culture (p. 254).

Aside from restriction, Huntington's other nostrums addressed the issue of assimilation. Assimilation or "Americanizing" the immigrant was viewed by Huntington as a means to counter fading nationalism. Americanization is idealized by Huntington as a key element in American history. History in turn is seen as providing a guide for the future. For example, at the turn of the twentieth century, industrial corporations established schools at their factories to teach English and American values. Settlement houses, YMCAs, churches, and patriotic groups also sponsored programs. Instruction was provided in language, American history, civics, homemaking, personal hygiene, and vocational training (Koven and Götzke 2010, p. 10).

The Americanization movement that began with private organizations spread to local and state governments. Eventually the federal government as well as over 30 states passed laws establishing Americanization programs. Public schools were central to the effort to Americanize millions of immigrants who emigrated to the United States between 1890 and 1924. Reformers such as Horace Mann and John Dewey viewed education as the instrument to create a unified society out of the multitude of diversity created by immigration (Huntington 2004, p. 135). Progressives in general used education as the basic tool in an attempt to assimilate or Americanize the millions of immigrants to the United States. The Federal Bureau of Education also promoted Americanization efforts. In 1919, the Bureau urged the transformation of schools from places that existed exclusively as a dwelling for daytime learning of children into community centers with evening programs for the assimilation of adults (p. 135).

## Conclusions

Contemporary perceptions of the immigration crisis mimic earlier rhetoric. The language of today remains similar to that of the past; only the faces of the protagonists differ. In the 1920s, politicians and social elites railed against Bohemian/Czech, Jewish, and Italian immigrants. These immigrants were pejoratively characterized as undesirables (Zolberg 2006, p. 260). Today, politicians decry the flow of undocumented Mexican and Central American migrant as well as the intrusion of potentially dangerous Muslims.

The question of how to "manage" massive levels of immigration is not novel. Proposed solutions are not unique. Exploring America's past is

essential in answering the pressing question of how to manage the current immigration "crisis." A review of American history reveals a clear linkage between immigration and economics. In the early seventeenth century, representatives of the worker starved Virginia colony frequented taverns and markets of England in search of settlers (Koven and Götzke 2010, p. 124). As US industries grew in the late nineteenth century, America opened its doors to immigrants who flocked to America in search of employment. Foreign workers filled factories and mines in burgeoning automobile, steel, coal, tire, construction, and other industries. During World War II when massive numbers of Americans were fighting overseas, the United States imported workers by adopting the Bracero Program to employ Mexican nationals as agricultural and railroad laborers.

Economic contraction produced the opposite effect. Poor economic conditions were greeted with anxiety over wages and xenophobic resentment of the "other." In the 1920s, politicians passed legislation to restrict the entry of foreigners. Laws were successfully implemented and immigration was curtailed. The Quota and Immigration Acts of the 1920s effectively limited entry and is illustrative of one possible management strategy. A second strategy of assimilation was also pursued at the turn of the twentieth century. Assimilation, according to many scholars, represented a great American success story. Assimilation enabled America to grow and develop its economy with dedicated, energetic, ambitious, and talented people who became committed to America's Anglo-Protestant culture as well as the values of the American Creed (Huntington 2004, p. 203). Exclusion and cultural assimilation plans, however, are not without detractors. The concept of exclusion runs counter to the vision of America as a nation of immigrants. Assimilation raises the question of eradicating cultures, denying freedom of expression, and forcing ethnocentric views on others.

An alternative immigration strategy is that of adopting merit-based rather than family-based criteria for granting legal residency. Numerous advanced industrial countries have enacted point-based merit systems. Criteria such as education, work experience, and adoptability are heavily weighed under these systems (Koven and Götzke 2010, p. 200). The United States, however, remains committed to an immigration system largely based on some type of family relationship.

In contrast to US immigration policies, nations such as Argentina, Australia, Brazil, Canada, France, Germany, Greece, Hong Kong, India, Israel, Mexico, New Zealand, Nicaragua, Russia, Singapore, and the United Kingdom have all adopted skill-based policies for granting residency. The adoption of a point system with skill-based criteria has produced a different nationality mix of immigrants than the nationality mix of those nations such as the United States that prioritize family ties (p. 202). The adoption of a skill-based point system by the United States would likely starkly alter the national composition of US immigrants.

Immigration remains a challenge to American society. Some perceive this challenge as rising to the level of "crisis" with all the ominous implications. One should remember, however, that the United States has navigated the contours of large-scale immigration in the past and policy makers can learn from previous initiatives.

*Kaizen*; Lean; Plan-Do-Check-Act (PDCA); Total Quality Management (TQM)

### Brief Definition

Management practices: A set of practices to arrange actors and resources to improve organizational performance.

### Introduction

Local governments play a vital role in providing public services such as education, health, and basic infrastructure. However, the quantity and quality of public services are poor in developing countries (World Bank 2003). Understanding the barriers that impede efficient public service delivery and examining the methods to improve the public sector's effectiveness are critically important to secure citizens' basic human needs and to achieve the Sustainable Development Goals set forth by the United Nations. This section focuses on management practices as one potential driver to improve public service delivery and document their antecedents in the context of local governments in Bangladesh.

In a broad sense, public management can be classified as either *internal management* to stabilize internal operations of the system or *external management* (or *managerial networking*) to protect the organization from external shocks or to exploit external opportunities (O'Toole and Meier 1999, 2014). Both types of management matter. Walker and Andrews (2015), who conducted a comprehensive meta-analysis on the "management-performance" hypothesis, confirmed that public performance (especially the effectiveness of public services) can be improved through the internal management of strategy content (Andrews et al. 2012), planning (Boyne and Gould-Williams 2003), and staff quality (Pitts and Jarry 2009) and the external management of networking and collaboration with other stakeholders (Meier and O'Toole 2010).

If better public management brings about positive effects, what characteristics are associated with the adoption of these practices? For the internal management of strategic planning and process innovation, for example, the literature has identified various antecedents categorized by three aspects: (1) environmental factors such as political and public demands, media attention, participation in interorganizational relationships, and the size and growth of the population; (2) organizational factors such as organizational size, slack resources (e.g., time, budget, and ICT facilities), incentive systems, and the level of internal conflicts or required coordination; and (3) individual factors such as a manager's leadership abilities, cognitive style, position (tenure), employee autonomy, and job-related knowledge and skills (for a review, see Walker 2014; De Vries et al. 2015). External management or networking with other stakeholders is also affected by environments with diverse stakeholder demands, organizational structures and strategies, and managers' characteristics from past experience, educational background, position, perceptions, and specific managerial skills (Andrews et al. 2011).

The purpose of this section is to investigate the antecedents of the adoption of internal and external management practices in the public sector of Bangladesh. Bangladesh is a developing country in Southern Asia, where 25% of the population is

still living under the absolute poverty level (Government of Bangladesh [GOB] 2015a). Because public administration is in the process of devolution and experiencing many challenges, local administrative officers are confronted with a complex environment with great uncertainty (for details, see section "Structure of the Central and Local Governments"). This socioeconomic and political context makes public management even more important for the improved performance of public organizations (Andrews et al. 2011; O'Toole and Meier 2014).

This section's contribution is fourfold. First, a nationally representative survey on public management in Bangladesh was conducted, targeting 1,615 local offices in 202 subdistricts nationwide. A crucial limitation of the existing literature is that almost all of the studies referenced above depend on data from Western countries, which raises concerns about the external validity of these findings in their application to non-Western developing countries (De Vries et al. 2015). The original dataset sheds light on the differences and similarities in the antecedents of management practices between developed and developing countries.

Second, instead of focusing on a specific organization or service, this section covers eight departments that are in charge of the following standard public services: agriculture, education, health, and social support. Although previous studies on public management often focused on a specific organization, for example, public schools or hospitals, the context and environment should vary by sector (O'Toole and Meier 2014). The multi-sectoral scope can provide more general and robust findings common to various environmental settings.

Third, internal and external management are examined simultaneously. More precisely, this section classifies two types of management practices: *office management practices*, corresponding to internal management, which is related to cleaning, targeting, planning, standardization, monitoring, and improvement, and *collaborative management practices*, corresponding to external management, which facilitates collaboration with both public and private stakeholders. In contrast with many studies that address only internal or external management, this section's approach provides an opportunity to statistically test the hypothesis proposed by Agranoff and McGuire (2004), which proposes that the antecedents of internal and external management practices are different. ("The contacts, activities, policy tools, and other connections discovered in this study lead us to conclude that the capacities required to operate successfully in collaborative settings are different from the capacities needed to succeed at managing a single organization" (Agranoff and McGuire 2004, 175).)

Fourth, in addition to various possible antecedents, an officer's awareness of management techniques regarding "lean thinking," such as Plan-Do-Check-Act (PDCA), Total Quality Management (TQM), and *Kaizen* (i.e., the Japanese word for "continuous improvement") is included. (According to Radnor and Osborne (2013, 267), "Lean (also referred to as the Toyota Production System or TPS) originated within the Toyota Motor Corporation for the manufacturing of cars as a then radical alternative to the traditional method of mass production and batching principles for optimal efficiency, quality, speed and cost" and "seeks to 'design out' overburden (muri), inconsistency (mura) and waste (muda) in operational processes.") This section focuses on these techniques because such improvement methodologies have recently become part of a popular approach to public service reform in developed countries (Radnor and Osborne 2013) and have been identified as effective tools for the private sectors of developing countries to promote management practices and achieve profitable outcomes (Sonobe and Otsuka 2014). Moreover, awareness of management techniques can be manipulated more easily than other fixed antecedents such as organizational size and an officer's personality. If unawareness or informational constraints on management techniques are the primary obstacles to management practices, consultation and training can be effective, as shown by Bloom et al. (2013) with their randomized control trial in Indian textile firms.

This section finds that awareness of management techniques is positively correlated with both office (internal) and collaborative (external)

management practices. The correlation is sizable especially for practices related to internal process management such as making improvements, standardization, and for creating public-public partnership networks with other departments and local councils. On the other hand, almost all office resources, including budgets, staff, and materials, are *not* systematically associated with both management practices, contrary to the findings in the literature from Western developed countries.

The remainder of this section is organized as follows: section "Institutional Background" explains the context and institutional background; section "Data and methods" presents the data and methods; section "Results" reports the results; section "Discussion" discusses the findings; and section "Conclusion" concludes.

## Institutional Background

### Governmental Strategy for Improving Public Services

During the past 25 years, Bangladesh has achieved stable economic growth and rapid poverty reduction. The average gross domestic product (GDP) growth rate from 1990 to 2014 was 5.3%. Accordingly, the poverty ratio for citizens at the national poverty line (2,122 kcal/day) is estimated to have been substantially reduced from 56.7% in 1991 to 24.8% in 2015. Bangladesh is also achieving 17 of the 44 indicators of the Millennium Development Goals (MDGs) targeted for 2015 (GOB 2015a). Targets such as reducing poverty, increasing enrollment in primary schools, reducing infant and maternal mortality rates, improving immunization coverage, and reducing the incidence of communicable diseases were met. However, targets related to hunger, employment, quality of education, adult literacy, maternal health, and sanitation need greater attention.

To promote further socioeconomic development, the Bangladeshi government considers improving public services to be a priority. The Sixth Five-Year Plan (2011–2015) states, "Emphasis will be given to improving service delivery in basic services such as education, health, nutrition and water supply," and sets forth a strategy comprised of four pillars: (1) strengthening the civil service, (2) promoting devolution to local governments, (3) strengthening public-private partnerships (PPPs), and (4) strengthening planning and budgetary processes (GOB 2011, 32).

Regarding the first pillar, "strong training" is prescribed as a means to develop public administration capacity (GOB 2011, 32). Among public training institutions, the Bangladesh Public Administration Training Centre (BPATC) plays a central role in providing training for public officers. For example, all new entrants into the Bangladesh Civil Service (BCS) must take a 6-month Foundation Training Course wherein officers acquire general knowledge regarding administration as well as specific rules, regulations, processes, and procedures in public service delivery.

The second pillar, devolution to local governments, has long been a challenge. Although the Local Government Acts (Upazila Parishad Act of 1998, subsequent amendments in 2011, and the Union Parishad Act of 2009) were enacted to "transfer" 17 selected departments and the central government's BCS to the jurisdiction of local government institutions, functional integration remains incomplete (Rahman and Ahmed 2015).

The third and fourth pillars are countermeasures against weak administrative capacity in terms of human and budgetary resources. The Bangladeshi government has promoted PPPs, especially "collaboration with NGOs in the delivery of basic education, health and population management services" to support local administration (GOB 2011, 33). As a major initiative for improving planning and budgetary processes, the medium-term budgetary framework (MTBF) was introduced to all ministries in 2010. The MTBF addresses not only budget allocations but also information about mission statements, strategic objectives, priority spending areas, key performance indicators, recent achievements, and medium-term targets (GOB 2015b).

Although these four pillars are expected to improve public service delivery, it is unclear as to how they can be implemented in practice. What

type of "strong training" is needed to achieve the missions stated in the MTBF? How do public officers enhance collaboration with local governments and the private sector? Motivated by these questions, this study focuses on the knowledge of management techniques and the actual adoption of management practices in connection with all four pillars.

## Structure of the Central and Local Governments

Figure 1 indicates the structure of public administration in Bangladesh. For administrative purposes, the country is divided into 8 divisions with 64 districts, 489 subdistricts (*upazilas*), and 4,542 unions as of the end of fiscal year 2016. The structure of public service delivery in local areas is divided among the central and local governments.

The central government, headed by the prime minister, is comprised of the ministries and subordinate departments with headquarters in the capital city of Dhaka. Line departments under their respective line ministries, which are responsible for basic public services, have field offices in relevant divisions, districts, and subdistricts.

This section focuses on the subdistrict offices of the line departments. They represent the lowest tier of the departmental hierarchy and stand at the frontline of public service delivery. Subdistrict officers head subdistrict offices. They manage frontline staff and budgets under the supervision of district officers. Subdistrict officers have a certain degree of autonomy and discretion in managing implementation processes, from selecting beneficiaries to actually providing services (e.g., vaccinating livestock, managing school latrines, and disbursing allowances and pensions). However, because tasks, targets, and budgets are assigned in a top-down manner from the

**Management Practices in the Public Sector of Bangladesh, Fig. 1** Structure of Bangladeshi Public Administration (Note: *Ministry of Local Government, Rural Development and Cooperatives)

headquarters, subdistrict officers have a limited role in formulating policy.

To coordinate the line department field offices, the central government appoints and dispatches chief executives from the Cabinet Division in three tiers: Divisional Commissioners for divisions, Deputy Commissioners for districts, and *Upazila Nirbahi* Officers (UNOs) for subdistricts. At the subdistrict level, the UNO offices and the subdistrict offices of the line departments usually share buildings or sites. Thus, they work in close physical proximity. UNOs oversee various affairs, including coordinating and supporting the activities of the subdistrict offices. For example, UNOs hold regular coordination meetings to share information among the subdistrict officers of various line departments and to discuss interdepartmental issues.

The authority of the local government is divided among the following five institutions: district, subdistrict, and union councils are headed by chairpersons in rural areas, and city corporations and municipalities are headed by mayors in urban areas. In totality, approximately 60,000 councilors are elected by citizens. The central government regulates all of these institutions through the Local Government Division. At the subdistrict level, subdistrict (*upazila*) councils represent the local government. Subdistrict councils consist of one chairperson, two vice chairpersons (one seat is permanently reserved for a woman), and a union chairperson from each union in the subdistrict.

As mentioned above, subdistrict officers of the 17 line departments are supposed to be "transferred" to the subdistrict and union councils. However, because this devolution has not yet been realized, both councils face serious human and financial capacity constraints. Nevertheless, they have important functions for public service delivery in collaboration with the line departments of the central government. For example, union councils nominate beneficiaries for some social safety net programs (e.g., the Vulnerable Group Development Program for low-income women and the Gratuitous Relief Program for disaster victims) provided by the subdistrict offices of line departments (Rahman et al. 2011). Therefore, although the devolution of subdistrict offices has not been completely realized, in practice, subdistrict offices and local councils are collaborating closely.

## Data and Methods

### Analytical Framework

Figure 2 presents an analytical framework for public service delivery in the form of an input-process-output diagram. Inputs for public service delivery are human resources (staff), financial resources (office budgets), and material resources (facilities). Inputs are exogenous to subdistrict officers because they are allocated in a top-down manner.

Regarding the service delivery process, this section distinguishes two types of management practices. The first is *office management practices*, corresponding to internal management, which includes cleaning, targeting, planning, standardization, monitoring, and process improvements to effectively utilize the given resources. Although these practices are explained in detail in section "Data and Methods," these are essentially standard practices necessary for running a PDCA cycle.

The second type of management practice related to external management is *collaborative management practices*, i.e., collaboration with public and private stakeholders (e.g., UNOs, councils, nongovernmental organizations [NGOs] and citizens) outside the office to complement limited office resources. This practice is an important aspect of collaborative public management, defined as "a concept that describes the process of facilitating and operating in multi-organisational arrangements to solve problems that cannot be solved or easily solved by single organisations" (Agranoff and McGuire 2004, 4). In particular, NGOs are recognized as possible candidates to supplement the lack of government resources in delivering public services in Bangladesh (World Bank 2003).

### Survey Design

Data was collected under the "Project for Improving Public Services through Total Quality Management in Bangladesh". (This is an

**Management Practices in the Public Sector of Bangladesh, Fig. 2** Analytical framework: input-process-output diagram of public service delivery

official development assistance (ODA) project co-financed by the Japan International Cooperation Agency (JICA) and the Government of Bangladesh and was implemented by the BPATC.) The objective of the survey is to collect information about the current conditions in the adoption of management practices and in the outputs/outcomes of public services. Because of time and budget constraints, the survey limits its focus to eight departments: Livestock Services, Fisheries, Food, Social Services, Youth Development, Women's Affairs, Secondary and Higher Education, and Public Health Engineering. These departments are selected because they directly provide basic public services to citizens and have local offices in all subdistricts. Although they oversee different sectors and beneficiaries, their tasks and duties are quite similar: providing training, disbursing subsidies and allowances, providing microcredit programs, and setting standards and regulations.

The survey was conducted in 202 subdistricts, which amounts to 41% of the 487 total subdistricts in Bangladesh. The survey area was selected in two ways. First, all 64 district capitals (subdistricts known as *Sadar Upazilas*) were covered because these areas were the main target of the project. Second, 138 subdistricts other than district capitals were chosen randomly via stratified sampling in proportion to the number of subdistricts in each district.

Data were collected at the subdistrict offices for each department using a structured questionnaire for face-to-face interviews with subdistrict officers from April to June 2014. To ensure that they properly answered the questionnaire and in order to avoid non-response bias, the survey was authorized by the headquarters of target departments via official letters. Finally, the sample size was 1,615 offices, consisting of 8 departments in 202 subdistricts. (Although the sample size should be 1,616 offices (8 departments × 202 subdistricts), 1 office in the Department of Women's Affairs could not participate in the survey due to the officer's extended absence.)

The questionnaire is organized in two parts. The first part asks all departments common questions on the following topics in line with the analytical framework illustrated in Fig. 2: (1) human resources (staff), (2) financial resources (revenue budget), (3) material resources (facilities), (4) the officer's awareness of management techniques (e.g., TQM, PDCA, and *Kaizen*), (5) the officer's awareness of his/her and others' perceptions of the work environment, and (6) the adoption of management practices in the subdistrict office.

The second part seeks department-specific administrative statistics, aiming to collect information concerning outputs and outcomes of the public services delivered by each department. For example, the questionnaire asked subdistrict

officers of the Department of Livestock Services about the number of vaccinations for livestock and the number of training courses for farmers as outputs and about the production of milk, meat, and eggs as outcomes. Such items were constructed by using the statistics from the MTBF, which clarify departmental output and outcome indicators. The statistical items were reviewed and authorized by the headquarters of each department, which permitted each subdistrict office to register the data to plan and monitor their service delivery. Therefore, the response rate for the administrative statistics can be regarded as an objective indicator of the achievements related to planning and monitoring in that subdistrict office.

## Variables

### Outcome Variables

Main outcome variables are classified into two groups: (1) *office management practices* within subdistrict offices and (2) *collaborative management practices* involving external public and private stakeholders.

For office management practices, the section selected the following 14 practices, classified into 6 categories:

(i) Cleaning: (1) cleaning offices regularly and (2) filing and sorting office documents
(ii) Targeting: (3) setting measurable targets and (4) discussing them with staff
(iii) Planning: (5) planning time schedules, (6) personnel assignments, and (7) budget allocations
(iv) Standardization: (8) using guidelines or manuals and (9) using task lists
(v) Monitoring: (10) holding regular meetings, (11) reporting progress, and (12) communicating with citizens
(vi) Improvement: (13) proposing new plans or methods and (14) modifying methods to deliver services

These practices were selected after discussions with TQM experts and officials at the BPATC to fit the context of the subdistrict offices.

The survey asked officers whether they had adopted these 14 practices during the past 3 months and recorded responses as dummy variables (i.e., yes or no). Such closed-end questions to measure office management were also used in the Management and Organizational Practices Survey conducted by the US Census Bureau. Although this approach might be inferior in accuracy compared with open-ended questions, which were used in the World Management Survey, it incurs lower survey costs and registers higher response rates. Simple averages were calculated for the adoption rates of each of the six management categories as well as the rate for overall categories as the main outcome variable.

In addition to these self-reported subjective indicators, response rates were utilized for department-specific administrative statistics as objective indicators. The survey prepared approximately 30 items for each department that were supposedly monitored by subdistrict offices. Response rates were calculated as the ratio of items addressed to the total number of items.

As for collaborative management practices with other stakeholders, the survey asked about the frequency (days) of communication with public and private stakeholders during the past 30 days. The public stakeholders were UNOs (chief executives of the subdistricts), the district officers of the UNOs' line departments (i.e., a subdistrict officer's superior), subdistrict officers of other line departments, local councils of the subdistricts and unions, and respective staff members for reference. Private stakeholders included NGOs and citizens.

### Explanatory Variables

Regarding the key explanatory variables that may correlate with the adoption of management practices, the section focused on officers' awareness of management techniques and perceptions of their work environments and office resources. After consultation with project experts and officials at the BPATC, variables were designed to capture the current situation in the context of the Bangladeshi public sector.

To measure awareness of management techniques, the survey asked subdistrict officers

whether they knew the terms PDCA, TQM, and *Kaizen* on a three-point Likert scale (don't know, know something, or know well). Then a dummy variable denoting whether subdistrict officers knew well or knew something about all three techniques was constructed. This variable can be seen as a proxy for the knowledge of management.

To assess perceptions of self and others in the work environment, the survey asked 10 questions regarding satisfaction, motivation, confidence, leadership, busyness, need for improvement, trust in staff, reluctance of staff, recognition by the UNO, and recognition by the district officer. A five-point Likert scale of agreement (−2, strongly disagree; −1, disagree; 0, neutral; 1, agree; 2, strongly agree) was applied to each item listed in Panel B of Table 1.

Other controls include variables denoting office resources: human resources (number of staff members), financial resources (annual office budget), and material resources (office facilities and equipment such as shelves, computers, access to the Internet, and vehicles). Subdistrict officers' characteristics such as gender, age, education level, and salary are also included. To control for the geographical and socioeconomic characteristics of the subdistricts, this section used subdistrict dummy variables in the statistical estimation.

### Statistical Method

This section examined the association between the adoption of office and collaborative management practices as outcome variables and key explanatory variables using a descriptive analysis and multivariate regressions. For the descriptive analysis, unadjusted mean adoption rates of management practices based on the awareness of key management techniques are reported.

For multivariate regressions, this analysis estimates

$$y_{ijk} = \alpha + \beta \mathrm{AWARE}_{ijk} + X_{ijk}\gamma + D_j + U_k + \varepsilon_{ijk},$$

where $y_{ijk}$ is the outcome variable for the office and collaborative management practices of subdistrict office $i$ of department $j$ in subdistrict $k$. $\mathrm{AWARE}_{ijk}$ is the indicator of knowledge of the management techniques. $X_{ijk}$ is the vector of variables representing officers' perceptions and characteristics and other control variables capturing office resources. $D_j$ and $U_k$ are department and subdistrict fixed effects, respectively. Finally, $\varepsilon_{ijk}$ is the error term, and α, β, and γ are parameters to be estimated.

This model is estimated by ordinary least squares (OLS) with standard errors clustered by subdistrict. The model also includes survey team fixed effects to control for differences in the survey teams regarding the quality of interviews and data collection, which may particularly affect the response rate for administrative statistics.

## Results

### Summary Statistics

Table 1 reports the summary statistics of all variables.

Panel A summarizes the outcome variables. The adoption rates of office management techniques are relatively high. On average, across 1,615 offices, the overall adoption rate of all six categories is 82%. The adoption rate is highest for "cleaning" (96%), followed by "targeting" (95%), "planning" (87%), and "monitoring" (86%). Practices of "standardization" (69%) and "improvement" (62%) are less commonly adopted.

The response rate to key administrative statistics is 70% (SD = 21%). The difference in response rates is largely driven by variations among departments, ranging from 51% to 87%. The analysis includes department fixed effects in the regression analyses below to control for this.

Regarding collaborative management practices, the number of days spent communicating with stakeholders during the 30 days before the interview is 3.2 days (SD = 3.3) for office staff, 5.2 days (SD = 5.7) for UNOs and district officers, 4.1 days (SD = 5.1) for officers of other departments, 3.9 days (SD = 4.3) for local councils, 1.3 days (SD = 1.9) for NGOs, and 2.7 days (SD = 4.9) for citizens. The total number of days communicating with any of the above stakeholders is 20.6 days (SD = 20.3). Panel B summarizes the explanatory variables. Twenty-one

**Management Practices in the Public Sector of Bangladesh, Table 1** Summary statistics

| Variable | Definition | Mean | SD | Min | Max |
|---|---|---|---|---|---|
| **Panel A: Outcomes** | | | | | |
| **Office management practices** | Average implementation rate of management practices during the past three months. | | | | |
| Cleaning | (1) Office cleaning and (2) document filing | 0.96 | 0.17 | 0 | 1 |
| Targeting | (3) Setting office targets and (4) discussion of targets with staff | 0.95 | 0.18 | 0 | 1 |
| Planning | Planning (5) work schedules (6) personnel assignments and (7) office budgets | 0.87 | 0.21 | 0 | 1 |
| Standardization | Utilizing (8) guidelines/manuals and (9) task lists | 0.69 | 0.37 | 0 | 1 |
| Monitoring | (10) Conducting regular meetings with staff (11) reporting progress to the boss and (12) communication with citizens | 0.86 | 0.23 | 0 | 1 |
| Improvement | (13) Proposing of new plan/method and (14) modifiying of the way of service delivery | 0.62 | 0.42 | 0 | 1 |
| All practices | All office management practices | 0.82 | 0.16 | 0 | 1 |
| **Response rate to administrative statistics** | Average response rate to departmental questions about basic statistics for specific public services | 0.7 | 0.21 | 0 | 1 |
| **Collaborative management practices** | Number of days in contact with related stakeholders during the past 30 days. | | | | |
| Own staff | Staff of own office | 3.24 | 3.35 | 0 | 20 |
| UNO and district officer | UNO (chief executive of the subdistrict) and district officer | 5.24 | 5.72 | 0 | 30 |
| Officers of other departments | Other subdistrict officers in the same and other subdistricts | 4.09 | 5.11 | 0 | 30 |
| Local councils | Local councils (subdistrict and union councils) | 3.93 | 4.31 | 0 | 30 |
| NGO | NGO members | 1.28 | 1.88 | 0 | 20 |
| Citizens | Citizens | 2.73 | 4.89 | 0 | 20 |
| All stakeholders | All related stakeholders | 20.64 | 20.3 | 0 | 153 |
| **Panel B: Primary explanatory variables** | | | | | |
| **Awareness of management concepts (dummy)** | 1 if aware of all three management concepts (PDCA, TQM, and *Kaizen*) | 0.21 | dummy | 0 | 1 |
| **Officer's perception (5-point scale)** | (−2: strongly disagree, −1: disagree, 0: neutral, 1: agree, 2: strongly agree) | | | | |
| Satisfaction | Are you satisfied with your job these days? | 1.55 | 0.73 | −2 | 2 |
| Motivation | Are you well motivated to deliver quality services as a government official? | 1.41 | 0.9 | −2 | 2 |
| Confidence | Do you think you can accomplish your goals based on your own ideas? | 1.01 | 1.17 | −2 | 2 |
| Leadership | Do you think you can lead office staff to improve your service on your own initiative? | 1.53 | 0.78 | −2 | 2 |
| Busyness | Do you think you have too much work these days? | 1.08 | 1.1 | −2 | 2 |

**Management Practices in the Public Sector of Bangladesh, Table 1** (continued)

| Variable | Definition | Mean | SD | Min | Max |
|---|---|---|---|---|---|
| Need for Improvement | Do you think your office needs to improve public service delivery continuously? | 1.42 | 0.88 | −2 | 2 |
| Trust in office staff | Do you think most staff can be trusted in your office? | 1.2 | 0.97 | −2 | 2 |
| Reluctance of office staff | Do you think some staff is reluctant to improve public service in your office? | −0.96 | 1.23 | −2 | 2 |
| Recognition by UNO | Do you think your work is well recognized by the UNO? | 1.46 | 0.87 | −2 | 2 |
| Recognition by district officer | Do you think your work is well recognized by the district officer? | 1.5 | 0.86 | −2 | 2 |
| **Panel C: Controls** | | | | | |
| **Officer's characteristics** | | | | | |
| Female (dummy) | 1 if officer is female | 0.15 | dummy | 0 | 1 |
| Age | Officer's age | 45 | 8.2 | 20 | 70 |
| Masters or above (dummy) | 1 if officer holds a master's degree or above | 0.09 | dummy | 0 | 1 |
| Log salary | Officer's annual salary (log) | 9.68 | 0.35 | 7.18 | 11.41 |
| **Office resources** | | | | | |
| Log annual budget | Annual office budget (log, per staff) | 12.16 | 0.62 | 8.2 | 16.75 |
| Number of telephones & fax | Number of telephones and fax machines in the office (per staff) | 0.17 | 0.2 | 0 | 2.5 |
| Number of PCs & printers | Number of PCs and printers in the office (per staff) | 0.28 | 0.26 | 0 | 4 |
| Internet access (dummy) | 1 if the office has Internet access | 0.74 | dummy | 0 | 1 |
| Number of shelves | Number of shelves in the office (per staff) | 0.57 | 0.45 | 0 | 6.38 |
| Number of vehicles | Number of vehicles (bicycles and motorcycles) in the office (per staff) | 0.24 | 0.3 | 0 | 5 |
| Number of office staff | Number of office staff | 7.05 | 3.55 | 0 | 20 |
| Average age of office staff | Average age of office staff | 43.42 | 4.51 | 24.65 | 64.5 |

Note: N = 1,615 for all variables. UNO: *Upazila Nirbahi* Officers; NGO: non-governmental organization; PDCA: Plan-Do-Check-Act; TQM: Total Quality Management.

percent of the officers are aware (knew at least something) about all three management techniques (PDCA, TQM, and *Kaizen*). Figure 3 shows the level awareness by technique.

Regarding officers' perceptions, the average scores from the five-point Likert scale (a higher score means higher agreement) are as follows: 4.6 (SD = 0.7) for "satisfaction," 4.4 (SD = 0.9) for "motivation," 4.0 (SD = 1.2) for "confidence," 4.5 (SD = 0.8) for "leadership," 4.1 (SD = 1.1) for "busyness," 4.4 (SD = 0.9) for "needs for improvement," 4.2 (SD = 1.0) for "trust in office staff," 2.0 (SD = 1.2) for "reluctance of office staff," 4.5 (SD = 0.9) for "recognition by UNO," and 4.5 (SD = 0.9) for "recognition by district officer."

Panel C of Table 1 summarizes other control variables denoting officer characteristics and office resources.

## Descriptive Results

Table 2 provides information concerning unconditional outcome variables based on the awareness of key management techniques. Adoption rates of office management practices are higher for aware offices than for unaware offices in all six categories. Differences in adoption rates range from 1.1 percentage points (cleaning) to 10.3 percentage points (improvement). Similarly, the response rate for key administrative statistics is higher for aware offices: 72.8% (aware) versus 69.3% (unaware). However, the unconditional indicators of collaborative management practices are not significantly different. In fact, on average, aware offices spent fewer days than unaware offices collaborating with office staff, supervisors, NGOs, and citizens.

## Main Regression Results

Table 3 presents multivariate regression estimates for the adoption of office management practices. Column (1) reports estimates for the average adoption rates of overall practices. Columns (2) through (7) present results for each category. Column (8) regresses response rates.

Table 3 shows that awareness correlates positively with adoption and response rates. Column (1) indicates that the average adoption rate for overall practices among aware offices was significantly higher, by 3.8 percentage points, compared with unaware offices, or 4.5% higher compared with the unadjusted mean for unaware offices (81.5%). The breakdown of the results by management category in Columns (2) through (7) reveals that the adoption rate is higher for aware offices than unaware offices in all management categories except "cleaning" (0.3 percentage points lower, −0.3% compared with the unadjusted mean for unaware offices). The coefficient is significantly higher in the categories

| **Collaborative management practices** | | | | | | |
| Own staff | 3.237 | 3.174 | 3.254 | −0.080 | [−0.435, 0.276] | 0.660 |
| UNO and district officer | 5.245 | 5.035 | 5.302 | −0.267 | [−0.888, 0.355] | 0.400 |
| Officers of other departments | 4.092 | 4.194 | 4.064 | 0.130 | [−0.444, 0.705] | 0.656 |
| Local councils | 3.931 | 4.217 | 3.853 | 0.365 | [−0.189, 0.919] | 0.197 |
| NGO | 1.276 | 1.258 | 1.281 | −0.023 | [−0.244, 0.198] | 0.837 |
| Citizens | 2.731 | 2.513 | 2.790 | −0.277 | [−0.817, 0.263] | 0.314 |
| All stakeholders | 20.641 | 20.539 | 20.669 | −0.130 | [−2.438, 2.178] | 0.912 |

Note: 'Aware' refers to offices that 'know well' or 'know something' about all three techniques: PDCA, TQM and *Kaizen*. The 'Difference' column reports the difference between the two groups. *P*-values of Welch's *t*-test are reported in the last column for each outcome. Those below 0.05 are emphasised in bold letters. UNO: *Upazila Nirbahi* Officers; NGO: non-governmental organisation; PDCA: Plan-Do-Check-Act; TQM: Total Quality Management.

"planning" (4.7 percentage points, +5.4%), "standardization" (6.0 percentage points, +8.8%), and improvement (6.5 percentage points, +10.8%). Coefficients for "targeting" and "monitoring" are both positive but not significant. Column (8) indicates a higher response rate to administrative statistics by aware offices, although the estimate is insignificant.

The correlation between officers' perceptions and adoption of practices is unclear and inconsistent; signs of the coefficients are mixed across management categories. However, the coefficient for "trust in office staff" is significantly negative, and the coefficient for "reluctance of office staff" is significantly positive for all practices. This result is driven by a relatively large coefficient for "improvement." Any other consistent associations between any other officer characteristic and office resource are not observed.

Table 4 reports the estimates for collaborative management practices. Column (1) regresses the days spent collaborating with a stakeholder. Columns (2) through (7) report the results for collaboration with each stakeholder.

Note: Dependent variables are the adoption rates for office management practices and response rates for administrative information. Fourteen activities relating to office management practices are aggregated into six categories and the total (for the details, see Table 1). Department, subdistrict and survey team fixed effects are included but not reported. Standard errors clustered by subdistrict are in parentheses. *** $p < 0.001$, ** $p < 0.01$, * $p < 0.05$. UNO: *Upazila Nirbahi* Officers; NGO: non-governmental organisation; PDCA: Plan-Do-Check-Act; TQM: Total Quality Management.

Column (1) shows that, on average, aware offices spend 3.2 more days with stakeholders during the previous 30 days than do unaware offices. Columns (2) through (7) indicate that the correlation between awareness and collaboration is sizable and positive for all stakeholders; the effect is significant for local councils (0.8 days) and officers of other departments (0.8 days).

Regarding officers' perceptions, again, Table 4 shows no sizable or consistent pattern of correlation. However, the analysis does find a positive correlation between busyness and collaboration, which is significant for collaboration with citizens (0.6 days). Regarding officers' characteristics, officers holding a master's degree or above are less likely to collaborate. Although the coefficient is insignificant except for collaboration with officers of other departments, it was sizable for all stakeholders (−3.9 days). For office resources, there is no clear, sizable, and consistent correlation observed except for the positive effect of Internet access, although it is insignificant with the exception of collaboration with citizens.

## Discussion

The main statistical findings can be summarized as follows. First, the adoption rate of office management practices overall is high (82%), but the adoption rates of practices related to "standardization" (69%) and "improvement" (62%) are relatively uncommon compared with those related to "cleaning," "targeting," "planning," and "monitoring." This finding indicates that the "Plan" process of the PDCA cycle is relatively well implemented, but the "Do," "Check," and "Action" processes need further improvement. Additionally, the average response rate of 71% to administrative statistics is disappointing. The statistics are fundamental and necessary for setting targets and monitoring the progress of each department's main tasks. It is therefore unsurprising that nearly 40% of the offices have not adopted "improvement" practices.

Second, awareness of key management techniques is positively correlated with the adoption of both office and collaborative management practices. The difference is sizable, with the adoption rates of "improvement" and "standardization" for aware offices exceeding those for unaware offices by 10.8% and 8.8%, respectively. This finding is consistent with the literature, which emphasizes the importance of knowledge and learning to improve public service processes and performance (Walker 2014). The result also supports the evidence provided by Indian textile firms that one potential reason why firms in developing countries do not adopt productive operational management practices is that they are simply unaware of such practices (Bloom et al. 2013). Bloom et al. (2013) found that it is easy to overcome this information constraint by merely explaining the existence of these practices, which eventually leads to rapid adoption. This suggests that unawareness is a key barrier to the implementation of such practices and that relatively simple interventions that provide information about management practices and best practices may boost adoption in the public sector as well. With regard to the hypothesis that antecedents are different between internal and external management (Agranoff and McGuire 2004), the results imply that awareness of management techniques is positively related to both.

Third, officers who trust their staff members are less likely to adopt office management practices, whereas those who think that their staff members are reluctant tend to adopt more practices. A natural interpretation of this behavior is that office management practices are substitutes for trust or good relationships; officers adopt these practices because they cannot trust their staff or if the staff members are reluctant. These effects are significant and sizable, especially in the adoption of improvement practices, which implies that subdistrict officers tend to modify the method of public service delivery when their staff are reluctant and maintain the same method of public service delivery when staff members are trustworthy. This function of public management to maintain organizational discipline may be evidenced in developing countries where the absenteeism of public workers is typically widespread.

Fourth, office resources are not associated with both office and collaborative management

UNO: *Upazila Nirbahi* Officers; NGO: non-governmental organisation; PDCA: Plan-Do-Check-Act; TQM: Total Quality Management.

practices. This result is not consistent with the standard view that slack resources contribute to the adoption of management practices (O'Toole and Meier 2014). However, this is unsurprising, given that the practices on which we focused did not necessarily rely on physical or financial resources. The exception is the positive correlation between Internet access and collaboration with citizens, which may suggest the importance of information infrastructure in facilitating public relations.

Overall, the findings imply room for improvement in the "Do," "Check," and "Act" processes in the PDCA cycle. In particular, the constant update of fundamental administrative statistics is necessary to set objective targets and monitor progress. To move forward in this respect, the results suggest that simple interventions to raise awareness about management techniques may be effective in improving the adoption of management practices.

The obvious limitation of this study is that the findings are merely associations based on cross-sectional data. Further, careful investigation is necessary to establish causal links. Another important limitation is that the survey has disregarded the broader question of whether the adoption of management practices is associated with effective, efficient, and fair public service delivery in the context of developing countries. Addressing that issue is beyond the scope of this section because the survey was unsuccessful in collecting performance data. Regarding the technical aspects, measurements for management practices in this section may be less accurate than the measures constructed from the now-standard method of the World Management Survey, which uses open-ended questions. It may be considered that simple, discrete closed-ended questions regarding specific and objective management practices are reliable at least for capturing qualitative information about their adoption, which is relatively obvious and distinct.

## Conclusion

This section found that the awareness of management techniques such as PDCA, TQM, and *Kaizen* is positively correlated with the adoption of office management practices, especially those related to planning, standardization, and improvement. In addition, a positive correlation for collaboration with stakeholders was observed.

A possible overall interpretation of the results is that the lack of knowledge of basic management techniques may be an obstacle to the adoption of management practices. Offering a simple training course about concrete methods and practices may be effective in improving the adoption of management practices.

# Management Science in the Public Sector

Kevin P. Kearns
Graduate School of Public and International Affairs, University of Pittsburgh, Pittsburgh, PA, USA

## Synonyms

Decision analysis; Industrial engineering; Operations research; Scientific management

## Definition

Management science is an interdisciplinary field that develops and applies a wide variety of analytical concepts and tools to help decision-makers address complex challenges in organizations. Management science uses data and modeling to help decision-makers structure a problem within prescribed parameters to reach an envisioned goal, usually optimization of a desirable outcome like cost-effectiveness or minimization of an undesirable outcome like risk or loss.

## Introduction

Management science draws on fields such as mathematics, statistics, decision theory, econometrics, operations research, game theory, industrial engineering, and systems theory, to name a few. This field has such extensive overlap with the field of operations research that the two are considered nearly synonymous. In fact, in the mid-1990s, the Operations Research Society of America merged with the Institute of Management Sciences to form the Institute for Operations Research and the Management Sciences (INFORMS).

Conceivably, we could trace the roots of management science all the way back to the ancient Romans, Egyptians, and Chinese. But for practical purposes modern management science has its roots in the industrial engineering and process improvement efforts that helped fuel the industrial revolution. Frederick Taylor's famous time and motion studies and other studies (Taylor 1914) were a precursor to modern methods of optimizing assembly processes, and in Taylor's work, one can even see traces of total quality management (TQM) and other process improvement techniques that came into favor in the 1970s and 1980s.

It was not until World War II, however, that management science began to take the general form that we know today. The public sector, particularly the military, provided an essential catalyst for the development of ever more complex applications of management science such as optimizing bombing strategies in World War II, the design of resource deployment by Robert McNamara's "whiz kids" during the Vietnam conflict, and present-day logistics management

techniques to support US troops in the Middle East and elsewhere.

## General Applications of Management Science

Management science has been used principally in two ways. First, **modeling** helps management scientists build representations or simulations of real-world phenomena such as production processes or performance thresholds of products or services. The purpose of modeling is to replicate as closely as possible the phenomenon in question, allowing decision-makers to experiment with different assumptions in a laboratory-like environment by changing the parameters of key variables or components of the model. The purpose of modeling is to test and predict various outcomes under different assumed circumstances. Predicting the spread of a disease is one prominent example of modeling that is used in the field of public health. Modeling also is used as a tool in the research and development phase of products or services or to construct hypothetical scenarios based on data.

Second, management science is also used to construct **decision support tools and systems** that can be used to help organizations optimize or minimize certain outcomes. One example is designing an optimal troop deployment strategy and providing just the right amount of logistical support for the cost-effective implementation of that strategy. Other frequently used applications are in supply chain management, inventory control, and transportation logistics. Decision support systems can also be used to design regulators of complex systems that automatically trigger when certain conditions are detected. For example, banks and credit card companies detect fraud or identity theft when certain purchase patterns do not conform to the behavioral norms established in the modeling process. Also, security and intelligence agencies cull mountains of data from myriad sources using network analysis and other tools to detect anomalies associated with security threats such as terrorist attacks.

## Selected Applications in the Public Sector

While military applications may be most obvious, there are many other public sector applications of management science that, in some instances, have improved efficiency or even reinvented the delivery of public goods and services at all levels of government. A comprehensive list of all management science applications is well beyond our scope here but some of the more prominent examples are briefly described below.

### Project Management

In addition to the day-to-day delivery of public goods and services, public sector organizations often undertake discrete projects that are bounded in time and space. Examples include the design and implementation of new information systems or other operational infrastructure, the development and implementation of new or modified programs and services, the production of technical specifications for new construction or other procurement, and many other projects that can be bounded within prespecified parameters. The success of these projects depends, in part, on the careful sequencing of multiple steps and the well-timed delivery of required components and equipment along the way. Even moderately complex projects demand careful planning and coordination of activities inside and outside of the organization. Poorly sequenced or ill-timed delivery of key components can result in huge cost overruns and, in the longer term, might jeopardize the quality and effectiveness of the end product.

Management science methodologies such as program (or project) evaluation and review technique (PERT) have been used for many years to help project managers identify and map the many required activities and deliverables in any given project (Archibald 1987; Lu and AbouRizk 2000). The result is not a linear string of project steps but rather a complex network of activities, some of which require a particular sequence while others can be completed in parallel to each other. Once the network of activities is mapped, probability and risk analysis can be used to identify the most optimistic, least optimistic, and most likely

schedule of activities and the costs associated with each. Most importantly, PERT reveals a project's so-called critical path which is composed of the activities that are the true drivers of the completion schedule with obvious implications for cost overruns and other negative outcomes. Any effort by the project manager to speed up the project will need to focus on the activities that are located along the critical path. Speeding up activities that are not on the critical path will have no effect on project completion date.

PERT and its various offspring have been applied in a wide variety of projects in public and nonprofit organization including flow analysis in hospital emergency care, urban planning and construction projects, infrastructure maintenance and replacement, design and operationalization of military hardware, and many others.

Project management in government is complicated by a variety of demands that do not plague the private sector. For example, public sector projects often involve multiple agencies or different levels of government – federal, state, and local. This results in a much larger and more diverse array of constituents to whom project managers are accountable, more laws and regulations governing procurement and subcontracting, and more requirements for interagency coordination in the public sector. All of these factors must be accounted for in PERT analysis. Failure to do so is one important cause of frequent delays and cost overruns in large public sector projects.

## Supply Chain Management

Supply chain management involves the application of management science methods to control the flow of goods and services from their origin to their consumption or use by consumers. It generally involves not only movement of these goods and services but their temporary storage in inventory. Thus, supply chain management includes related methods of inventory management, including specific financial ratios that provide a barometer of how well an organization is managing its inventory.

Supply chains can involve a number of semi-autonomous external suppliers as is the case, for example, with various types of food production, processing, inspection, and transportation. Another example is the assembly and movement of government aid either internationally or domestically, such as getting food, clean water, and building materials to areas devastated by natural disasters. Alternatively, the supply chain can be internal to a single organization such as the Internal Revenue Service developing a supply chain model for processing tax returns from citizens.

Supply chain operations reference (SCOR) is a method for documenting a supply chain's processes and activities (Poluha 2007). Like its cousin PERT, SCOR can be used to assess supply chain performance and reveal opportunities for improvement in processing, movement, storage, or quality. Supply chain management also draws upon queuing theory, systems theory, as well as operations research methods like Monte Carlo simulations to optimize the location of various storage and transfer facilities. Among the many applications of queuing theory are air traffic control and toll booth management.

In the public sector, supply chain management is much more susceptible to high risks, especially in areas like military operations, food inspection, water purification, air traffic control, criminal justice records and procedures, emergency response systems, foreign aid, and many other government functions that require a flow of goods and services from one point to another. For example, at the time of this writing, public officials in Michigan are engaged in efforts to correct the damage done by switching the supply of Flint's water from Lake Huron to the Flint River. It has been discovered that water from the river is highly corrosive, thus damaging the City's waterlines and leading to unhealthy levels of lead in the water consumed by residents. Initiated as a cost-saving measure, the supply chain strategy may have disastrous public health consequences, particularly for children.

In certain instances, we have seen alarming gaps in the government's ability to effectively manage supply chains. For example, it's generally recognized that Walmart outperformed the Federal Emergency Management Agency (FEMA) in managing the flow of supplies and goods to

communities devastated by Hurricane Katrina. Supply chain management is at the heart of Walmart's business model, and therefore, that company is exceptionally good at it.

Another complication when applying supply chain management in government is that only tangible goods can be temporarily stored in inventory. Thus, the supply chain of *intangible* government services cannot benefit from the management science methods of optimizing inventory management. Even a "tangible" service such as firefighting provides an example of the limitations of supply chain management in government. In a sense, firefighting services *are* inventoried while personnel and equipment wait in firehouses until the alarm signals the need to deliver their services to the "consumer." The inventory costs of firefighting are a huge drain on municipal budgets, yet attempting to manage these inventory costs may be perceived as diminishing the readiness of this lifesaving service, thus placing elected officials at political risk from citizens and employee unions.

Supply chain management in the public sector has become both more important and more difficult as governments at all levels rely more on outsourcing programs and services rather than providing them directly. More than half of the federal budget is used for the purchase of goods and services from the private sector, whether businesses or nonprofits. Tracking the supply chains of thousands of contractors and subcontractors is a tall order, but often is mandated by regulations governing environmental protection, labor safety, international trade, international security, and so on. The globalization of the economy also complicates supply chain management in both the private and public sectors. Finally, there is the issue of how to hold a bewildering number of suppliers accountable to the public for the quality and performance of their services while also holding public officials accountable for fairness, finances, and ethical behavior. Kearns (1996), Behn (2001), and Romzek and Johnston (2005) among others have proposed frameworks for monitoring accountability in service delivery networks that include a mixture of actors and motives.

## Public–Private Partnerships

A relatively new form of outsourcing is the so-called public–private partnership (PPP). In one version of the PPP, the government "owner" leases a tangible asset, like a bridge or a toll road, to a private firm to manage and maintain for a prescribed period of time. In this case, the initial financing and construction was undertaken by the government entity, so the PPP is essentially a transfer of maintenance and management responsibilities to the private sector partner. In another form, the private firm actually assumes all responsibilities from the start including design, financing, construction, and management of the facility.

In many instances the cost of the service provided by the PPP is borne only by actual users, such as travelers on toll roads or consumers of clean water. Using management science methods like risk analysis, supply chain analysis, and econometric forecasting, government "owners" of these assets reason that they can be more effectively and efficiently managed by a private firm with specialized skills.

Like supply chain management, the advent of public–private partnerships reflects the growing trend (in both business and government organizations) to focus on core competencies while abandoning the self-contained, vertically integrated operational models of traditional government service provision. In addition, a PPP can help a government entity avoid additional debt obligations in, for example, large construction or rehabilitation projects.

But PPPs are not without their challenges. For example, accurate risk assessment, under conditions of extreme uncertainty, is an essential prerequisite for a successful PPP. A challenge to effective negotiations and management of these complex PPPs is that the two principal partners – the government "owner" and the private sector "leaser" – may apply different, and not fully compatible, risk criteria (Grimsey and Lewis 2002).

In addition to their technical complexity and risk, some critiques of PPPs emanate from the core philosophy that the delivery of certain public

goods should never be outsourced to private firms. This is the traditional notion – not without merit – that roads, bridges, dams, and other large infrastructure assets are the exemplars of a "public good" in the most traditional definition of that term. The fear is that a for-profit firm, with a cost-containment philosophy, might be tempted to jeopardize safety or concern for future generations in its quest for short-term profit maximization.

## A Broader View of Management Science

Our discussion to this point has focused on the technical aspects and examples of management science in government. We'll conclude this entry by briefly examining a broader view of the management sciences in government.

In the early 1990s, a new philosophy of government service began to emerge that came to be known as "New Public Management." The publication of Reinventing Government (Osborne and Gaebler 1992) followed by the report of Vice President Gore's National Public Review (Gore 1993) catalyzed the widespread adoption of a variety of public management techniques such as decentralizing and disaggregating bureaucratic functions, greater and more sophisticated use of outsourcing, introduction of competitive and market-based mechanisms, development of social enterprise models for diversifying revenue, more pervasive use performance management systems, and the reconceptualization of citizens as "customers." Soon these entrepreneurial ideas and business management models spread to the private nonprofit sector. In the philosophy of "social entrepreneurship," charitable foundations and individual donors were reconceived as investors, and the concept of venture philanthropy paralleled the model spearheaded by venture capitalists in the private sector (Letts et al. 1997). Nonprofits themselves were urged to be more entrepreneurial by leveraging their core assets and capabilities into profit-making subsidiary businesses that are either embodied in or adjunct to the core mission (Dees et al. 2001).

Various mechanisms and tools of NPM have been critiqued from both practical and theoretical perspectives (Terry 1998; Hood and Peters 2004; Dunn and Miller 2007). It has been suggested that entrepreneurial public management emphasizes risk taking, lack of transparency, and separates professional managers from the elected officials and citizens to whom they are accountable. Ultimately, the increasing use of outsourcing may produce a "hallow state" that is devoid of service delivery capacity and political legitimacy, "where a government . . . has chosen to contract all of its production capability to third parties, perhaps retaining only a systems integration function that is responsible for negotiating, monitoring, and evaluating contracts" (Milward and Provan 2000, p. 362). Moreover, it has been suggested that the concept of citizens as "customers" devalues and demeans the democratic notion of citizenship with all of its many responsibilities as well as privileges. For example, citizens are often called upon to support, politically and financially, services that they never actually consume but which are essential for the betterment of society as a whole. A colleague once critiqued NPM for producing what he called "vending machine government" wherein citizens pay only for what they consume and, in the process, feel justified in denying responsibility for the many roles and functions of a democratic government that have nothing to do with consumption, efficiency, or entrepreneurial management.

## Summation

Management science can be technically confined to an array of models and techniques designed to optimize (or minimize) selected outcomes under known or assumed constraints. In this narrow interpretation, management science has become an important tool in the design of specific functions and processes in all types of complex organizations, including many government and nonprofit entities. Interpreted more broadly as the application of business management

techniques in the public sector, management science generates heated debates regarding its intended and unintended consequences.

# Management Strategies and Budgetary Politics

George E. Hale
Kutztown University of Pennsylvania, Kutztown, PA, USA

## Synonyms

Executive strategy and resource allocation; Organizational policy and public financial management

## Introduction

Management strategies are a central feature of budgetary politics. Yet no single strategy guides the deployment of public funds. Public agencies often adopt management strategies to align or fit with their economic and political environments, but there are risks. Strategies can work in certain contexts, but fail to achieve results in others. For example, the management approaches well suited to an era of incremental, year-by-year expansion of government funding do not work well when agencies face the need for deep spending cutbacks. Simply put, the engine driving agency budgets cannot easily be thrown into reverse. In short, there is no one best way to manage government agencies and budgets.

While the budget literature largely focuses on strategies and tactics employed to acquire resources, less is known about how management strategies are adapted to different environments in order to produce results. However, it is the results of programs that are ultimately most important,

and it is the role of management strategy to consistently produce results by keeping organizations on time and on budget. One management theorist (Daft 2000) defines management strategy as "the general plan of action by which an organization intends to achieve its objectives." While it is not feasible to definitively link-specific strategies with organizational success, it is possible to identify patterns where management strategies are adapted to certain environments.

Management strategies evolve in response to the opportunities and constraints presented by different contexts. Daft (2000) identifies three basic strategies – growth, stability, and retrenchment. When examining management strategies and public budgetary politics, it is possible to expand upon on these generic strategies. Management strategies can respond to at least six different conditions ranging from favorable to extremely unfavorable: rapid growth, incremental growth, stability, cutbacks, poverty, and environmental uncertainty. As a result, there is significant variance in the management strategies adopted. The choice of strategy influences the potential for goal achievement. It can also enhance or compromise the potential for acquiring additional resources. Since what works in one context may fail in another, executives are making important decisions when they decide on strategy.

## Management Strategies

### Rapid Growth

The rapid growth of public programs sounds too good to be true for program advocates. Yet it can also produce challenges and carry big risks. In the private sector, rapidly expanding companies often fail by running out of cash while ramping up their inventory. In the public sphere, accelerated growth gives rise to other risks. At times it can lead to failure in accomplishing the mission. Expanding agencies are often unable to hire people, award contracts, develop training programs, or secure equipment as fast as necessary. Complex governmental rules, regulations, and procedures can inhibit the speedy deployment of resources. It is as if water simply backs up behind a dam. While repaid expansion of governmental programs is not the norm, neither is it rare. The creation of new agencies such as NASA or EPA in the 1960s or the Transportation Security Administration recently or the mobilization of troops to fight wars in Iraq and Afghanistan provides examples of situations with extreme pressures to produce results immediately.

Challenged by rapid growth, executives often employ distinctive management strategies. One is to partner with other organizations to short-circuit the administrative hurdles that hinder expansion. A partnership or contracting-out strategy can include different levels of government, other agencies, nonprofits, or private firms. For example, the expansion of federal domestic spending during the Great Society years relied heavily on over 500 different intergovernmental programs to carry out federal priorities. Additionally, faced with the challenge of fighting of two wars in the Middle East, recently, the Department of Defense repeatedly supplemented active duty forces with National Guard units. Moreover, the national response to the 9–11 attacks expanded our intelligence agencies and produced explosive increases in the number of private contractors working for the CIA, NSA, and other related agencies. Until the capacity is built to handle big tasks, it makes sense to partner with entities with the capacity to produce results or with organizations that are more nimble.

Sometimes executives rapidly expand programs within a larger and more stable organization. In these cases, they may adopt a directed management strategy of "robbing Peter to pay Paul" or reprogramming funds. For instance, frustrated by the lack of urgency within the bureaucracy, Defense Secretary Robert Gates (Gates 2014) found it necessary to accelerate the development of Mine-Resistant, Ambush-Protected Vehicles (MRAPs) to protect American troops from improvised explosive devices in Iraq. While he ultimately secured supplemental appropriations for the program, initially Gates reprogrammed or moved funds from other programs to MRAP development by giving it a legal priority over the other military systems. This resulted in the first major military procurement

program moving from decision to full production in less than a year for the first time since World War II.

Periods of rapid expansion eventually end as growth tapers off. Sooner or later organizations adjust to modest growth and compete for needed resources. During this deceleration phase management, strategies need to be adjusted to become sustainable. When government programs face the prospect of the modest year-by-year spending increases of incremental budgeting, different management strategies are often called for.

### Incremental Growth

Budgeting in an environment that gave rise to incremental budget growth was often the norm in post-World War II America. As a result, the strategies used to campaign for expanded budgets occupy a central role in budgetary politics (Rubin 2014; Wildavsky 1975). Often these strategies involve tailoring budget justifications to meet the preferences of legislators. For example, the techniques for budgetary expansion include a long list tactics such as the "camel's nose in the tent," that is, starting a program with a small base of funding. At other times, funding depends on making programs look inexpensive by understanding costs, by spreading start-up costs over several years, or by obtaining funding from multiple sources. In these cases, budgetary advocacy is closely linked to management strategies based on starting small and expanding slowly.

Other incremental management strategies can enhance funding over time. One such strategy is to locate programs or facilities in many geographic locations in order to construct large coalitions of legislative supporters. For example, starting with J. Edgar Hoover, the FBI has decentralized its top management. The key actors reporting to the director are the special agents in charge of the 56 strategically placed field offices located in major cities throughout the nation. Similarly, many federal agencies rely on decentralization when they use their own administratively determined formulas to set aside grant funds for each state or region in order to build geographically broad support.

Other organizations adopt management strategies to facilitate incremental growth by avoiding competition with other agencies. Creating government-owned enterprises, public authorities, special purpose governments, or special districts reflect management strategies that insulate activities from competition with other entities for resources (Rubin 2014). Additionally, earmarked revenues or trust funds can provide stable funding and predictable flows of revenues that promote longer-term planning. For example, highway trust funds secured by motor fuel taxes allow state transportation departments to develop and implement multiyear capital improvement plans. These long-term plans also become lobbying tools once lawmakers grasp that the entire program needs to be funded on schedule if their favored projects are to be funded without delay.

Yet not every agency aggressively desires to expand its budget. Some management strategies stress stability over the opportunity to maximize their budgets.

### Stability

Management strategies do not always aim at increasing budgets. For instance, when it is important to integrate operations and improve efficiency, it may make sense to center a management strategy on stability after a period of rapid growth. Alternatively, stability also may reflect an ongoing management approach instead of a temporary phase of consolidation.

Some agencies adopt management strategies designed to preserve autonomy at the price of sacrificing resources. Wilson (1989, 190, 191) notes that agencies may "avoid taking on tasks that differ significantly from those that are at the heart of the organization's mission" or those resulting in "divided or hostile constituencies." For instance, under J. Edgar Hoover, the FBI for many years resisted taking over responsibility for investigating drug trafficking and organized crime. Hoover preferred to focus on crimes that were easier to solve and carried less risk of organizational failure. Furthermore, not every agency seeks to grow its budget. A significant number prefer to avoid risk and controversy. One study of federal reorganization plans found in ten of

twenty-five cases agencies actively resisted opportunities to grow.

Additionally, organizations dominated by a single profession often rely on stable management strategies based on professional norms. For example, highway engineers often prioritize "fast, safe, and efficient" projects that increase traffic circulation over projects reflecting other priorities such as neighborhood streets, preservation, and quality of life issues. Similarly, in the past, many public libraries gave priority to being repositories of quality, standard works valued by upper and middle class readers over the recreational reading habits of lower-income patrons. While these approaches are less common today, management strategies focused on stability evolve slowly in response to changes in the professional education and socialization.

### Cutbacks

When the budgetary environment turns negative, executives must adopt new management strategies often called "cutback management" (Behn 1980; Levine 1978). If the pressure to cut is a temporary response to brief slowdown in the economy, officials can adopt short-term budget reduction measures such as across-the-board cuts, hiring freezes, or raids on reserve accounts. These short-term measures may suffice and do little harm if the economy rebounds quickly. If the required retrenchment is long term and deep, these expediencies can compound the long-term problem since they eventually inflate the price tag associated with items such as deferred maintenance, skipped pension payments, or new debt instruments.

If cutbacks need to be large and continuing, a new management strategy makes sense. The challenge is not just to shrink an organization but also to ensure that it remains effective. Cutback management cannot simply rely on cutting the fat in the budget. Although decentralization is typical when resources are growing, a centralized plan is needed for cutback management to work. Organizational units cannot be counted on to volunteer to take the hits associated with cutbacks. Chief executives must identify and choose among difficult alternatives. To sustain performance, a cutback management strategy must reflect a wide range of issues such as focusing on the core mission, terminating or reducing weak or ineffective programs, renegotiating contracts, shedding surplus property, and securing employee sacrifices. Executive decision-making alone is not enough. Behn (1980, 619–620) writes, "Leadership for cutback management involves establishing the inevitably of resource decline, dramatizing the opportunity costs of not cutting-back, and creating a new corporate strategy to match the new realities so as to make acceptance of retrenchment possible."

After cutback management moves an organization to a lower resource level, it may be necessary to adopt another management approach. Sometimes organizations will cut back to levels consistent with long-term stability. Conversely, other organizations must adjust to conditions amounting to poverty.

### Poverty

When every year the cost of providing public services grows faster than revenues, a public agency's milieu is "poor and certain" (Wildavsky 1975). Such a condition exists in many cities. City officials know that what they will have to spend will not keep pace with the cost of providing the services currently offered. For them the big issue is creating ways to recapture funds that are currently budgeted. New programs or expansions are out of the question. This poverty prompts executives to adopt a distinctive set of management strategies.

One management strategy is to tightly control spending to create a modest surplus as a hedge or cushion against unexpected developments. Wildavsky labels this strategy as "revenue budgeting." Since the budget must be balanced, revenues control spending. Tight control over spending, arbitrary decision-rules to deny spending requests, and a strong "no money" premise are used to hold spending down. Denying all requests for new positions, imposing across-the-board reductions, and freezing vacant positions are constant features of "revenue budgeting." In this context, budgeting is not based on citizen demands; it is preoccupied with limited funds. For city managers, mayors, and budget directors, the purpose

of revenue budgeting is not resource allocation or reallocation. Instead this management strategy focuses on staying afloat, meeting the next payroll, paying vendors at the last possible moment, and ending the year with a modest surplus.

Poverty gives rise to other management strategies. When organizing public services, cities face two options. They can use public workers, facilities, and equipment to produce services. Alternatively, they can purchase services from private companies or other governments (Savas 2005). A contracting-out strategy provides potential advantages such as access to economies of scale, reduced labor costs, and lower prices through competition. While any organization may take this route, for some it is not really an option. Less than 40% of all cities rely on only their own municipal employees for service delivery related to public works. Moreover, when cities provide social services, approximately 75% use employees from private agencies or firms. The widespread adoption of contracting-out strategies reflects cost advantages. While savings don't always result from contracting-out if competition is limited, the economies can be substantial. One survey of 100 cities found savings of 20% in public works, 17% in health and human services, and 16% in support services (Stein 2003).

Other management strategies for coping with poverty include more radical steps such as privatization of services through the sale or long-term lease of public assets. For example, while the majority of Americans obtain their water from publicly owned and operated utilities, private companies serve over 70 million Americans. A range of options consistent with a privatization strategy include purchasing services, contracting for operations, arranging for private design, construction and operation of new facilities, or the sale of a public facility. Another variation on this approach is divestiture by transferring programs to another governmental unit as when some cities merge public libraries and parks with countywide systems.

Nonetheless, there are some conditions worse than certainty and poverty. For example, uncertainty abounds when conditions reflect runaway inflation or collapsing revenues. In these highly uncertain environments, the greatest challenge is to identify any workable management strategy.

### Uncertainty

Some budgetary environments lack the predictability we typically expect to find. Caiden and Wildavsky (1980) argue that intense uncertainty is common in underdeveloped or poor countries. Uncertainty also arises in developed nations under conditions of hyperinflation or rapidly deteriorating revenues such as occurred during the recent Great Recession. Under conditions of uncertainty, officials not only do not know what will happen next, they also don't know where things currently stand.

When reality changes daily, when revenues collapse, when costs explode, and when financial reports are suspect, normal management strategies go out the window. These conditions give rise to "repetitive budgeting," where budgeting is a continuous process struggling to hit a moving target. Before budgets are completed, the baseline assumptions are out-of-date. Budgets are constantly made and revised; they are never finished. When repetitive budgeting takes place, central budget and finance officers respond by lowering revenue estimates as a hedge to create a buffer or surplus. They also exert control over the release of funds so that each disbursement is potentially subject to renegotiation with the line agencies of government.

Conventional management strategies are difficult to employ under these conditions. Organizations increase their lobbying in an effort to obtain funds. They may also look for other sources of money to keep funds outside the scope of central reviewers. They hide resources. They also typically narrow their time horizons by ignoring long-term planning and capital investment. Their need to keep options open frustrates the development of a coherent long-term management strategy.

## Conclusion

Management strategies often are responses to changing conditions. Well-crafted strategies can help organizations accomplish their goals and

compete for resources. Furthermore, some strategies are more likely to be effective in some situations than others. For instance, short-term budget-cutting strategies appropriate for a temporary or modest downturn may compound problems if cutback management is needed for the long term. Conversely, few are likely to make the sacrifices needed for cutback management unless they expect a permanent contraction in the resources. Additionally, some management strategies may be effective in more than one circumstance. For example, a contracting-out management strategy is frequently used for rapid program expansions as well as for cost reductions under conditions of poverty.

Since there is no one best way to manage, executives must carefully consider their options and learn from experience. In periods of rapid growth or uncertainty, it may be imperative to quickly find workable strategies. Another challenge is to be able to switch management strategies as budgetary politics and environments change. For example, periods of rapid growth never last long, and during deceleration phase, new management strategies may be necessary. Similarly, over the last several decades, many governments have faced the need to move from incremental budgeting to cutback management. It is essential that budgetary politics and management strategies be closely linked to environmental constraints. To succeed public executives must be able to acquire needed resources. However, obtaining funding is not enough. Sound management strategies appropriately matching the situation are also essential for achieving results that matter.

# Management Versus Leadership

Berry Tholen
Institute for Management Research, Department of Public Administration, Radboud University, Nijmegen, The Netherlands

## Introduction

Within the leadership literature and the management literature, two different but more or less mirroring advocacies can be discerned. On the one hand, there is advocacy for true leadership, namely, a form of leadership that expresses emotion and passion and not cool rationality, which is characterized by creativity and the fostering of innovation instead of routine, and that understands quality and value and goes beyond concerns for effectiveness and efficiency. This true type of leadership is contrasted with "mere management" (e.g., Zaleznik 1977; Murray 2010). On the other hand, there is a broad management literature that favors a rational type of management. This literature ranks knowledge higher than intuition and what feels best; it puts proven approaches and predictability over chance and risky trials, and it values problem-solving capacity over soul-searching. Management, in this line, is contrasted with irrational forms of steering and organizing (e.g., Beer 1967; Taylor 1911). Both of these advocacies use the same conceptual dichotomies but with quite different valuations.

These two mirroring advocacies can be found in the field of Business, but also in Public Administration literature. In his *Politics as a Vocation*, Max Weber, for instance, comments on the German politicians of his day for not being real leaders but mere managers. They did not have the passion, vision, and authenticity that characterize the true leader; instead, they expressed risk aversion and grayness. These "Beamtennaturen" (civil servant/manager types) blocked change for the good in Germany (Weber 1948). On the other side of the ocean, at about the same time, Wilson and Goodnow argued that city management, and public administration in general, should be protected from the intrusion of political leaders. Public management should have the character of "semi-scientific expertise" (Goodnow 1974; Wilson 1966).

In the following sections, four issues will be addressed:

- What is meant by rational management, and what are the main concerns of the advocates of this ideal?
- What is meant by true leadership, and what is allegedly wrong with "mere management"?
- What is the relation between these two advocacy types?
- What comments can be provided to the management-leadership opposition?

This chapter focuses on understandings of leadership and management. Its subject is this conceptual dichotomy and its use in literature. This chapter does not address the empirical study of the actual relations (cooperative or conflicting) between the management level and leadership level in public or private organizations.

There is, as the examples of Weber and Wilson above illustrate, an overlap between the theme of this chapter and the administration-politics dichotomy in Public Administration literature. The latter, however, to a large extent, is concerned with another issue: the position of appointed and neutral civil servants versus elected and partisan politicians. This chapter will address only aspects of the administration-policy debate that are relevant and inextricably related to the management versus leadership issue.

## The Advocacy for Rational Management

Advocates of the science and expertise of management typically note the costs and losses that are the consequences of less informed ways of organizing and steering. These advocates maintain that all kinds of work processes and decision making become more efficient and effective when we can decide on them and organize them rationally. The true manager is a modern professional.

The managing professional has acquired knowledge and particular methods to arrive at sound decisions. This means that he is able to distinguish factors that are of importance for the problem that he is facing, knows how to measure relevant variables, and can identify the options he or she has and their consequences. He knows how to make decisions that are well informed, logical, and oriented to realizing goals at minimal costs (Simon 1967).

Since the early days of this managerial approach, its advocates differ regarding what a rational or scientific type of organizational management actually entails. According to some, it is the maximal division of labor, protocol and procedures, and control. This is, for instance, the case in Taylor's "Scientific approach to management" (Taylor 1911). In more recent years, others have opted for the integration of functions, flexibility, and individual responsibility as the most rational form of managing organizations (e.g., Beer 1967; Murray 2010). What they all have in common, however, is that tested procedures built on robust empirical knowledge regarding what works best is attainable and should be used maximally to achieve the best results.

In the advocacy for rational management, several underlying motives can be distinguished. A primary concern is about actually realizing desired and desirable outcomes. Advocates of rational management in business want to make sure that scarce and costly resources are used effectively and efficiently. The future of firms and corporations depends on it. Rational managers abhor amateurism and unreflective approaches for this reason (e.g., Beer 1967). In public management, the advocates of the rational approach criticize unanalyzed policies and merely

symbolic policy making for a similar reason: resources are not, or at least not optimally, used to address societal problems (e.g., Simon 1967). The emphasis that some have given to evidence-based policy making fits this rational perspective of public management very well.

This first managerial concern, in fact, expresses the Enlightenment ideal. This ideal wants to leave the mythical stage behind and approach the world in a scientific way. It wants to proceed not by relying on some authority or established practice but by autonomous critical thinking (e.g., Kant 2015).

A second concern is closely related to the first one but is not identical to it: predictability. Employing the type of rationality that has become dominant in modernity according to Weber – goal rationality or instrumental rationality – typically helps to make our surrounding world more predictable. We can control natural phenomena (at least far more than in earlier days), and we can control the phenomena in social and organizational settings. Because of the use that is made of managerial knowledge, we know what to expect (Weber 1978).

The realization of effectiveness and reliability can be hindered on three levels. On the individual or psychological level, a lack of discipline or ignorance can be identified as the cause. On the organizational level, irrationality might be part of an organizational culture that is strongly tradition or identity-based (conventional or affectual in Weber's terms). Explanations can also be provided on the sociological or cultural level. The lack of managerial rationalism is then linked to the lack of development of Enlightenment values. Society, or certain areas in it, might still be dominated by irrational thinking and not yet be guided by the ideas of modernity (Weber 1978).

## The Advocacy for True Leadership

The literature on leadership typically presents lists of contrasting characteristics of the true leader versus the mere manager. The leader follows his heart and is involved, authentic, and enthusiastic. The leader focuses on goals and on what is of value. His main interest is not the organizational machinery but the good that it can, and should, accomplish. He focuses on people and not on systems and structures. The leader stands for trust, not control, and for innovation, creativity, spontaneity, and surprise (see, for instance, Certo 1997; Hull and Ozeroff 2004; Kotter 1990; Kotterman 2006; Murray 2010; Yukl 1989; for lists of lists see Algahtani 2014 and Lopez 2014). In this literature, the leader typically is pictured in terms that make the manager look dull and gray.

In the older literature, to be sure, true (political) leadership has also been distinguished from its aberrations. In Erasmus, for example, a typical expression of the mediaeval concern can be found: a true leader should fight selfish vices such as pride and strive for personal glory (Erasmus 1963). Another example is Machiavelli's typical concern for realistic leadership over naïve utopianism (Machiavelli 1989). True leadership, as Weber and contemporary writers envision it, however, is not opposed to selfishness or naivety but to management. There might be something good in managerial knowledge and skills, and there is a certain attraction in managing and being a manager, but it is not in management that the true leader should excel. Put even more strongly, managing is something that a true leader steers clear of.

Different types of reasons are given for the looming threat of managerialism. The first type focuses on the individual level. Research findings are cited that suggest that people favor managerial skills as opposed to leadership skills because they assume that managing is easier than leading (Kotterman 2006). At the organizational level, an inherent conservatism, inertia, and risk-aversion is noted; organizations, like machines, tend to be path dependent (Zaleznick 1977). A third type of diagnosis identifies a typical trait of modernity: the ever-intensifying focus on instrumental rationality. All spheres of human life have come under the spell of a way of thinking that values logic and efficiency and drives out concerns for substantial values, myths, and emotions. This tendency can be found not only in production processes but also, for instance, in

the arts, education, or politics. The bureaucratization of institutions and the rise of the rational manager as a dominant type are manifestations of this development (Habermas 1984; MacIntyre 1985; Weber 2011).

Why is managerialism a threat, and why is true leadership of importance? One answer typically given in the Business literature is that corporations and firms need innovation, flexibility, passionate leadership, and the like to flourish. Organizations, especially commercial organizations, have to address dynamic, competitive environments. The status-quo orientation of mere managerialism cannot offer organizations the *esprit* that they need to constantly renew themselves and prosper (Murray 2010).

A second type of argument for true leadership emphasizes the downsides of modernity, especially the consequences of a spreading instrumental rationality. This rationalism brings us routines and fixed procedures that lead to "iron cages" and a "petrification" of organizational life (Weber 2011). All aspects of our life world become colonized by this way of instrumental thinking (Habermas 1984). The focus on effectiveness and efficiency drives out our concern and appreciation for the intrinsic values and qualities of all kinds of social practices in education, arts, politics, etc. (MacIntyre 1985). To remedy this growing dominance of modern rational thought, some emphasize the value of the Romantic side of modernism: emotions, passion, and authenticity (Ch. Taylor 1989). Others opt for a revival of premodern perspectives as an alternative: intrinsic qualities of common practices and individual development (MacIntyre 1985). The true leader is able to stimulate individuals and organizations to break free from petrified relations and work processes by his charisma and passionate enthusiasm (Weber 1948, 2011). He typically has the virtues that make him put intrinsic values first and enable him to make social practices flourish (MacIntyre 1985).

## Relation Between the Two Advocacies

The advocacies for true leadership and real management differ, but they clearly share the same dichotomies. At least the following distinctions can be found (comp. Algahtani 2014; Kotterman 2006):

- The rational versus the emotional. The manager typically is analytical, calculating, professional, detached, and employs expert knowledge. The leader follows his heart and is involved, authentic, and enthusiastic.
- Instrumental rationality versus value rationality. The manager knows how to get results, and he knows what works. He focuses on making procedures effective. The leader focuses on goals and on what is of value. He focuses on people and not on systems and structures.
- Stabilizing versus innovating. The manager typically is concerned with controlling, certifying, and making things predictable. The leader stands for trust instead of control and for innovation, creativity, spontaneity, and surprise. While the manager is risk averse, the leader takes risks. The leader is less concerned with the short term than the long term.

An important difference between the advocacies in the use of these dichotomies is their different valuation (and framing) of the items. What is creativity and innovation for one side, for instance, means insecurity and unpredictability for the other; what is focusing on realizing goals for one side is a one-sided fixation on means and efficiency for the other.

The overview in the two sections above illustrates that these dichotomies are applied at several levels. Sometimes the opposition between manager and leader is presented at the individual level and concerns different personality traits or different orientations within one person. Sometimes the focus is on particular roles in an organization: the managerial role and the leadership role. In still other cases, the dichotomy is presented in a characterization of the societal culture. In all these cases, however, the advocates on both sides argue that one side has come to dominate the other – a development that is threatening something valuable and that, therefore, should be reversed. The point, however, is not that the other side is completely wrong and should be eradicated. The message is that a better balance should be struck (At the organizational level, see,

for instance, Algahtani 2014 and Kotter 1990. At the societal level, see MacIntyre 1985. For both, see Weber 1948, 2011).

The agonistic relation between true leadership and proper management takes as its setting modernity, and organizational life therein more particularly. It can, however, be linked to a much older one. Leadership versus management might be understood as a manifestation of the classical relation between pathos and logos or the *Dionysian* and the *Apollonian* (comp. Nietzsche 1995).

## Critical Observations

The dichotomy on which the opposition between management' and leadership builds might be vulnerable to two types of comments: an empirical comment and a conceptual one.

Advocates in the debate over management versus leadership criticize one another for depreciating certain values they themselves think important. Critics lament, for instance, the lack of appreciation for managerial values in comments regarding "managerialism" (e.g., Du Gay 2000; Terry 2003). However, while both sides make strong claims about the effects that their preferred approaches have, these empirical claims are hardly ever contested in this literature. The large body of existing research on, for instance, individual traits and leadership effectiveness, the effects of routines and regulated processes, and leadership styles and their effect, is hardly ever referred to in this debate, nor is the dichotomy refined by using research findings about the effects of certain approaches in different situations, branches, or sectors. The question, therefore, remains open regarding whether the claims made in the debate by either side will survive empirical scrutiny.

Additionally, on a conceptual level, the dichotomies can be challenged. Within not only psychology but also epistemology and ethics, the distinction between the rational and the emotional has been questioned (e.g., Morton 2010; Nussbaum 2001). Similar doubts have been raised regarding the distinction between (neutral) instruments and (desirable and valuable) aims (e.g., Svara 1998). The idea of a dichotomy without a third approach has been questioned more fundamentally in the opposition between instrumental rationality and value rationality, for instance, by Habermas. He introduced the notions of practical rationality and especially communicative rationality to overcome this dichotomy (Habermas 1984).

## Conclusion

The debate regarding management versus leadership is a debate about which values deserve emancipation in individual orientation, organizational life, or society at large. Advocates from both sides tend to put the values they favor in a positive light and frame the opposing values in a less favorable way. The ultimate goal of both sides is not to eradicate the other but to strike a better balance between the opposing perspectives. The opponents basically differ on their diagnosis of the state of the world and on what is now most needed.

# Managerial Functions in the Public Sector

Alan Lawton and Julie Rayner
Federation University Australia, Gippsland Campus, Churchill, VIC, Australia

## Synonyms

Administrative; Executive; Management; Professional; Purposes; Roles; Tasks

## Introduction

The managerial functions in the public sector are many and varied and this chapter maps their terrain. In so doing, it addresses a number of key questions: First, what are these managerial functions and have they changed over time? Second, what skills are required by public sector managers to carry out these functions? Third, are the functions and skills unique to the public sector? In seeking to answer these questions, it is suggested that managerial functions will be conditional upon organizational structures, on community expectations of public managers, and on the political direction that public servants are given by their political leaders.

Throughout the discussion, the term public managers is used to refer to those appointed civil servants and local government officers who are responsible for overseeing the delivery of public services whether they are in education, healthcare, social welfare, policing, defense, economic development, or waste disposal. The term public managers should be distinguished from public service professionals such as teachers, social workers, clinicians, or police officers. It is recognized that many of these professionals are, increasingly, taking on managerial functions, and this is discussed below.

Management is also distinguished from leadership as it is generally considered that management is concerned with planning; budgeting; measuring and managing performance, people, and change; and ensuring the day-to-day running of the organization. In itself, management is a complex, difficult, and essential task. Leadership is considered to be about taking an organization into the future, having a vision, leading, and inspiring rather than managing people. Leadership can be found throughout the organization, not only at the top and is not just exercised by the politicians. Both leadership and management are essential, and, as suggested below, leadership is required from more and more people. At the same time, effective leadership might be comparatively rare and an important consideration is how to assess the performance of both leadership and management. Not only that but in seeking to improve and develop leadership skills, there is a continuing debate about whether effective leaders are born rather than made.

## Organizational Structures

Managerial functions should be inextricably linked to the organizational structures within which they are carried out. In Max Weber's (1978) classical bureaucracy, characterized by hierarchy, task specialization, objectivity, neutrality, and universality, functions will be clearly delineated at different levels within the organization. Roles are well defined and rule-following is important, and expected, and determined in advance, and there is no variation. If a public manager occupies a specific position within the hierarchy, say middle management, then certain expectations will come with the role. Similar functions will be carried out whether in health, social services, or the environment. The classic functions of management were established by Henri Fayol (1916) and involve the activities of planning, organizing, coordinating, communicating, and controlling. In the public sector, discretion will be limited and the exercise of autonomous decision-making will be discouraged. Under traditional public administration, there is a clear division between the formulation of public policy by politicians and the implementation of policy by public managers. There is a sharp distinction between the public and private lives of public managers and public service is delivered by full-time careerists who have undergone professional training.

Of course, it is now argued that classical bureaucracy was an ideal type, and if it ever existed in practice, then its days are long gone, even though features of it will remain in particular services. In child protection agencies, for example, it is expected that due account is taken of legislation, protocols, and procedures and that accountability is paramount. In welfare services, it is anticipated that principles of fairness and objectivity ensure that like cases are treated alike, whereas in leisure services or economic development, some innovation and discretion might be allowed. While politicians, business, and the public in general might denigrate bureaucracy and "red tape," at the same time citizens demand to be treated fairly and equally. As such, it is recognized that bureaucratic procedure and "red tape" contribute to such outcomes.

In contrast to managing through bureaucracy, managing through the market, both internal and external, involves competition and choice emphasizing performance and outcomes rather than throughputs or outputs. There will be a focus on results; the managerial function will be to achieve performance targets through the economic and efficient use of public resources. Financial performance will be closely monitored and citizens will be treated as customers.

While several public services are now delivered in a competitive environment, for example, leisure, waste disposal, and some aspects of health and education, many public services are delivered through partnerships with the private and not-for-profit sectors. Here managerial functions will involve the specification and monitoring of contracts, negotiating with a range of external stakeholders and ensuring that performance requirements are met. External deliverers will be held to account and expected to meet predetermined performance targets. Contracts will be either renewed or terminated subject to legal requirements and legislation.

The organizational structures required to manage the public services through either markets or partnerships are likely to be flatter and will require the manager to look outward toward other organizations rather than up and down the internal hierarchy. Under these circumstances, the public managers have more discretion and will allow the "managers to manage." The downside of this is that traditional accountability through the hierarchy may be weakened and the democratic legitimacy of decisions could be undermined. Thus, it could be asked if policy is being made by the public manager operating under conditions of discretion, what role is there for the politician? Is there a trade-off to be made between democracy and the, perhaps, quicker, more flexible and more innovative delivery of public services?

Such questions are difficult to answer and the best way to respond may be to treat the delivery of public services, not as a homogenous whole, but on a case-by-case basis. Hence, in the area of child protection, society may want public managers to follow the rules, not to take any risks, to be closely monitored, and to be held accountable by their line managers through hierarchical arrangements. In contrast, where the state is involved in economic development, some element of risk-taking,

innovation, or experimentation might be considered acceptable. However, even here we would expect due consideration of key principles of public service including transparency and accountability.

## Managerial Skills

Management of all types is, invariably, the management of relationships as much as it is the management of tasks. This is particularly the case in much of the public sector which is, after all, predominantly part of the service sector. The public sector provides services in the form of education, health, social care, and so on. Historically, relationships were internal to the bureaucracy and essentially hierarchical – implementing the policies set by those above and supervising the delivery by those below. Professionals within the public sector such as social workers, doctors, and teachers had relationships with clients, patients, and students outside of the sector. Public officials had, in many cases, to deal with those external to the organization through those professionals. The education officer would work through the teachers and the health administrator through the medical professions.

In a more complex public sector working with and through other bodies, both public and private, particularly with the ever-increasing use of outsourcing, these relationships become increasingly varied and ambiguous. Public managers at all levels will have relationships with a range of different stakeholders including partners, citizens, clients, customers, politicians, regulators, and so on. In an ambiguous and fragmented public sector, the public official will need to develop skills of listening, negotiating, persuading, transforming, and leadership.

Under coproduction, public officials are expected to engage with, rather than deliver to, a whole host of community groups. Coproduction is derived from the community and not the market, and therefore, the official has to find new ways of engaging with the citizen (Denhardt and Denhardt 2015). In the past the ballot box could be taken as expressing the will of the people. However, in those countries where voting is not compulsory, it has declined steadily at election time, particularly in local elections.

The changing requirements and skills of public officials can be seen in just about any job advert for a senior public official around the world. A recent job advertisement (February 2016) for a senior government position in the Northern Territories of Australia is clear about the kind of person that it is looking for:

- Are you an innovative leader passionate about supporting businesses to start, run, and grow?
- An exciting leadership opportunity to deliver economic benefits for the NT through strong engagement with the business community.
- You understand commercial imperatives with a proven track record in achieving results in a dynamic environment and a commitment to strengthen services to regional and remote areas.
- You are driven by a client-centered approach that realizes the importance of a culture of service collaboration.
- The successful candidate will be an active member of the executive team committed to driving the right environment for business, industry, and workers.

This particular job advert is for an executive director business, but the language of innovation, passion, leadership, delivery, engagement, achievement, commitment, client-centered, and a team player are found increasingly across the public services.

What is proposed is that new ideal types of public managers should be recognized, and these new types take various forms and will include:

1. The deliverer – public managers still have to manage people, performance, tasks, and budgets. Under New Public Management (NPM) of the 1990s, managers were expected to be given the "freedom to manage." They still have to ensure the day-to-day delivery of public services.
2. The policy-maker – in practice, public managers have always influenced policy. Street-level bureaucrats have exercised discretion in the implementation of policies in this way influencing policy on the ground. Senior managers have

shaped policy in the options that they have offered politicians and the advice given on the practicalities of different policy choices.

3. The negotiator – public managers sit at the heart of a web of relationships both internal and external to their organizations. These relationships will be both formal and informal and require soft skills of listening, nurturing, and facilitating and hard skills of contract supervision and compliance, performance accountability, and conflict mediation.
4. The steward – ensuring the protection, and continuity, of the public interest through fairness and consistency in the application of rules and the law.
5. The implementer – in states where there is a high degree of central government control, managers will need to align local initiatives with central government targets and implement central government policy.
6. The democrat – public managers are accountable to citizens, users, consumers, and customers of public services. Participation in the democratic process by diverse groups takes different forms, and public managers will need to find ways of legitimizing public services by engaging with such groups in the coproduction of public services.

Public managers are expected to move between these different roles constantly and to respond to the demanding expectations of multiple stakeholders in a multicultural environment.

The notion of the hybrid manager has also been used to describe the crossover between managerial roles and professional roles. For example, as doctors and clinicians have to manage their own budgets or to operate under resource constraints, professional expertise will be supplemented by managerial skills. Hence, they are all managers now, in some form or another, whether they like it or not.

## The Distinctiveness of Public Sector Management

A key consideration is the extent to which management is the same irrespective of the type of organization, the government, or the industry sector the organization is in or whether the organization is classified as public, private, voluntary, third sector, or a hybrid. Under the rhetoric of NPM, it was argued that the public sector needs a good dose of the skills thought common among private sector managers. Certainly, governments in many countries subscribed to the view that the perceived ills of the public sector – inefficiency, waste, red tape, the lack of innovation, flexibility, and dynamism – could be cured by the importation of private sector managers and their skills and techniques. Little evidence was presented that the private sector was dynamic, innovative, and flexible and large corporations, in particular, have proven to be just as cumbersome and heavy-footed as the most bureaucratic of government departments. However, is there something distinctive about the public sector which requires managerial skills and functions unique to this sector?

Discussions of difference focus on a number of dimensions. First, that of publicness, that is, how is the organization funded, who owns and controls it, and what are the features of its external environment? All organizations operate in unstable environments that are subject to the law, to political oversight, and to the demands of fickle citizens whether they are acting in their capacities of clients, users of services, patients, or customers. All organizations are regulated by law, including the protection of consumer, client, and employee rights or the protection of the environment. All organizations are subject to key external stakeholders in the form of shareholders, or the voting public or politicians themselves. It could be argued that the political life cycle requires short-term results, similarly so do shareholders other than institutional shareholders that might be in it for the long haul.

It is difficult to argue that many organizations are fundamentally public or private. Neither schools, health services, social services, police, nor prison services have been immune from competition in some form or another. Thus, variance between different sectors in terms of publicness appears to be ones of degree rather than absolute (Boyne 2002).

A second dimension of difference might be in terms of public sector organizations having

multiple and, sometimes, ambiguous goals, and there does appear to be some support for this. Think of the prison service that is committed to both rehabilitation and to retribution or to children's services when it is not always clear what is in the best interests of the child when estranged parents cannot agree on custody arrangements.

A third area of difference might be in terms of organizational structure relying heavily on hierarchy although there appears to be little evidence that the private sector generally is leaner, less bureaucratic, more flexible, and with greater managerial autonomy at lower levels.

A fourth dimension concerns the values that public officials hold dear. It has long been considered that important principles underpin public service, and these include honesty, integrity, accountability, impartiality, respecting the law, selflessness, openness, and responsiveness. A public service ethos is said to exist that public officials subscribe to. They are expected to practice these principles to the best of their professional expertise and to make efficient and effective use of public funds. They are motivated by a keen commitment to the public interest and less interested in financial incentives and find reward in work that makes them believe they are "making a difference." In the debate over whether public services should be delivered by private sector contractors, a key issue is the extent to which said contractors will act in the private interests of their shareholders rather than the public interest. Nevertheless, research on public service motivation has demonstrated that individuals working in other sectors can subscribe to similar principles. Once again, the 77distinction between different sectors is not entirely clear and that similar values can inform the work of managers working in different sectors.

If country and regional differences in managerial functions are examined, then the picture is equally blurry (Lynn Jr 2006). It has been argued that under NPM management tasks converge and that delivering public services under similar conditions requires comparable skills. However, evidence of convergence has been easier to find in rhetoric rather than in practice. The Anglo-Saxon version of NPM is more hard-edged than the continental European version. For example, national characteristics impact the role of public officials and will include the type of state; the extent to which the civil service is politicized; the extent of federalization; the traditions of public service; social and cultural norms concerning nepotism; the extent, and acceptance, of bribery and corruption; and so forth.

## Conclusion

Public managers work in a complex, ambiguous, and messy environment and it is not getting any less so. They have to be adaptable, resilient, tenacious, driven, and engaged and welcome change. Was it ever different? While today's environment may be less stable and the pace of change quicker, let us not forget how public officials exhibited similar qualities in the past, particularly in times of turbulence experienced, for example, during the Second World War.

It is also the case that public managers today are expected to exhibit different types of skills. It is no longer evident that expertise in a particular profession whether it be teaching, architecture, or the law would be sufficient to ensure career advancement as strategic, financial, and people skills are all considered essential for today's top managers in the public services. This cuts both ways as financial and operational skills in themselves are not sufficient without a deep knowledge of the business or the profession that is being managed and led.

A picture of a dynamic public service environment with managers having to adopt and develop new skills has been presented. Moreover, the enduring nature of hierarchy, rule-following, standard operating procedures, the importance of financial planning and budgetary control, day-to-day focus, and the pressure to meet central government targets is conceded. They cannot be dismissed as relics of a bygone age; rather, the functions of managers reflect the particular services within which they operate, and the skills required to carry out those functions will vary from service to service. The public service is not constituted by a monolithic bureaucracy but is formed by many

large- and small-scale activities delivering different services to citizens within the parameters of political oversight, justice, and fairness.

# Managerial Leadership

Arthur J. Sementelli
School of Public Administration, Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Leader as Manager; Manager as leader

## Introduction

Managerial leadership is a term most often used in the 1970s as part of broader scholarship that attempted to understand how a manager might be a leader without necessarily occupying a traditional leadership position in an organizational structure. Since then, it has increasingly been folded into more generalized discussions of leadership theory while remaining in use primarily in practitioner-based applications and outlets. Notable exceptions remain, but in many instances, this conflation into more general discussions of leadership has removed some of the meaning associated with the term "managerial leadership." Scholarly discussions in the literature often emerge from the work of Yukl (1989), who provided important insights into major issues in discussions of managerial leadership. Consequently, though it might appear somewhat dated, the Yukl (1989) piece remains as a foundation for anyone who wants a substantive basis for the state of managerial leadership theory and praxis.

There are two basic scenarios where managerial leadership can be observed or experienced. The first scenario is the manager as a leader, where an employee in a traditionally managerial role takes on leadership duties including but not limited to acting as a change agent. The second scenario is the leader as a manager where the leader addresses the implementation, maintenance, and reinforcement of processes such as organizational change. In a tactical sense, the leader becomes intimately involved in the day-to-day management of affairs, which is normally part of managerial practices.

## Conditions for Managerial Leadership

Managerial leadership requires certain conditions to be met for it to happen. In each case, there must be a person charged with the supervision of employees that has either a strategic or tactical scope. The responsibility is for both employees and the results of their efforts. Using the terms strategic and tactical, one might claim managerial roles are primarily tactical in nature, while leadership roles are primarily strategic. Even with the identifiers of tactical and strategic, we are left with the assumption that organizations are tasked to solve problems, regardless of the sector they happen to occupy. Subsequently, it is likely that the tactical achievement of organizational goals might have certain strategic effects, regardless of whether or not they are intended. Furthermore,

organizations are responsible to some group such as a board of directors, investors, citizens, or other proxy for society. This in turn implicitly allows for the possibility that tactical decisions (primarily managerial) can impact work groups, the organization as a whole, and the responsible group. In this sense, managerial decisions can affect leadership environments, decisions and strategy, and vice versa.

Understanding that the impact of management and leadership on organizational goals is not one way, but it is dynamic and helps to better capture the tensions among organizational goals and managerial leadership Northouse (2015). If we work from the notion that organizations are designed to cooperatively provide solutions, rather than setting the target goals, we uncover a space that allows for multifaceted leadership and managerial behavior. As goals are typically poorly defined, especially in the public sector, the manner in which managers and leaders approach achievement can vary wildly, raising questions of administrative discretion, authority, and other foundational concepts largely beyond the scope of this discussion Northouse (2015). The notable exception would be situations where an employee is engaged in a "leadership behavior" not a part of their formal position. In most situations, even within discussions of whistle-blower behavior, which has certain institutionalized protections, these actions are problematic for both the organization and employee, given structural power disparities. So even when the intent of leadership behavior is positive, it remains problematic within the confines of public, nonprofit, and private organizations, where it could reasonably be identified as insubordination.

So, we are left with a recurring problem. Managers are often assumed to be focused on the tactical attainment of organizational goals. It is this arguably narrow assumption that often fails to take account for the leadership behaviors managers undertake regularly. For example, managers promote effectiveness by directing subordinates Northouse (2015). This might require inspirational behavior and communication, which is often seen as a leadership behavior. Confusing matters further, managers also tend to populate executive positions leading to the need for research by Andersen (2015) as an example of how we might begin to apprehend the conflation of managerial leadership with other "forms" of leadership, including political and transformational leadership.

The position of manager also has an explicit assumption that there are subordinates along with tasks. This a priori hearkens back to classical and neoclassical discussions of leadership and supervision with an implicit social contract among all parties (managers, leaders, subordinates), where the subordinates agree to take direction from managers and leaders as long as they are moving toward accomplishing organizational tasks. The other part of this is that clear communication remains essential among all parties. A major problem that emerges from these needs is that the sources of power are often both temporary and poorly delineated, allowing for negative outcomes due to unclear lines of authority and responsibility.

Some scholars including O'Reilly and Reed (2010) wrestled with the multiple natures of a manager and leader, characterizing them as hybrid behaviors. This has some potential, especially in the context of service-based organizations which tend to be more fluid and complex, particularly when responding to citizen and client behaviors. Both citizen and client behaviors have the problems of being politically shaped and situationally fluid, creating multiple opportunities for conflict, confusion, and dissatisfaction Croft et al. (2015), making it an ideal context for the hybrid behaviors proposed by O'Reilly and Reed (2010); Blom and Alvesson (2014).

Furthermore, the demand for managerial and leadership participation becomes more pronounced in contemporary organizations. Rather than targeting formal organizational relationships, Yukl (1989) identified how hybrid behaviors emerge when there is less reliance on formal structures and more on situational or tactical events also common to service-focused organizations allowing for managers to act as leaders and vice versa. Rather than "creating" a need for more leaders or managers, an existing supervisory, specialist, or executive personnel can fill immediate

needs albeit on a temporary basis consistent with how we understand the practices of "managerial leadership."

## Differentiation Issues

Literature tends to organize managers as transactional and leaders as transformational. In practice, this suffers from a lack of clarity, as managers in general, and managerial leaders can frequently undertake leadership behavior that could be identified as transformational. Moreover, some claim that there are few (good) "leaders" available to serve in organizations as catalysts for transformation, making it more likely that people occupying leadership positions are characterized as transactional leaders muddying things.

This confusion is most apparent in the public sector where long-standing questions regarding the abuse of discretionary power abound, alongside hyper-politicized contexts aching to seize opportunities to extend some real or imagined sphere of influence. Consequently, managerial leadership (by the manager) is best tolerated during crises or natural disasters where there appears to be more implied comfort with individuals operating outside the formal organizational chains of command.

At the core of the problem is an implicit desire for people, particularly those in supervisory roles, to exhibit and encourage the behaviors of proactivity, risk seeking, initiative, and creative adaptation, which essentially gives every employee the potential to be either a leader or manager in certain environments. It is this sort of active participation which tends to be problematic, especially during a contemporary age of oversight, where most, if not all, decisions and choices in public organizations are scrutinized, evaluated, and critiqued.

What can mitigate the negative connotations of such environments? First, it is beneficial for the person engaging in either the managerial or leader behavior to be highly skilled, qualified, and/or experienced relative to the context of the situation. Second, some demonstrations of past success in handling related or otherwise similar situations tend to assuage some of the concerns about abuses of power, lack of oversight, and possible damage. Third, if the organization has multiple contingencies in place for uncertainty, it can help maintain lines of authority and responsibility and can mitigate concerns about unchecked discretion in particular by recasting managerial leadership as part of developmental or situational processes that maintains oversight.

## Conflation Issues

Some problems of conflation stem from a lack of clarity about what it means to be a "leader" versus a manager. As early as 1964, Blake and Mouton (1964) developed a *managerial* grid model which also is known as a *leadership* grid. Throughout discussions of their work, people consistently use "leadership" and management concepts interchangeably. This failure to adequately differentiate among managerial and leadership conceptions early in the development of the literature helps explain why the notion of managerial leadership has largely been absorbed into more generic discussions of leadership. Leadership also suffers from an inherent lack of conceptual clarity and cohesion.

Contemporary scholarship on leadership has made modest improvements in regard to the study or use of managerial leadership and its practices. Leadership generally remains somewhat unclear, and only a few (i.e., Van Wart) are concerned about either conflation or the inherent ambiguity in the scholarship. Another scholar, Anderson (2015), raised concerns about conflation by examining transformational leadership and political leadership concurrently with managerial leadership. Anderson concluded that transformational leadership is a political leadership theory, making it "less relevant to managerial leadership" (Andersen 2015, p. 765). Moreover, he alluded to how issues of conflation might be at least partially responsible for inconsistencies in empirical research. Briefly, poor theory can lead to inconsistent outcomes.

The conflation of political and managerial gets to the heart of the problem. Leadership encompasses multiple experiences, events, and

practices. Rather than attempting to "silo" concepts and categories using terms like managerial leadership, political leadership, transformational leadership, and transactional leadership, it could be more fruitful to examine these ideas as components, elements, or facets of leadership. Empirically, one might treat these concepts as vectors to be examined as part of a more holistic view of leadership. Conceptually, it could move discussions of each of these phenomena or epiphenomena to the forefront, allowing both scholars and practitioners the opportunity to finally begin untangling the concepts surrounding and linking leadership in general to managerial leadership.

As is, the current state of the literature lacks cohesion and suffers from multiple conceptual issues that might be resolved by considering the proposals forwarded in the paragraph above. If undertaken seriously, such a project might benefit both theory and practices of leadership and managerial leadership. Furthermore, it would be beneficial for managerial leadership to be considered as something that allows conceptualizations to emerge from practice, while it also informing them. Additionally, both scholars and practitioners must embrace the possibility that managers can engage in leadership roles and vice versa.

## Moving Forward

Framing some of the long-standing issues provides us with a basis for study. We can argue that "managerial leadership" is an *observable phenomenon* where someone is *acting* both as a manager and as a leader at the same time. This identifies a key property of the concept, the simultaneous presence of both managerial and leadership behaviors. Next, we can consider how this might happen if we have managers and leaders. "Manager" and "leader" often are labels, titles, and positions (Andersen 2015). In contrast, managerial leadership is a practical action that reflects the experiences of someone labeled as either a manager or leader. Scholars might consider the triggers for behaviors unique to managerial leadership. Finding antecedents is likely the simplest and most impactful of the three questions considered here. As a starting point, one of the more obvious antecedents might be unplanned or planned changes stemming from some shift in the political, social, economic, or built environments. Both the change management and organization development literature could provide powerful insights into theory and practices of managerial leadership.

Once the proposed questions for moving forward have begun to be adequately explored, we can then move toward more coherent, focused discussions that impact theory and practices of leadership studies generally. As an example, one might next consider why someone without the label of "leader" might function as one in certain contexts (i.e., crises) and how we might reconcile such behavioral choices with mainstream themes like administrative discretion. Conducting a circumspect analysis of managerial leadership and its relation to public affairs can clarify and shape how we view personality, training, and experiences.

Drilling down further on the "environment," it remains important to consider questions of effectiveness and of course power alongside discretion. Managerial leadership has some potential to explain uncommon situations where managers behaving as leaders can operate outside their formal sphere of influence. Considering and reflecting upon these phenomena can help build bridges to the bureaucratic behavior literature as well as the streams mentioned earlier.

Consider further how links to both the organization development and change management literature allows change agents to be identified as managerial leaders. This might justify how one might improve performance by making adjustments to the situation or environment. In classical hierarchical structures, but more so in public organizations, such decisions and action can elicit multiple conflicting responses ranging from concerns about abuse of discretion by a manager to a lack of "leadership."

Building linkages to multiple theory streams helps supplement the understudied almost unitary reliance on law to address managerial and leadership behavior. Adopting a praxis-based approach

can help us better understand the nuances and difference among vectors of leadership, especially managerial leadership. It remains imperative to sort out the issues of differentiation and conflation presented above prior to meaningful engagement with the concept. Otherwise, understanding managerial leadership becomes unnecessarily challenging in the context of discretion, formal authority, oversight, and related concepts.

The conflation of managerial leadership and political leadership is most troubling. It has become common in economic organizations to treat the two as similar if not identical concepts. This is problematic since managers operating as *political* leaders, engaging in activities related to social movements and other behavior most associated with the practices of transformational leadership, tend to fly in the face of professional standards. Managers could conceivably unintentionally cause harm to their own organization. If such an action is intentional, such practices of managerial leadership can evoke discussions of the "toxic triangle" literature (Padilla et al. 2007) or the classic work by Finer (1941) in the context of public and nonprofit organizations.

## Best Fits

Note that the questions raised earlier rarely impact the private sector. There are multiple cases where proactivity, risk seeking, initiative, and creative adaptation behaviors are highly incentivized, particularly in telecommunications and R&D-focused organizations. From this perspective, managerial leadership appears most suited to private sector, knowledge-intensive organizations with nontraditional organizational structures more comfortable with elevated perceptions of risk.

Managerial leadership appears more suited to organizations and environments which cyclically experience radical changes at a brisk pace, which supports a sectoral fit for the private sector and possibly some specific nonprofit or not for profit organizations that meet organizational change criteria. As a concept, managerial leadership might best be understood as an emergent phenomenon, meaning that overall changes in economies, combined with steady movement away from traditional organizational structures and practices, make it more likely to be observed than in traditional organization forms.

Despite the limitations discussed in this piece, managerial leadership has interesting characteristics that make it viable for reconsideration in the context of contemporary public administration and governance. It can express some of the dynamic elements of both leadership and management not adequately captured by other related concepts. Areas of inquiry including those emerging classical organization theories (ala Barnard 1938) and more contemporary work on leadership by organizational subordinates (Yukl 1989) allow for both academic and practitioner consideration of managerial leadership. It has enhanced potential in the context of unplanned changes and crisis, providing some insight on how public organizations react to both risk and uncertainty, possibly even as a phenomenon for organizational diagnosis. We conclude with a concept that has been employed intermittently across sectors for decades. Managerial leadership has appeared sporadically in discussions of public sector leadership and leadership more generally. To be relevant in contemporary public affairs and governance, scholars and practitioners must be cognizant of the issues raised in this piece.

# Managerial Performance Appraisal

Behrooz Kalantari
MPA Program, Savannah State University, Savannah, GA, USA

## Synonyms

Performance assessment; Performance evaluation

## Definition

A systematic, general, and periodic process that assesses an individual employee's job performance and productivity in relation to certain pre-established criteria and organizational objectives.

## Introduction

Human resource management (HRM) covers the design, development, and implementation of interrelated activities that influence how a work organization attracts job applicants, retains motivated and successful employees, and ultimately carries out a proper performance appraisal. The main objective of the performance appraisal is to improve organizational efficiency and productivity. People are the organizations' best assets, and without proper direction from HRM, the organization would seize to exist (Manzoor 2012). Effective HRM practices have been linked to higher employee performance, customer satisfaction, and greater financial results (Dressler 2003). Therefore, after hiring qualified employees, properly measuring their performance and keeping them motivated becomes an essential task in order to accomplish the objectives of the organizations.

## Strategic Human Resource Management

In recent decades, due to the complexity of organizational issues, it has become a common practice for HR personnel to practice strategic human resource management. Strategic HRM refers to the stage when decisions are made by human resource managers after taking into account the mission, vision, and current status of the organization (Berman et al. 2016). Based on this model, the direction of the organization is determined through coordination of daily operations with the organizational goals and objectives in mind.

Using the strategic HRM approach, the main objective is to align personnel's knowledge, skills, and abilities with the vision, mission, and goals of the organization with a view on increasing organizational commitment and employee efficiency. Strategic HRM uses organizational behavior theories and principles to improve employees' attitudes and behaviors. Ultimately improving organizational productivity is affected by the way performance evaluation systems are designed and implemented. When employees have a sense that they are valued and their contribution and work is appreciated by the organization, they exhibit organizational citizenship behaviors, specifically organizational commitment and productivity (Gavino et al. 2012). Better organizational commitment and performance and better outcomes is an indication of alignment between the organizational mission, vision, and goals and operationalized strategies through a viable performance evaluation system.

## Performance Evaluations: Proponents

The practice of performance appraisals has its proponents and opponents. Supporters argue that the performance appraisal (evaluation) is the most

vital task of determining an employee's success in an organization. Performance appraisal refers to the process and activities used to determine (measure) each individual employee's contribution to the overall effectiveness of an organization. Many studies on organizations substantiate the observation that those organizations that put more emphasis on the development of their human capital remain more productive and efficient in accomplishing their goals and objectives. As a result, employee development has to be planned properly and be coordinated through the proper establishment of a valid performance evaluation system (Buss and Morse 2008). This makes performance evaluation the most crucial activity to be performed in any organization. The process of performance appraisal is an inherent and indispensable part of the operations of all organizations. Therefore, for any organization to achieve its strategic goals, it has to devise a viable system of performance appraisal that pays more attention to the human element of the organization (Stivers 2001).

Performance evaluation is the major tool to measure and communicate the gap between how productive employees are and how much they have to improve (Boswell 2002). In addition, appropriate performance appraisal is a great contributor to organizational success because it helps with the achievement of desired organizational goals and objectives (Stivers 2001). In order for the performance appraisal to be effective, it has to be done regularly and properly designed and implemented across the board (Naeem 2017). After completion of a performance appraisal practice, if it is conducted properly, the employees should be aware of their strength and weaknesses and know exactly what kind of training they need to fulfill the requirements of their job. In addition, it can be a major motivational source for employees because it tells the employees what areas they are good at and will be rewarded for and what areas they need improvement.

A viable performance appraisal system needs to be designed for enhancing employees' trust and making them believe in the fairness of the system. The evaluation appraisal system has to be very transparent, and the organizational objectives (strategies) need to be very clear in order for the employees to exert their full efforts toward achieving them. It is thought that such an evaluation system will positively affect organizational effectiveness, efficiency, job satisfaction, job involvement, absenteeism, and job stress.

## Performance Evaluations: Opponents

Critics have argued that there are several problems with the evaluating systems used at the present time, especially in the public sector. They include the usage of a generic evaluation format (ranking system) throughout the organizations by which employees are evaluated at the end of an annual period and are ranked against each other. This system has two major problems. The first one is that it evaluates factors that are not related to the goals and objectives (strategies) of the organization. The second problem is that it makes the performance appraisal system a competitive exercise among the employees by ranking them against each other.

In the ranking for performance, each individual tries to surpass the other rather than attempting to grow and develop themselves. This approach is counterproductive because it stops the growth and development of the individual and not enough attention is given to the growth of their individual talent(s) that may benefit the organization. In contrast, the emphasis should be on how to help the employees to reach their full potential rather than requiring them to match the performance of certain individuals inside or outside the organization. For employees to be at their best, they should be able to follow their own individual path of development and choose how to pursue their individual goals by themselves. In other words, they should be compared to themselves rather than to someone else elsewhere.

In order to deal with the negative effect of this type of evaluations, the managers should have frequent meetings with the employees and provide one-on-one feedback on their performance. In these meetings, employees develop their own personal objectives that are directly related to the organizational objectives (strategies) and ask for

the resources to meet those objectives. In this process the employees become responsible for their objectives and take ownership of the accomplishment. They also become responsible for their own growth and development. This does not underestimate the role of the manager to assist the employees in any way possible to accomplish their objectives.

## Performance Evaluation Systems

Starting in the 1950s, for over two decades, most of the evaluation systems, especially in the private sector, were "trait-based." The trait-focused system concentrated on characteristics such as loyalty, helpfulness, dependability, and punctuality. Most trait-focused systems use a simple checklist with ratings such as "excellent," "satisfactory" or "needs improvement," or similar options (Ismail 2018). However, in reality, the appraisal format focused on the proxies of performance and did not establish a relationship with the actual performance of individual employees. In this method, the criteria used were remotely associated with actual performance; therefore, they were practically useless in determining the actual performance of employees.

Major changes in performance appraisal standards came after the passage of the Civil Service Reform Act of 1978, which tried to fix the shortcoming of the "trait-oriented" performance appraisal. Presently several "result-based" methods are used to improve the previous system which can be referred to as "result-based systems." These types of performance appraisal also known as "outcome-oriented" approaches do not look to employees' behavior nor do concentrate on the personal characteristics or personality of employees. Instead, the result-based systems approach looks at their contribution to the goals and objectives of the organization as well as the accomplishments of the organizational tasks. For this system to be successful, it is important that organizational goals and objectives are clear and concise, and employees should be able to know what to expect. During the years, many appraisal systems were developed that derived from the result-based systems philosophy. They include the following:

1. Behaviorally anchored rating (BARS): is designed to measure the successful behaviors that relate to the performance of a job.
2. Checklist method: lists several different statements concerning the behaviors that contribute to the accomplishment of the job.
3. Critical incident method: the rater keeps a file of each critical incident that might influence the performance of an employee.
4. Essay method: the rater composes an essay on the strength and weaknesses of the employee in performing the job.
5. Graphics rating systems: the rater is provided with a special scale in each category under evaluation and is required to rate each employee in that category.
6. Ranking methods: the rater looks at the organization as a whole and ranks employees according to their contribution.
7. Work standards: usually is used in production industries and establishes a national average for every industry. Everyone's performance is evaluated against those standards.
8. Self-appraisal: Employees are supposed to evaluate themselves and provide an honest opinion of their own performance and their contribution to the organization (Kalantari 2007).

## Pitfalls of Performance Evaluation Methods

As indicated earlier, conducting the performance evaluation of employees' work is the most critical stage of the overall functions of a manager. However, most studies found that even if all previous stages are conducted properly, there are still some precautions that have to be taken into consideration to complete the process accurately. In general, there are three most common categories of errors that might negatively influence the process of performance evaluation including the following:

1. Range error: This error is associated with the general psyche of the evaluator. Using the

normal "bell curve instrument," some evaluators like to rate all employees in one particular area of the normal curve, for example, if the rater puts everyone in the positive area of the curve has committed a "range error."

2. Perceptual and personal bias: It manifests itself in two ways either in a positive (halo effect) or negative (horn effect) manner.
3. Association error: The evaluating factors that the evaluator uses to evaluate employees are associated with factors that are unrelated to the task accomplishment. They include errors such as "recency error," "organizational politics," "group vs. individual focus," and "similar to me" (Kalantari 2007).

All of those errors can severely influence the process of conducting proper performance evaluations. The errors can demoralize the employees and as a result reverse the positive impact that performance appraisals can have on the employees. In reality, it turns the evaluation system into a de-motivator which ultimately negatively affects the productivity of the organization.

In the final analysis, it should be emphasized that a viable and accurate performance evaluation (appraisal) system should start with a clear, concise, and actionable strategic plan that can guide the development of clear and actionable goals. After the development of clear goals, the most important part of the process is development of achievable and actionable objectives that usually are referred to as "strategies." They represent specific activities that are required in accomplishing the organizational tasks (performance indicators) which are the same as organizational objectives (strategies). Those strategies later become the main goals of employees to achieve.

Therefore, development of performance indicators that are measurable and actionable is the most important part of the process of conducting the proper performance evaluation. In addition, it is essential that everyone in the organization is aware of the development of those strategies and how they are going to be measured in order to get the most buy-ins among the employees. Finally, those specific strategies have to be under constant review and improvement in order to achieve the best fit between the organizational objectives and individuals strategies. As indicated earlier, they have to be clear, unambiguous, and actionable. After actionable strategies are clearly set, they have to be assigned to employees to be accomplished. In the end, employees should be able to demonstrate if they have accomplished their goals (strategies). It is important that the evaluator be aware of the pitfalls of the evaluation process at all times.

## Conclusion

Employees can receive constructive criticism and be able to learn from their mistakes through open lines of communication with their evaluators. Professional development is essential in any evaluation practice. Employees can grow and learn from their performance and try to do better when it comes to future performance. The manager can find what the employees are passionate about and find a common ground between their passion and organizational objectives (strategies), something that helps them to grow and develop a positive relationship with their jobs.

# Managerial Power

M. Afzalur Rahim
Center for Advanced Studies in Management, Bowling Green, KY, USA

Power is "the fundamental concept in social science. . .in the same sense in which energy is the fundamental concept in physics" – *Bertrand Russell* (1938, p 12)

## Synonyms

Authority; Command; Control; Influence; Sway

## Synopsis

There are six power bases managers can acquire, maintain, and use appropriately to achieve desired results. These bases are coercive, reward, legitimate, information, expert, and referent. The first four are called position powers and remaining two are called personal powers. These power bases, except coercive, can be effective in attaining desired results depending how they are used. Coercive power can be used for disciplining a subordinate, maintaining safety standards, or for dealing with emergency situations, but too much exercise of this power can have negative consequences in the long run. Other position powers, such as reward, legitimate, and information, can be used to obtain desired results, provided that the influencing agents have high expert and referent powers. Also expert power can be used to achieve desired results, but the influencing agent must have high referent power. In other words, personal powers mediate the relationships between position powers and desired outcomes. Also referent power base mediates the relationship between expert power and desired results. Another way of understanding this is that position powers are ineffective unless a supervisor possesses adequate personal power bases. Managers who possess high personal power use position powers more effectively than managers who have low personal power.

## Introduction

Power is a significant construct in management and other social sciences and it "is as ancient and ubiquitous as any that social theory can boast. . .one could set up an endless parade of great names from Plato and Aristotle through Machiavelli and Hobbes to Pareto and Weber to demonstrate that a large number of seminal social theorists have devoted a great deal of attention to power and the phenomena associated with it" (Dahl 1957, p. 201).

During the last six decades, there were many theoretical and empirical studies on power in organizations and its influence on subordinates' job performance, job satisfaction, motivation, commitment, and turnover intention. Managers need power to influence subordinates so that desired goals are attained. Managers who feel powerless are likely to be frustrated and ineffective. There are several sources of power that may be used to influence subordinates. The phenomena of social power are all pervasive in groups, organizations, and societies. The process of exercising power in organizations influences dyadic relationships between supervisor and subordinates, between colleagues, and two unrelated individuals. Effective managers are able to acquire, maintain, and use the right types of power to deal with various situations needed to attain desired goals. In other words, the essence of effective leadership is associated with the use of power appropriately to obtain desired individual, group, and organizational goals. The objective of this chapter is to discuss the various types of

power that may be possessed by managers, how these powers can be acquired and maintained, and how these powers can be used to deal with various situations to attain desired goals.

## Nature of Power

### Defining Power and Influence

Power is defined as the ability of one party to change or control the behavior, attitudes, opinions, objectives, needs, and values of another party (Rahim 2009). This definition implies that the theory of power for the present discussion is associated with the influence one has over another individual. *Power bases* differ from *influence attempt* as the former is associated with the ability to use power and the latter with the actual use of power. Compliance with the wishes of a supervisor is associated with the amount of power possessed and used by the supervisor.

### Taxonomy of Power Bases

Several classifications of leader or supervisory power have been set forth, but the bases of power taxonomy suggested by French and Raven (1959) and Raven (1993) – coercive, reward, legitimate, information, expert, and referent – still appear to be fairly representative and popular in application. There were many theoretical work and empirical studies on the French–Raven taxonomy of power bases (Hinkin and Schriesheim 1989; Ivancevich 1970; Rahim 2014; Rahim et al. 2001).

**Position Power Base**. Coercive, reward, legitimate, and information power bases are associated with the rank or position a manager holds in an organization. That is, a manager acquires these power bases by occupying a position in an organization. These power bases together constitute the position power of an organization**al** member.

*Coercive Power*. This is associated with subordinates' perception that their supervisor has the ability to punish them if they fail to conform to the influence attempt. Giving poorperformance review, suspending, ridiculing, demoting, or reprimanding a subordinate constitute common ways of using coercive power by a supervisor. This power is essentially based on the subordinates' perception that their supervisor can punish them for noncompliance.

Supervisors can use this power occasionally to induce compliance from subordinates to deal with emergency situations, meeting deadlines, and maintaining safety standards. Unfortunately, frequent use of this power will be counterproductive as it may lead to reduced job performance, job satisfaction, and alienation of employees. Frequent use of this source of power may be associated with decline in productivity and creativity. If some employees feel that they have been unfairly punished, they may withhold their contributions to the organization or leave their organization. Performance-contingent enactment of this power base is needed to minimize its adverse effect.

*Reward Power*. This is associated with the perception of subordinates that their supervisor can reward them for desired behavior. Supervisors often use financial rewards, such as pay raises, bonus, and promotions, and nonfinancial rewards, such as recognition, advancement, and pleasant work assignments to exert reward power over their subordinates. In order for this power to be effective, rewards must be provided to the employees for job performance and other contributions to the organization. There must not be any rewards for nonperformance or for political reasons.

There are some limitations to using this power. Supervisors may not have any control over pay raises, bonus, and promotions. In many cases the decisions regarding these are generally made by top management or board of directors. Also individual employees may have different needs – some want recognition and others want opportunities for growth – which cannot be satisfied with the standardized rewards system of an organization. Therefore, it is often quite challenging for supervisors to provide appropriate rewards to satisfy individual needs. Under this situation, supervisors are well advised to provide nonfinancial rewards to employees.

*Legitimate Power*. This comes from the position or organizational rank that a supervisor holds. It is associated with subordinates' perception that their supervisor has a right to expect compliance

with his/her wishes. This power is based on the internalized values of the subordinates which dictate that the supervisor has the right to prescribe and control their behavior and they have the obligation to accept the influence. A primary source of this power is the cultural and institutional acceptance by subordinates of roles played by supervisors. Appropriate uses of coercive and reward powers can enhance legitimate power.

Leaders often rely upon legitimate power to exercise authority, though overreliance upon it for more than routine processes is often self-limiting. Effective leaders do not rely on this power to motivate their workforce. As will be seen later, these leaders use their personal powers to motivate employees to attain goals. Also there is a "zone of indifference" within which the subordinates will accept directives (Zelditch and Walker 1984). This power is ineffective outside this zone. In other words, subordinates will comply with the wishes of their supervisor if they believe that their supervisors have legitimate authority to do so. Employees will resist following supervisor's instructions if they believe that their supervisor's instructions are not legitimate.

*Information Power*. This type of power is associated with employees' belief that their supervisor possesses or has access to special proprietary information needed by employees to perform their jobs. A supervisor may have access to privileged information that can be used to influence the behavior of subordinates. This power also includes one's ability to acquire information that others want which is not presently available.

We are now living in an information age, so this power has become more important than ever. Failure to provide the right information to the employees on a timely basis by managers may diminish this power base. In order to enhance this power base, a manager has to acquire relevant information continuously and distribute it effectively.

**Personal Power Base**. The remaining two power bases are associated with a person, not a position. Individuals acquire these power bases through their own efforts and together they constitute personal power.

*Expert Power*. It is based on subordinates' belief that their supervisor has adequate professional experience, training, special expertise, and access to knowledge who will be able to deal with the unit's problems effectively. Accountants, marketing researchers, and engineers may exert significant influence on their subordinates because of their specialized skills. Supervisors with this power base should be able to solve task-related problems brought by employees.

Expert power of managers may be diminished in course of time if they fail to improve and maintain their professional knowledge and skills. If a manager shares his knowledge with subordinates frequently, it may diminish this power base. The challenge for managers is to continuously improve their knowledge and skills through self-learning, education, and training. It should be noted that expert power may also be possessed by subordinates who have professional knowledge and judgment a supervisor must rely upon for effective work-related decisions.

*Referent Power*. This type of power is based on the desire of subordinates to identify and associate with their superior. Identification is the feeling of oneness of a subordinate with their superior. Here the control is dependent upon the supervisor's leadership style or charisma to attract subordinates so that they follow their leadership. Managers with high referent power have personal qualities that inspire subordinates to do their job better. Rahim's (2014) study shows that referent power is more effective than other power bases in influencing subordinates' job performance and satisfaction. Managers with high referent power are able to generate trust, openness, and respect in their interactions with others. Without these leadership qualities associated with referent power, other power bases may not be very effective in changing the behaviors of subordinates. There are other variants of referent power which are as follows:

*Affiliation or Connection Power*. Leaders acquire this power from their acquaintance or association with influential individuals inside or outside the organization. People with this power within an organization can get things done

more effectively than others. Individuals who form valuable relationships with others (networking) acquire this power.

*Credibility Power*. This power is associated with one's trustworthiness, integrity, and reliability.

*Persuasiveness Power*. This is another variation of referent power which is associated with one's articulateness, expressiveness, and ability to reason effectively. Leaders with high social skills are likely to possess this power.

*Prestige Power*. This is associated with the status, esteem, or personal reputation of leaders in organizations.

As discussed before, referent power is more effective than other power bases in influencing outcomes, such as subordinates' job performance, satisfaction, and turnover intention. Greater referent power gives increased emphasis and utility to the other power bases for a leader. Another issue is the clear linkage between expert and referent power bases. This probably indicates that managers who have high expert power have high cognitive abilities, but managers who are high on referent power have high noncognitive skills, capabilities, and competencies. It is very possible for a leader to possess both competencies. Goleman (1998) has suggested that managers with the later skills possess what he calls emotional intelligence (EQ). Without EQ "a person can have the best training in the world, an incisive, analytical mind, and an endless supply of smart ideas, but he still won't make a great leader" (Goleman 1998, p. 108). The field of leadership studies would benefit from further research that investigated connections between power bases and EQ.

## Interdependence of Power Bases

There are significant intercorrelations among the six power bases. These interrelationships should be explained so that management practitioners can acquire and use appropriate power bases to influence their subordinates' job performance and satisfaction. A change in the perception of one power base may affect the perceptions of other power bases. For example, a change in the perception of reduced reward power may affect the perception of greater use of coercive power and the reduction of legitimate and referent powers, but not expert power (Greene and Podsakoff 1981). Knowing how power bases influence each other is important as each power base may influence outcomes, not only directly but also through the mediation of other power bases. It appears that the position power influences outcomes through the mediation of personal power. Stated in another way, position power influences the personal power, which in turn, influences outcomes (see Rahim 2014). These findings make sense, as supervisors who use reward power associated with performance as well as their legitimate power may be perceived by their subordinates as competent, friendly, considerate, and fair.

Several studies have found that the expert and referent power bases were also significantly correlated. One possible explanation of this phenomenon is that subordinates like to identify and associate with a supervisor who possesses expert power. Furthermore, these studies reported that the reverse influence (i.e., referent power influencing expert power) is unlikely to happen. In other words, the perception of expert power positively influences the perception of referent power, but the reverse relationship is not possible.

## Comparing Managerial Power Profiles Across Cultures

Rahim and Magner's (1996) cross-cultural field study that compared the power profiles across three national cultures – the USA, South Korea, and Bangladesh – suggests interesting patterns that are likely important for expatriate managers. First, supervisors in individualistic cultures (such as the USA) appear to generally have higher levels of each power base than collectivistic cultures (such as S. Korea). Second, supervisors in individualistic cultures appear to place greater relative emphasis on coercive power than do those in collectivistic cultures, while supervisors in collectivistic cultures appear to place greater relative emphasis on expert power than do those in individualistic cultures.

There are important implications for expatriate managers who are assigned to work in cultures different from their own. These managers may be

well served by participating in training so as to change and use their power bases consistent with the host cultures. For example, coercive power in an individualistic culture may have been used extensively in dealing with subordinates, but it is likely to be ineffective as a basis for leading employees in their new work setting in a collectivistic culture.

## The Dark Side of Power

People are familiar with the expression, "Power corrupts and absolute power corrupts absolutely." Effective managers use their power bases to achieve desired results. Unfortunately, some managers have used their power bases for their personal gains. This is true for all the power bases, but the personal powers can be used in ways that subordinates will not notice, but they are used to manipulate subordinates to attain selfish ends. The following case – Misuse of Power, adapted from Rahim (2016) – is designed to show the dark side of power.

### Misuse of Power

"It hardly seemed possible that the man had sway over politics and media for so long. Appearing before a Parliamentary committee on July 19, 2011 to explain how phone hacking had flourished in his British newspapers, why his company is alleged to have paid $160,000 in bribes to policemen, and why two people in his pay have been jailed and several arrested, Rupert Murdoch paused alarmingly and fumbled his answers" ("Last of the moguls," 2011, p. 9). It is alleged that Rupert Murdoch's son, James Murdoch, himself authorized hush money to victims, but Rupert Murdoch denied any knowledge about these illegal activities and suggested that he should not be held responsible for these acts committed by his employees.

Rupert Murdoch, by destroying criminal evidence, threatening politicians, hacking phones, and paying off police, could intimidate opponents and make or break government officials. Fresh allegations of attempted phone hacking of Britain's royal family and illegally accessing medical and financial records of former prime minister Gordon Brown by Murdoch's *The Sun* and *Sunday Times* newspapers have caused further damage. Murdoch is known for dictating editorial positions to his papers. He could push politicians to back his ideas on political issues and destroy the careers of politicians with smear campaigns.

Public uproar against News Corporation and its owner Rupert Murdoch resulted in several high-profile resignations including London's Metropolitan Police Service, Sir Paul Stevenson. A number of arrests and convictions followed, most notably of the *News of the World* managing editor Andy Coulson. Boycotts by advertisers resulted in the dissolution of the *News of the World* after 168 years of publication. Also public pressure forced Murdoch to cancel its proposed acquisition of the British satellite broadcaster BSkyB.

Rupert Murdock's father was Keith Murdock, a war reporter in the early 1900s who covered the WWI under strict military guidelines. Later Keith Murdock broke these guidelines while building his empire and influencing the news. "Like Father, Like Son, and Like Grandson – The Murdock family has had their hands in political influence, money, media, and power including infiltrating the halls of government and its secrets" ("Murdoch's dynasty," 2011).

## Effectiveness of Power Bases

### Job Performance

Rahim (2014) developed and tested a structural equation model of the relationship between five power bases and job performance and satisfaction of employees with 254 groups (see Fig. 1). This is the first group-level study which shows that expert and referent power bases mediate the relationships of coercive, reward, and legitimate power bases to job performance and satisfaction, and referent power base mediates the relationship between expert power and job performance and satisfaction. The study contributed to our understanding of the linkages between position and personal power bases, expert and referent power bases,

**Managerial Power, Fig. 1** A new model of the bases of managerial power and job performance and satisfaction of employees

and their links to job performance and satisfaction of employees.

### Compliance with the Wishes of Supervisor

In a major study Warren (1968) found that the use of five types of power by principals was positively associated with total conformity (behavioral and attitudinal) of teachers. The correlation between referent power and conformity was the highest. Rahim and Afza's (1993) study with 308 US. accountants showed that the expert and referent power bases were positively associated with attitudinal compliance, but legitimate and referent power bases were positively associated with behavioral compliance. This study also shows that the expert and referent power bases were associated with a beneficial decrease in employees' intention to leave the organization.

### Satisfaction with Work and Supervision

Satisfaction with work and supervision are important dependent variables for the study of power. This is because one of the principal reasons for the possession and/or use of power is to keep the subordinates satisfied. A study by Busch (1980) indicated that expert and referent powers were positively related to satisfaction with supervision of employees. Coercive power base was negatively, though not uniformly, related to their satisfaction to supervision. Reward and legitimate power bases were not consistently related to satisfaction with supervision.

Studies on leadership by Sims and Szilagyi (1975), Keller and Szilagyi (1976), and Podsakoff et al. (1982) found that reward based on performance was positively correlated with satisfaction with supervision, but punishment based on performance had no effects on the satisfaction with supervision. Rahim and Afza's (1993) study showed that referent power base was positively associated with satisfaction with supervision among accountants. Another study with 476 managers in the USA shows that legitimate power was negatively associated with satisfaction with supervision, while expert and referent power bases were positively associated with satisfaction with supervision (Rahim 1989).

### Organizational Commitment

A study by Rahim and Psenicka (1996) reported that overall position power influences personal power; expert power, in turn, positively influences referent power; referent power, in turn, positively influences workgroup commitment. Finally, commitment negatively influences workgroup conflict. The findings of this study are consistent with Rahim's (2014) study on job performance and satisfaction of subordinates.

Another study showed that conflict management strategies mediated the relationship between power bases and organizational commitment in

the USA and Greece (Rahim et al. 2003). The study showed that referent power is more effective than other power bases in influencing dependent variables. Without the qualities associated with referent power, other power bases may not be very effective in changing the behavior of subordinates.

### Power Bases in Cross-Cultural Context

A study by Rahim et al. (1994b) with 459 managers in the USA and 625 managers in South Korea found that the legitimate, expert, and referent power bases were positively associated with compliance in the USA. In South Korea, legitimate, referent, and reward power bases are associated with compliance. It is not clear why expert power base was not associated with compliance. One can speculate why reward power is associated with compliance in South Korea and not the USA. This study also reported that legitimate power was negatively associated with satisfaction with supervision in the USA and South Korea. Referent power in the USA and reward, expert, and referent powers in South Korea were positively associated with satisfaction with supervision.

A field study in Bangladesh shows that legitimate and expert power bases were positively associated with organizational commitment (Rahim et al. 1994a). This study also reported that coercive power was negatively associated with the effectiveness (performance, conformance, dependability, and personal adjustment) of employees, and expert power was positively associated with effectiveness. Another study in Bulgaria shows that referent power base was positively associated with effectiveness (Rahim et al. 2000).

### Women Executives' Perception of Best and Worst Bosses

Oyster (1992) conducted an interesting study on women executives' perception of the power bases used by the "best" and "worst" supervisors. Results show that male supervisors were more likely than female bosses to be identified as the worst supervisors, but males and females were equally likely to be identified as the best supervisors. The best supervisors used more reward, information, expert, and referent and less coercive and legitimate powers than worst supervisors.

As discussed in the section on the interdependence of all the power bases, an alternative explanation of the weak relationship between position power and outcomes is that position power base may influence outcome variables through the mediation of personal power. In other words, coercive, reward, legitimate, and information powers influence expert and referent powers; expert power influences the referent power, and this, in turn, influences outcomes. In future studies, the relationships of the power bases to other criterion variables, such as motivation, creative behavior, and organizational citizenship behavior of employees, may be investigated.

## Implications for Management

What can leaders do to acquire and maintain the right types of power and learn how to use them to deal with different situations to attain goals? Leaders can be more effective in enhancing functional outcomes of subordinates by enhancing their own personal and position powers. Supervisors' use of reward, legitimate, information, expert, and referent power bases may have compound positive impacts on the subordinates' job performance, satisfaction, and other functional outcomes. The three typical mistakes managers make are:

1. They do not know the types of power they possess.
2. They try to use the powers they do not have to achieve results.
3. They try to deal with different situations by enacting the wrong types of power.

Figure 1 shows that position powers (coercive, reward, legitimate, and information) do not influence subordinates' job performance and satisfaction directly. The reason for this is that personal powers mediate the relationship between position powers and desired outcomes. In other words, position powers can be enacted when the managers have high personal powers. Managers with high personal powers enact position powers

differently than managers with low personal powers. Figure 1 also shows that referent power mediates the relationship between expert power and desired outcomes. This indicates that the use of expert power will not be effective unless a manager has high referent power.

On whole, position powers can be used to deal with many day-to-day matters, but when it comes to dealing with complex issues that require the use of problem solving approach, personal powers have to be used. In order to deal with the preceding discussion on the three problems managers face in using different power bases, the following interventions are suggested.

**Managers Do Not Know Their Power Bases**. They are not fully aware of the extent to which they can access different types of power. Managers can be provided feedback regarding their six power bases. The six power bases can be measured with the 29-item Rahim Leader Power Inventory (RLPI) developed by Rahim (1988) and recently expanded to include information power. The instrument uses a 5-point Likert scale to measure subordinates' perceptions regarding their supervisors' six power bases. The subscales are computed by averaging the responses to each subscale, and a higher score indicates greater base of one type of power. The data are averaged by departments, and the power indexes are given to the managers of respective departments.

**Managers Try to Use the Powers They Do Not Have**. Education and training can change managers' power bases in order to obtain desired results. There should be changes at the individual and organizational levels to make the enactment of power effective.

1. Training may be provided to managers so that they use coercive power to deal with inadequate performance of subordinates. There is no need to enhance coercive power base of managers.
2. Training may be provided to managers so that they learn how to provide various kinds of rewards to subordinates for their contributions to the organization. Employees are more likely to follow a leader's instructions if he or she provides rewards to subordinates contingent upon performance.
3. Supervisors can enhance legitimate power base if they provide instructions clearly, make sure that instructions are reasonable and appropriate, and explain their reasons for the instructions. Training can help supervisors to do just that, since subordinates may not carry out directives adequately if they believe the directives are unreasonable or unjustified.
4. Managers can improve legitimate power if they provide appropriate and timely information to employees so that they can perform their jobs adequately. Supervisory training on what type of information is need**ed** at what time by different subordinates should help to improve this power base.
5. Basic education, job-related training, and on-the-job training are essential for improving managers' expert power base. Managers should also be encouraged to enhance their skills through continuous self-learning. They will also need appropriate job experience to build on this power base.
6. Literature shows that referent power is more effective than other powers in influencing dependent variables. Although this power base has the most potential, referent power is probably used the least. Supervisors who have low referent power may be provided social intelligence training so that they learn to be empathetic to the subordinates' needs and feelings, treat them ethically, and with dignity, and present subordinates' concerns to upper-level managers when there is a need to do so. These strategies should enhance a supervisor's base of referent power.

   Appropriate reinforcement may be provided by organizations so that managers take initiative to enhance their understanding of the use of referent and expert powers. Of course, training may be of limited value when it comes to improving the referent power base. Organizations may have to adopt a policy of recruiting managers with social skills and charisma who are likely to bring adequate referent power.

**Enacting Wrong Types of Power to Deal with Different Situations**. Ineffective managers sometimes use wrong types of powers to deal with

various situations. The challenge managers face is to match the right power with a given situation so that desirable objectives are attained. In general position powers can be used to handle day-to-day problems, but complex problems cannot be used in dealing with the position powers. These problems can be only handled with the enactment of personal powers to obtain desirable outcomes.

Appropriate training can help managers understand and internalize how power bases can be enacted to enhance desirable results. Lectures, case studies, and simulations may be used to train managers to use powers effectively.

## Conclusion

Managers should know what kinds of power they have and how they can be used in different situations to attain objectives. Managers must learn to minimize the use of coercive power. The remaining position powers can be used to deal with day-to-day situations. Because the personal power bases mediate the relationship between the position powers and the desired results, the use of position powers will not be effective unless the managers have high personal powers. For dealing with complex problems, managers have to learn to use their personal power bases. Power bases, except coercive power base, can be used to enhance desired results provided that managers learn the complex relationships of position and personal powers to routine and strategic problems and challenges to obtain desired results.

# Managing Conflict in Organizations

Rafiqul Islam
Department of Peace and Conflict Studies, University of Dhaka, Dhaka, Bangladesh

## Synonyms

Battle; Clash; Contention; Contradiction; Controversy; Discord; Dispute; Strife; War

## Definition

Conflict in organization can be defined as a clash or struggle between individuals or groups that occurs because of incompatible behavior they expose for each other's positions, ideas, or interest.

## Introduction

Conflict is a common phenomenon in everyday life. Conflicts are experienced every day by both individuals and groups in any organization, society, state, or international arena. People always live and work with conflict in organizations (Fisher et al. 2000; Donohue and Kolt 1992). Conflict can take place at different levels of organization, including intrapersonal, interpersonal, intragroup, intergroup, and interorganizational levels. Individuals can be engaged in conflict in organizations for a variety of reasons, such as ideology, culture, personality, identity, power, prestige, status, and so on. While some conflicts are desirable in organizations, others are undesirable or highly avoidable. Again, some conflicts are easily manageable, others are hardly containable.

The purpose of this entry is to expound different types of conflicts confronted by individuals in organizations and examine the ways and means to resolve organizational conflicts. This entry is divided into two main sections. The first section begins with a brief discussion on the meaning of conflict, followed by discussion of different views and sources of conflict, respectively. The final section of the entry analyzes different levels of organizational conflict and strategies for managing conflicts in organizations, followed by a brief conclusion.

## Defining Conflict

The meaning of conflict varies from one context to another. Conflict can be viewed as a controversy or contradiction with any specific issue or problem. Conflict can arise from incompatible or inconsistent behavior between two or more individuals or groups of individuals on attaining the same goals or scarce resources. Conflict is also defined as a struggle between individuals or groups that occurs because of opposition they hold for each other's positions and ideas. Conflict can also arise from disagreement between individuals on any issue or problem (Crossman 2011). Any contradiction or confusion that arises in the minds of individuals can also give rise to a conflict.

Conflict can take place in organizations due to incompatible preferences or outcomes. For example, a goal conflict can emerge in an organization due to the gap between preferred or expected outcome perceived by manager and actual outcome or performance accomplished by the employees. Individuals in organizations can be engaged in conflict because of their incompatible thoughts and ideas on an issue or the work itself. People are also

involved in affective conflicts in organizations due to their incompatible or inconsistent feelings and/or emotions towards each other. Individuals in organizations are also engaged in conflict because of their inconsistent or incompatible views on the process of getting the work done in organizations (Hellriegel et al. 2000). This type of procedural conflict generally takes place in organizations between superior and subordinate or between management and labor union.

## Different Views on Conflict

Hellriegel et al. (2000) have explained three different views on conflict: (1) positive view, (2) negative view, and (3) balanced view. These three different views of conflict are briefly discussed as follows:

1. Positive View on Conflict

   The positive view of conflict holds that conflict in organization has positive consequences. From this perspective, it is believed that conflict in organization can give rise to creativity and innovation. This view also holds that the creation and/or resolution of conflict may generate constructive problem-solving activities. Positive conflict usually takes place in an organization when members of the organization are in disagreement for the attainment of common goals in which a new way of resolving the conflict is sought in collaborative manner. Hellriegel et al. (2000) have identified three categories of positive effects of conflict in organizations: (i) beneficial effects on productivity, (ii) relationship outcome, such as increase of sensitivity on others and developing better communication methods, and (iii) constructive organizational change, more effective control and better job description.
2. Negative View on Conflict

   The negative view on conflict holds that conflict may have serious negative consequences or effects on organization. Negative conflicts may occur in organization due to inequalities, discrimination, and injustice. Due to inequalities, discrimination, and/or intolerance, violent or destructive conflict takes place, which may cause the loss of lives of people or destruction of properties. In organizations, workplace violence takes place because of discrimination based on race, ethnicity, religion, culture, gender, and so on. In some situation where cooperation is required, if severe conflict and competition prevail, it may reduce performance.
3. Balanced View on Conflict

   The balanced view on conflict holds that conflict may be sometimes desirable and sometimes undesirable. This view also holds that some conflict should be avoided and others should be properly managed. The balanced conflict has consequences, ranging from negative outcomes (loss of skilled employees, sabotage, low quality of work, stress, and violence) to positive outcomes (creative alternatives, increased motivation and high quality of work, and personal satisfaction).

## Sources of Conflict

There are varied sources from which conflict arises. However, different sources from which conflict emanates include concern with self, different goals and resources, power, ideologies, varied norms, culture, relationship, and so on (Pareek 2013; Daft 1989). These sources of conflict are briefly discussed as follows:

Concern with Self

Individuals in a group within an organization are more likely to engage in conflict when their main concern is to serve their own interests. This type of self-interested conflict mainly arises when they have narrow perspective that results in a focus on short-term goals. This self-centered narrow perspective of individuals can be changed by creating a totalistic, long-term and broader perspective or mindset so that the interests of all can be served in a collective and collaborative manner.

Different Goals and Resources

Differential goals and resources can be an important source of conflict in organizations.

Intra- or intergroup conflict can arise from difficulties over the sharing of resources. When group members perceive the resources as scarce or limited, they tend to fight over who will receive what. However, beyond their individualistic orientation, if the people become capable of perceiving as expandable, the energy of the members can be used on effort to share and expand them. If the resources are not expandable they can be at least perceived as sharable.

Power and Status

Due to imbalance of power, conflict can take place between the parties. Power can be a basis of conflict in a group within an organization. Power is often viewed as limited like other resources. It is argued that in organizations, whether public or private, if the holder of power exercises absolute power and does not share it with other members it will create mistrust among others and give rise to conflict within organization. However, if the power holder shares it with other members, they will be empowered without reducing the power of the power holder. This power sharing initiative by the power holder in fact eliminates mistrusts from the members and helps increase everyone's power that brings about positive impact on organizations.

Ideologies

Ideological difference is an important source of conflict between individuals within organizations. In most organizations, management and workers are engaged in conflict because of ideological difference. This difference represents basic beliefs about the purpose and goals of organizations and the labor union (Daft 1989). However, organizations can only succeed, if members of the organization accept their ideological differences and work together to attain their common goals despite ideological differences (Pareek 2013).

Varied Norms and Culture

Conflict can arise from differences in culture and varied norms. In order for the organization to promote cultural harmony as well as productivity, cultural diversity must be valued and respected. Although many groups work towards uniform norms or standards of behavior, the demand for uniformity may lead to intolerance of differences. Since people from diverse cultures work together in organizations, conflict can take place due to differences in diverse cultures and norms. Again, uniform norms and standards of behavior can give rise to intolerance of differences. The intolerance of cultural differences can be minimized through promoting shared norms and values.

Relationship

Relationship is viewed as a source of conflict in organization. If the members of an organization trust each other and are very reliable upon one another, there is less likelihood that they will engage in conflict against each other. However, if the members are independent of each other and if their relationship is very hostile, they are more likely to engage in conflict with each other. Indeed, conflict in organization can be avoided or prevented by promoting a congenial relationship through building trust and integrity among the members.

Psychological Distance

In organization, conflict can take place due to psychological distance between management and workers. Workers often do not feel engaged in the organization when they perceive that their needs are not being met. This led them to satisfy their needs by joining a union. When the union is formed, the members' identity is merged with the union identity instead of the organizational identity and they try to achieve their gains through the union. This often throws the union and management into a win-lose conflict situation (Daft 1989).

## Levels of Organizational Conflict

Conflict in organization can take place at different communication levels. In general, there are five

basic levels of organization at which people may be engaged in conflict (Hellriegel et al. 2000; French et al. 2011):

1. Intrapersonal conflict (within an individual)
2. Interpersonal conflict (between individuals)
3. Intragroup conflict (within a group)
4. Intergroup conflict (between groups)
5. Interorganizational conflict (between organizations)

### Intrapersonal Conflict

Intrapersonal conflict refers to such type of conflict which occurs within an individual. Intrapersonal conflict generally involves some forms of goal, cognitive, or affective conflict. Inner tensions and frustrations often work within individual, which are responsible for causing intrapersonal conflict. For instance, conflict within an individual in choosing a job between/among different jobs is viewed as an intrapersonal conflict. Intrapersonal conflict may be of three main types: (i) approach-approach conflict, (ii) avoidance-avoidance conflict, and (iii) approach-avoidance conflict (Hellriegel et al. 2000; French et al. 2011). Approach-approach conflict refers to incompatible behavior of individual in choosing among two or more alternatives, each of which is expected to have positive outcome. For example, deciding to choose between a valued promotion in an organization and a desirable new job in another organization (Luthans 1981).

Avoidance-avoidance conflict refers to incompatible behavior of individual in choosing among two or more alternatives, each of which is expected to have negative consequences or outcomes. For example, relatively low pay in remote areas. Approach-avoidance conflict refers to incompatible behavior of an individual in choosing something that has both positive and negative consequences. For example, deciding in choosing a job that offers high salary but in a remote area (Hellriegel et al. 2000; French et al. 2011; also see Luthans 1981).

### Interpersonal Conflict

Interpersonal conflict refers to such type of conflict that occurs between two or more individuals who are in opposition to one another. Interpersonal conflict may be substantive or emotional in nature or both. Aggressive argument between two members of a selection committee over their preferences on the merit of hiring a job applicant is the example of a substantive interpersonal conflict, while disagreement between two persons on wearing office attire is an example of emotional interpersonal conflict. On the other hand, to be engaged in conflict over management style may be the example of both substantive and emotional interpersonal conflicts (French et al. 2011; Luthans 1981).

Many interpersonal conflicts are based on some type of role conflict or role ambiguity. A role is a cluster of tasks or behaviors that others expect a person to perform in doing a job. Role conflict refers to a focal person perceiving incompatible messages and pressures from the role senders. A role set is a group of role senders that directly affect the focal person. Role ambiguity is the uncertainty or lack of clarity surrounding expectations about a single role. Role ambiguity often causes stress and triggers coping behaviors (Hellriegel et al. 2000; also see Luthans 1981).

### Intragroup Conflict

Intragroup conflict refers to conflict that takes place between individuals within a group. Intragroup conflict can take place in a social, economic, or political organization. Conflict on a family-run business is the example of intragroup conflict (Hellriegel et al. 2000; French et al. 2011). Intragroup conflict can occur between the teammates in a football or cricket match on the issue of finding the best strategy to win the game. Similarly, disagreement between or among the students of a class over selection of a site for an excursion tour is also an example of intragroup conflict.

### Intergroup Conflict

Intergroup conflict refers to opposition or clashes between different groups, teams, or departments (French et al. 2011; Kreitner and Kinicki 2010). Intergroup conflict can occur due to a variety of reasons, such as work interdependence of the groups, goal differences, and perceptual differences between different groups within

organizations (Ivancevich et al. 2011). Intergroup conflict in organization can be of different categories, such as vertical conflict, horizontal conflict, line-staff conflict, and diversity-based conflict. Vertical conflict occurs between groups at different levels in an organization. Conflicts between superiors and subordinates or between management and workers are the examples of vertical conflict. Horizontal conflict takes place between different groups at the same level of hierarchy in an organization. For example, in a business firm, horizontal conflict can occur between management of sales department and production department due to imbalance between sales and production of goods. Likewise, intergroup conflict can take place between line and staff persons in an organization. Diversity-based conflict often takes place in different multicultural organizations based on race, ethnicity, religion, age, or gender (Hellriegel et al. 2000; also see French et al. 2011).

### Interorganizational Conflict

Another level of conflict in organization is interorganizational conflict that occurs between entire organizations or independent units in large organizations. In business arena, interorganizational conflict usually reflects the competition and rivalry between organizations operating in marketplaces. Interorganizational conflict may involve conflicts between multinational corporations and local entrepreneurs and conflict between government and NGOs (Hellriegel et al. 2000; French et al. 2011). In third world countries, different NGOs, including social and human rights organizations, are engaged in conflict with the governments. The creation of new organizational structures such as joint ventures, strategic alliances, and networks can help reduce conflict both between new partners and also within participating organizations.

## Strategies for Managing Conflict in Organizations

Although some conflicts may produce desirable outcomes in organizations, in most of the cases conflicts in organization produce negative consequences. These conflicts producing negative or devastating consequences need to be resolved or contained. While it is difficult to entirely eliminate conflicts, most of the conflicts in organization can be effectively managed or contained. Different scholars have suggested different methods or strategies for managing conflict in organization. K. W. Thomas (1976) has explained five different styles/strategies for managing conflict in organizations: (1) avoiding style, (2) forcing style, (3) accommodating style, (4) collaborating style, and (5) compromising style. These five conflict management strategies are briefly discussed as follows:

Avoiding Style/Method

The avoiding style refers to unassertive and uncooperative behaviors of individuals. An individual uses this conflict management style to stay away from conflict, ignore disagreement, or remain neutral. The avoiding style of conflict management reflects an aversion to tension and frustration and may involve decision to let a conflict work itself out. Individuals using the avoiding style receive unfavorable evaluation by others. In order for individuals to avoid conflict in organizations usually (i) follow rules and let others make decisions, (ii) do not take any controversial positions, and (iii) shun away topics that are sources of disputes. The avoiding style or strategy is desirable in three main situations: (1) when the issue is minor, (2) when individuals have insufficient information to effectively deal with conflict, and (3) when other individuals may be more effective to deal with/resolve the conflict (Hellriegel et al. 2000; Ivancevich et al. 2011).

Forcing/Dominating Style

The forcing style refers to assertive and uncooperative behavior of individuals. This method reflects a win-lose approach to managing interpersonal conflict in organization. The forcing style is also viewed as dominating approach. Individuals using the forcing style have very high concerns for self and no concern for others (Hellriegel et al. 2000; Ivancevich et al. 2011). Individuals using the

forcing or dominating style use force or dominance to resolve conflict. Dominating lends to be a power-oriented approach. According to Hampton et al. (1978), dominance may develop through individuals, coalitions, or majorities. Many creatures resolve conflict by individual force or dominance, based on fighting ability or physical dominance. In organizations, managers by dint of their formal authority can sometimes exercise dominance and dismiss one or more of the conflicting parties. Coalitions of two or more members in an organization can generate support to individuals against others. Again, a manager's decision by a majority consensus can exert adverse impact on the minority rights in an organization (Hampton et al. 1978).

The forcing or dominating approach is viewed as win-lose approach to conflict resolution (Hellriegel et al. 2000; Luthans 1981). An example of the forcing approach to conflict resolution/management is an individual insisting his/her position be accepted during disagreements. Top management in mechanistic or hierarchical system of organization usually uses this type of conflict management technique to resolve conflict in organizations. One of the advantages of using the forcing style is that individuals can take quicker decisions in resolving conflict.

Accommodating Style

The accommodating is just the opposite approach from dominance or forcing. The accommodating style refers to both cooperative and unassertive behaviors of individuals. According to this approach, accommodation may represent an unselfish act, a long-term strategy to encourage cooperation by others, or a submission to the wishes of others. An accommodating party or group places maximum emphasis on satisfying the needs of other groups (Hellriegel et al. 2000; Ivancevich et al. 2011). Accommodators are favorably evaluated by others but also perceived as weak and submissive. Using the accommodating style, conflict is best managed through the submission of personal goals to maintain good relations with those who are valued. Individuals have low concern for selves and high concern for others. To make others happy, individuals using this style choose to do all for it. Accommodating may be essential in some situations when preserving the peace and avoiding disharmony are more important than reaching a settlement maximizes a particular group's concerns (Ivancevich et al. 2011).

Collaborating Style

The collaborating style refers to strong cooperative and assertive behaviors of individuals. The collaborating style is viewed as a win-win approach to conflict management or resolution (Hellriegel et al. 2000). The collaborating style, sometimes called integrating or problem-solving approach attempts to resolve conflict by placing maximum emphasis on both groups' concerns or on maximizing joint results for both parties (Ivancevich et al. 2011). This style is more applicable under the following favorable conditions: (1) when conflict is viewed as neutral, helpful, and creative, (2) when conflicting parties exhibit trust in and candor with each other, and (3) when commitment of the conflicting parties becomes essential for satisfaction of all parties (Hellriegel et al. 2000).

Parties using collaborating or problem-solving method for managing or resolving conflict try to remove distrust from each other; share, examine, and assess the reasons for conflict; and then search for a solution for all. Since all parties are candid and trust each other, conflict is recognized openly and evaluated by all concerned. Conflicting parties using the collaborating approach often welcome new solutions through mutual discussion from a variety of viewpoints (Hellriegel et al. 2000; Ivancevich et al. 2011).

Compromising Style/Approach

Compromising is a traditional method for resolving interpersonal as well as intergroup

conflicts. The compromising style refers to behavior at an intermediate level of cooperation and assertiveness. The compromising strategy is established based on give and take approach to conflict management or resolution. The maxim of the compromising method is that in order for both parties to take something, they are also ready to give up something. For the parties to reach a compromise settlement, negotiations and/or mediations are also used as tools for conflict management/resolution. Individuals using compromising style try to find a fair combination of gains and losses for both parties (Hellriegel et al. 2000).

Compromising is a middle-of-the-road approach. It usually involves giving up more than forcing or dominating and less than accommodating. With compromise, there is no distinct winner or loser, and the resolution reached probably is not ideal for either group (Ivancevich et al. 2011). Compromising is also viewed as lose-lose approach to conflict management/resolution because no party wins and both parties lose something to settle the conflict (Luthans 1981).

Pondy (1967) has identified three major conceptual approaches to managing organizational conflicts: (i) bargaining approach, (ii) bureaucratic approach, and (iii) systems approach. The bargaining approach, according to Pondy (1967), deals with interest groups who compete against each other for limited resources. This strategy to resolve the conflict makes an attempt to either increase the pool of available resources or decrease the demand of the competing parties. The bargaining approach, which is also known as collective bargaining, is usually used in organization through negotiation of agreement between management and workers (Daft 1989). The bureaucratic approach to conflict deals with the vertical authority relationships in a hierarchical structure. According to this model, conflict takes place when superiors try to control subordinates and the subordinates resist such control. According to Pondy (1967), the strategy used to resolve the conflict, arising from such situation, is to alter impersonal bureaucratic rules for personal control (Luthans 1981).

While the bargaining model emphasizes the problems of competition and the bureaucratic model is concerned with the difficulties of control, systems approach says about the coordination problems. The systems approach deals with lateral or horizontal relationships between functions, such as marketing and production of an organization. According to Luthans (1981), two major strategies can be used to reduce functional conflict and attain coordination. The first strategy is to reduce goal differentiation by modified incentive or by proper selection, training, or assessment procedures. The second strategy is to reduce functional interdependence by reducing dependence on common resources by reducing pressure for consensus and by loosening up schedules, or introducing buffers, such as inventories or contingency funds (Luthans 1981).

Team building is also used as a strategy to resolve worker-management conflict in organizations. Each group, forming a team of about 10–12 members, may make a solution to a problem. The representative from each team or group may be used to negotiate with the representative of the competing group. In this process, a mutually agreed upon solution can be sought to resolve the conflict. Gain sharing is also viewed as a strategy for resolving conflict in organization. Gain sharing provides a connection between organization performance and employee compensation through a paid annual bonus. Employee security can be also viewed as a conflict management strategy in that both management and workers create a "common fate" culture that means they succeed or fail together (Daft 1989).

## Conclusion

In sum, conflict is inevitable in every organization whether small or large. Individuals or groups can confront conflict at different levels of

organization, such as intrapersonal, interpersonal, intragroup, intergroup, and interorganizational levels. Intrapersonal conflict generally occurs due to inner tensions and frustrations within individuals. Interpersonal conflict, on the other hand, takes place between two or more individuals who are in opposition to one another. Intragroup conflict, however, occurs between different individuals within a group, while intergroup conflict occurs between two or more groups of individuals in an organization. Interorganizational conflicts usually occur between different organizations or independent units of large organizations.

Conflict in organization can arise from a variety of sources, some of which include concern with self, different goals and resources, power and status, ideologies, varied norms and culture, relationship, and psychological distance. Based on the types, sources, and levels of conflicts as well as the nature and complexity of organization, the strategies for managing and/or resolving conflict in organization can vary. The avoiding strategy reflects the unassertive and uncooperative behavior of individuals. Individuals using the withdrawal or avoiding strategy/style usually withdraw or stay away from conflict. As the forcing or dominating approach//strategy reflects assertive and uncooperative behavior of individuals, individuals using the forcing or dominating style exert force or coercion for resolving conflict in organizations. The forcing or dominating strategy for managing conflict is used in hierarchical or mechanical organizations. The accommodating strategy is opposite from the forcing/dominating approach, because individuals being holder of unassertive behavior sacrifice their own needs for satisfying the needs of other individuals.

The collaborating/integrating strategy, which is viewed as "win-win" approach to conflict management attempts to resolve conflict by maximizing joint results for both parties. Since the collaborative strategy emphasizes the participation and cooperation of conflicting parties to resolve conflict, it is more efficacious and effective in complex or organic organizations in which the integration of all parties are highly required for the attainment of common goals of the organizations. While the collaborating strategy is viewed as "win-win" approach to conflict management, the compromising strategy is based on the maxim of "give and take" in that both parties are ready to give up something in order for them to take something. Finally, given the above discussions, it can be asserted that the efficacy and effectiveness of different conflict management strategies are contingent upon different circumstances and/or situations.

## Synonyms

Caribbean; Discrimination; Diversity; Equality; Gender; Legislation; Race; Sexual orientation

## Definition

This entry is intended to examine diversity, evaluate the challenges and benefits of managing a diverse workforce, and explore the realities of diversity within the Caribbean context.

## Introduction

Within the organizational context, the concept of diversity management focuses on facilitating an understanding of employee differences. This is with a view of equipping managers with the requisite skills to effectively manage employees, thus ensuring that their optimum level of productivity is realized (Armstrong et al. 2010; Olsen and Martins 2012). Diversity may be categorised as surface level (e.g. race, age and sex) and deep level diversity (e.g. experiences, preferences, and values) (Avery and McKay 2010; Joshi and Roh 2009; Phillips and Loyd 2006). Internationally, due to migration and changing demographics, globalization, and international mergers (Olsen and Martins 2012; White 2009), societies and by extension the available labor pool are also becoming more diverse. Therefore, a key consideration for organizations is the extent to which its pervading culture is one where homogeneity is preferred or heterogeneity is embraced. Research suggests that there are benefits (increased profitability and an enhanced competitive advantage) associated with diversity (Guillaume et al. 2013; Tyran and Gibson 2008; Van Der Vegt et al. 2005); thus, organizations which resist the inclusion of diverse employees may do so at their peril.

In the Caribbean region, as it relates to race, given the history of slavery and indentured labor, there remain some latent hostilities among the racial groups which comprise the populace, which in turn gives rise to, on occasion, discrimination on the basis of race, particularly between those persons of African and Indian descent. As it relates to sexual orientation, with buggery laws still in place in many Caribbean islands (a remnant of colonial laws), discrimination against homosexuals continues, with no legal recourse available to those adversely affected. On the contrary, those persons who have been charged and found guilty of violating the buggery legislation may be imprisoned or subjected to capital punishment. Turning to gender differences, there is evidence to suggest that in the Caribbean, women are treated less favorably than men particularly in the workplace vis-à-vis remuneration and career progression.

In this entry, we will discuss diversity and diversity management, critically assess the findings of the existing literature as it relates to the benefits and challenges of diversity to organizations and the extent to which there are contextual factors which are likely to mediate the impact of organizational diversity efforts, and analyze the extent to which antidiscrimination legislation has had an impact on organizational diversity and diversity management within the Caribbean.

## Diversity Management

Arguments in favor of diversity are pervasive throughout the literature and include increased adaptability, access to a wide range of skills experience and perspectives, and greater appeal to a more diverse range of clients less absenteeism and more customer satisfaction (McKay et al. 2011; Van Knippenberg and Schippers 2007). However, just as ubiquitous in the

literature are suggestions that these purported advantages are not always realized. Indeed, there are a number of challenges which organizations face when trying to become more diverse, including increased levels of conflict, ineffective communication, preference for homogeneity, and discrimination (see Stephenson and Lewin 1996). According to the research undertaken by Phillips and Loyd (2006), the expectations of the realization of the multiple benefits of diversity imply that simply by virtue of their differences, an individual may add value to the organization, which has not been proven to be representative of reality. Arguably, this further implies that homogeneous groups of employees are not as effective as diverse groups, which similarly has not been supported by research. Nevertheless, acceptance of these assertions by organizations could result in unrealistic expectations of managers from their employees and exaggerate the expected contribution of one group(s) when compared to the other (Phillips and Loyd 2006).

The extent to which an organization realizes the benefits from diversity is contingent upon the support for diversity at all levels of the organization, i.e., operational as well as the various supervisory and management levels and the extent to which the organizations' policies and practices are equitably and consistently applied (Armstrong et al. 2010). Even where a systematic strategy is implemented to embrace diversity, there is no absolute guarantee of success, particularly where the organization is largely homogeneous and the extant culture supports excluding employees who are different and wide-ranging organizational change is necessary (Gonzalez 2010). There is a paucity of research in relation to the effectiveness of diversity programs (Guillaume et al. 2013); notwithstanding this, research by Armstrong et al. (2010) suggests that managers can take action to include and effectively manage diverse human resources; this may involve developing effective diversity/equality management programs in the organization, increasing organizational support for diversity through the use of diversity champions, providing training where required and adapting the organization's strategy where possible to clearly delineate support for diversity and fair and transparent diversity efforts, and monitoring and evaluating diversity efforts on an ongoing basis (Armstrong et al. 2010).

The concept of diversity is associated with discrimination. Where individuals believe that one group of people is different from themselves in some way, they often rely on stereotypes to assess their behavior, likely responses, level of expected productivity, and performance. The reliance on stereotypes while convenient means that all persons within a single group (however defined) are treated as homogeneous, rather than considered an individual (Kirton and Greene 2010). Internationally, some countries have enacted legislation which prohibit discrimination and promote equality in a wide range of areas including employment. The burden of identifying incidences of discrimination and/or inequitable treatment in organizations, however, rests primarily with the employee, who must also support any claims of discrimination with evidence. While the penalties for legislative breaches are generally monetary in nature, they are not typically so onerous that they act as a deterrent where organizations are determined not to make cultural and organizational changes to ensure they are in compliance. Importantly, anti-discriminatory legislation (e.g., the UK's Equality Act 2010) does not equate to requiring diversity in organizations, and legislation may allow for some exceptions to the requirement of nondiscrimination, thereby providing the organizations with a loophole on which they can rely.

The Caribbean region is heterogeneous as it relates to race, age, religion, sex, and sexual orientation (inter alia). The right to nondiscriminatory treatment is enshrined within the constitution of the island states in the Caribbean Region. However, the language contained therein focuses generally on the protection of human rights. Notwithstanding this, there are three island states (in the English-speaking Caribbean), namely, Guyana, St. Lucia, and the Republic of Trinidad and Tobago, which have enacted specific legislation to make unlawful,

specific grounds of discrimination. While discrimination may be perpetuated on various grounds including but not limited to age, race, sexual orientation, religion/belief, disability, and gender, it appears to be more prevalent in the Caribbean region on the grounds of race, sexual orientation, and gender.

## Racial Diversity in the Region

The social, cultural, and ethnic diversity of the islands of the Caribbean are influenced by their colonial history and its influential role on the social, economic, and political development in the region. This in turn has had an impact on whether and the extent to which there are problems of discrimination and equality in the West Indies. Trinidad and Tobago is the Caribbean's most ethnically diverse society, where the dominant ethnic groups are Afro-Trinidadians and Indo-Trinidadians; however, the population also consists of persons of Chinese, European, and Middle Eastern extraction. Guyana's primary ethnic groups consist of persons of East Indian, African, and to a lesser extent Amerindian descent. St. Lucia's population consists primarily of persons of African descent; however, there are also those citizens of East Indian descent and mixed race.

As it relates to race, given the history of slavery and indentured labor within the Caribbean, there remain some latent hostilities among the racial groups which comprise the populace, which in turn gives rise, on occasion, to discrimination on the basis of race, particularly between those persons of African and Indian descent. The racial composition of these islands is consistent with the other English-speaking islands in the region and reflects the demography which existed post-slavery, during the colonial period. Along with the introduction of different races came different cultures and religions; thus, the islands evolved into a community which was and remains diverse in terms of religious groups as well including but not limited to Roman Catholic, protestant Christians, Hindu, Muslim, and other nontraditional groups.

## The Question of Sexual Orientation in the Caribbean

Turning now to sexual orientation, within the English-speaking Caribbean, there are several islands where homosexuality is against the law (namely, Antigua and Barbuda, Barbados, Belize, Dominica, Grenada, Guyana, Jamaica, St. Kitts and Nevis, St. Lucia; St. Vincent and the Grenadines). In these islands, persons found to be in violation of the relevant legislation may face custodial sentences or capital punishment. For example, in Trinidad, the Sexual Offenses Act (1986) criminalizes homosexuality, and those found guilty of breaking the law may face terms of imprisonment which range from 5 years (if the act is committed by a minor), to 25 years (if the act is committed by an adult on another adult), to life (if the act is committed by an adult on a minor). Similarly, the St. Lucia Criminal Code (2004) and the Criminal Law (Offences) Act of Guyana (1998) prohibit buggery, and persons found guilty may be faced with up to a 10-year term of imprisonment or a life sentence if the act is committed by force and without consent. In effect, these laws criminalize private consensual acts between adults. Notwithstanding this, across many Caribbean islands, once sexual behavior is kept private, criminal prosecution is unlikely. Indeed, police officers neither routinely nor actively seek out persons practicing homosexuality in order to prosecute them. However, where sexually prohibited behavior is openly practiced, it is perceived as an attempt to corrupt public morals and displays of public outrage by offended citizens, likely. As a consequence, these citizens may make a complaint to the police, subsequent to which, law enforcement officers are obligated to investigate and take action against the offending party.

In many Caribbean islands, such outrage results from religious beliefs. Those who subscribe to a homosexual lifestyle are stigmatized within society, and there are many anecdotal examples of harassment and discrimination and other forms of maltreatment of homosexuals vis-à-vis access to employment, housing, health care, and other social services. Many of the existing nongovernmental organizations (NGOs)

and lesbian, gay, bisexual, and transgender (LGBT) groups across the Caribbean have lobbied their respective governments (without success) to amend or repeal the sexual offenses legislation and to include nondiscrimination on the basis of sexual orientation in the equality legislation (where it exists) or to develop a wide-ranging anti-discrimination legislation.

## Discrimination on the Basis of Gender

Across the Caribbean, women account for more than 50% of population; thus, there is a need for their increased representation and participation at all decision-making levels of society. While legislation to ensure equality of opportunity and treatment in employment exists, it is often not actioned, and the violation of women's rights within the workplace persists, especially among those from the lower socioeconomic bracket. All existing legislation promoting equality between women and men must be supported by constant campaigning to raise awareness of the existence of such legislation and by encouraging dialogue with and between men and women. In Caribbean where functional democracy obtains, the emphasis is on inclusion of all groups of persons in the development process, working on the basis of popular consent and participation, legitimacy, and accountability of those who govern and responding to the actual needs and interests of the public. This in turn will contribute to the achievement of a more egalitarian society, where the rights of both women and men are regarded as important and ultimately the further development of the region. The United Nations Women's Convention has been signed and ratified by most Caribbean member states. The Convention compels signatories to take appropriate measures to eliminate discrimination against women, in both the private and public sector. In an attempt to redress the balance in terms of remuneration, some Caribbean islands have also implemented equal pay legislation. These include Antigua and Barbuda, Dominica, St. Vincent and the Grenadines, and Jamaica.

## Anti-discrimination Legislation in the Caribbean

As relatively new laws, the extent to which anti-discrimination legislation in the Caribbean has been effective in eliminating or reducing the incidence of discrimination has not been assessed. However, the laws are essentially self-enforcing, in that claimants must take the initiative to report the prohibited action and provide evidence in support of their claims. To support their efficacy and to ensure the laws function as a catalyst for change, legislators must be aware that compliance is likely to be achieved through enforcement, education, and the provision of legal guidance (e.g., through the court adjudications and tribunal decisions) and the development of a culture within the workplace and society which does not accept discrimination on any grounds (Havinga 2002; Loretto and White 2006). The prohibited grounds of discrimination based on the current anti-discrimination legislation in the Caribbean are as follows:

- Trinidad's Equal Opportunity Act 2000, prohibits discrimination within employment, vocational training, accommodation, education, provision of goods and services on the grounds of sex, race, ethnicity, and origin including geographical origin, religion, marital status, and disability.
- Guyana's Prevention of Discrimination Act 1997, prohibits discrimination in employment, training, recruitment, and membership or professional bodies. The protected grounds of discrimination are race, sex, religion, color, ethnic origin, indigenous population, national extraction, social origin, economic status, political opinion, disability, family responsibilities, pregnancy, marital status, and age.
- St. Lucia's Equality of Opportunity and Treatment in Employment and Occupation Act 2000, provides legal protection against discrimination in the workplace on the grounds of race, sex, religion, color, ethnic origin, family responsibilities, pregnancy, marital status, or age.

For each of these Acts, the burden of proof lies with the complainant, who must prove that the responding party has a prima facie case of discrimination to answer. Moreover, legal exceptions may weaken efforts toward nondiscrimination, inclusion, and diversity (Dickens 2007). The primary exception upon which these laws turn is permitting discrimination in employment, where the grounds of discrimination are found to be a genuine and determining occupational requirement (GDOR). In practice, this exception means that where either the employee or applicant fails to meet this requirement, or the employer is not satisfied that it is met, discrimination is permissible. In effect, such exceptions may offer legitimacy to discrimination and as such stymie compliance objectives (Hornstein et al. 2001; Sargeant 2006). Consequently, instead of pursuing inclusive and nondiscriminatory employment practices, where determined to do so, employers may persist in treating persons differently while utilizing and relying on the exception of "genuine and determining occupational requirements." Moreover, Gagnon and Cornelius (2000) suggest that legal approaches adopted to address discrimination and promote diversity are limited in the extent to which they can effect equality and inclusion because they do not require a commitment from organizations to pursue nondiscrimination. Indeed, significant and sustainable organizational change would arguably require a change in culture which is beyond the scope of the legislation. One further way which has been suggested for enhancing legislative effectiveness is through the means of amendments to the legislation with a view of addressing evident shortcomings and to increasing the scope of employment practices where discrimination is prohibited (Dickens and Hall 2006).

## Conclusion

Across the English-speaking Caribbean, anti-discrimination legislation is not widespread, with currently only three island states having enacted such legislation, namely, Trinidad and Tobago, Guyana, and St. Lucia. Yet still there are other Caribbean islands where the discrimination legislation is in the discussion phase as is the case, for example, in Barbados, where discussion white papers on legislation prohibiting discrimination on the basis of age and disability have been tabled in parliament. To this end, the government has declared its commitment to reviewing existing legislation and amending or developing further legislation to eliminate discrimination and promote equality of opportunity for persons with disabilities and age.

However, questions remain over the inequality and inconsistency of a system which retains laws criminalizing the private behavior of persons in the LGBT community while offering protection from discrimination on other grounds. The legislative framework provides a procedural right of individual complaint on specific grounds in specific circumstances, rather than a positive right to freedom from discrimination. It may be argued that the numerous exceptions and exemptions created weaken both the strength of the law as a tool for litigating rights as it does as an advocacy tool for articulating equality norms.

# Managing Homeland Security

Jeremy Plant
Penn State Harrisburg, Middletown, PA, USA

## Synonyms

Counterterrorism; Cybersecurity; Managing risk; Network organization and management; Threats and vulnerabilities

The terrorist attacks of September 11, 2001 exposed not only the vulnerability of the US homeland to catastrophic acts of terrorism but also the need to define what is meant by homeland security, to build institutions to counter threats, and to plan an effective strategy to manage homeland security activities.

What do we mean by "homeland security?" Is there a shared definition, a common meaning for the term, which exploded on the nation's consciousness with the attacks on the World Trade Center and the Pentagon that September day? In the wake of the first major terrorist attacks on US soil, most definitions focused almost solely on terrorism. The USA PATRIOT Act (Public Law 107-56), hastily drawn in the first month after 9/11, focused on ways in which law enforcement agencies could gather information on and detain suspected terrorists. Even as the Department of Homeland Security was charged with responsibilities for natural and non-terror-based human-caused disasters, the central focus on terrorism was seen by most as the defining mission of homeland security. As late as 2007, two years after the catastrophic damage to the Gulf Coast inflicted by Hurricane Katrina, homeland security was defined in the National Strategy for Homeland Security as "a concerted national effort to prevent terrorist attacks within the United States, reduce America's vulnerability to terrorism, and minimize the damage and recover from attacks that do occur." More recently, the definition has been expanded to consider all hazards. For example, the 2010 Quadrennial Homeland Security Review (QHSR), which will be examined in detail

below, utilized a definition of homeland security as "a concerted national effort to ensure a homeland that is safe, secure, and resilient against terrorism and other hazards where American interests, aspirations, and way of life can thrive."

Two models were posited in the immediate aftermath of the 9/11 attacks: an Office of Homeland Security in the Executive Office of the Presidency, to coordinate efforts across the executive branch of government, and a new Department of Homeland Security, to bring under one umbrella the cluster of administrative units engaged in homeland security activities scattered across existing departments or enjoying independent agency status. President Bush favored the White House-based coordinating office and created the Office of Homeland Security with former Pennsylvania governor Tom Ridge on October 8, 2001, by Executive Order 13228. The order also established the Homeland Security Council to develop an overall approach to homeland security. Leaders in Congress, however, felt that a new department was needed, both to provide better coordination and cooperation among the plethora of agencies involved in homeland security operations and to be more accountable than a White House staff operation to the legislative branch. After a good deal of negotiations, the Department of Homeland Security (DHS) was established through passage of the Homeland Security Act of 2002 (P. L. 107-296) on November 25, 2002. This statute and subsequent presidential directives and legislation have provided the legal and administrative basis of the nation's approach to the new and daunting field of homeland security.

Managing homeland security is, arguably, the most difficult administrative task in US governance. It involves managing the third largest executive department, cobbled together in a short time frame to meet the requirements of the Homeland Security Act. Legislation and executive orders have charged the department with direct management of airline security, including the large body of workers needed to screen passengers and luggage. They require DHS management to assess risks, threats, and vulnerabilities across a wide spectrum of potential calamities, including natural as well as man-made disasters, accidents as well as planned terrorist attacks, and even pandemics and health-related threats. They put DHS at the center of a vast network of public and private sector entities, providing and sharing information on a real-time basis across the range of possible events. They mandate careful planning and risk assessment with a limited amount of empirical data to draw from and zero margin for error. At the core of homeland security is the management and flow of information, derived from average citizens witnessing suspicious behavior up to sophisticated intelligence activities requiring top-secret clearance and security.

Given the complexity and enormity of the homeland security enterprise, it is not surprising that criticism of DHS has been widespread. DHS is often among the lowest-rated executive units in terms of effectiveness and employee morale. Over a decade after its creation, DHS still lacks a shared headquarters campus, with its components scattered across the Washington region in mostly leased office space. It has been criticized as being more reactive than proactive; as being slow in producing plans and other products required by statute or presidential directive; and as lacking good internal management, including the ability to show how its budget reflects a clear set of policy priorities. The Gulf of Mexico hurricanes in 2005 exposed the administrative shortcomings of the Federal Emergency Management Agency (FEMA) and raised serious questions of how emergency response best fit into the structure and culture of DHS.

On the bright side, though, one can point out the absence of significant terrorist activity since 2001, the foiling of several terrorist attempts, and the building of a functioning network of state, local, nonprofit, business, and federal organizations that on a daily basis share an enormous amount and variety of information. Leadership of DHS at the top levels has generally been strong and stable over both a Republican and Democratic administration.

As we move through the second decade since the emergence of homeland security as a major component of public policy and administration, two management issues seem to dominate. First, how can the structure and internal management

approach of DHS continue to evolve in ways that enhance its mission; and second, how can the overall homeland security enterprise, the network of involved governmental and private organizations, remain effective as some threats and vulnerabilities wane and others (the most notable of late being cyber security) become more salient given external forces. The two challenges, to be sure, are interconnected and complementary: DHS needs the network of partners to do its job, and the network needs a central player, DHS, to coordinate and lead. In this sense, managing homeland security exemplifies what contemporary public management scholars see as the two poles of governance: network governance and the management of agile, effective, adaptive organizations.

## Managing the Department of Homeland Security

The Homeland Security Act of 2002 mandated the transfer of 22 agencies and over 100 organizational subunits to the new Department of Homeland Security. Melding such a diverse set of organizations into some degree of cohesion was the first order of business for DHS's top leadership, Tom Ridge and Admiral James Loy, Ridge's Deputy Secretary. Admiral Loy was chosen to lead the effort to organize the internal operations of DHS. He was a logical choice, having been the top official at two of the major components of the new department, the US Coast Guard (USCG) and the newly formed Transportation Security Agency (TSA). Loy based his management philosophy on "values-based leadership" and worked to develop a sense of shared values within DHS. Despite the urgency with which DHS had been created, the first years of DHS saw no repeat of the catastrophic events that had led to its formation, allowing the new department to gradually gain ground it its efforts to become an integrated entity.

The first major reorganization of DHS occurred under Secretary Michael Chertoff, Ridge's successor, in July 2005. The goal of the reorganization was to achieve better operational efficiencies and to focus the department more on risk analysis and develop policies based on the risk-based approach favored by the Secretary. Much of the reorganization focused on headquarters' activities and included the formation of a new Directorate of Policy (renamed Office of Policy in 2007), the Office of Intelligence and Analysis, the Operations Coordination Office, the Directorate for Preparedness, and the movement of FEMA from the Emergency Preparedness and Response Directorate (the predecessor of the newly formed Directorate for Preparedness) with some of its functions moved to other units of DHS.

Later in 2005, Hurricane Katrina, the worst natural disaster in decades, revealed weaknesses both in DHS's structure and the network of first responders charged with immediate action in the wake of catastrophic events. It also showed how the initial focus on terrorism had made the department ill-equipped to deal with other sorts of hazards. FEMA, which had been a professionally led independent agency in the Clinton Administration, was buried deep within the organizational structure of DHS and led by patronage appointees ill-equipped to handle a crisis of this magnitude. To address the perceived deficiencies of Katrina, Congress passed the Post-Katrina Emergency Management Reform Act (PKEMRA) of 2006 (P. L. 109-295). The act strengthened the emergency management aspects of DHS by adding subunits to FEMA and creating the Office of Health Affairs, led by the Assistant Secretary for Health Affairs and Chief Medical Officer.

The Obama Administration made no fundamental changes in the structure of DHS. The current structure of DHS is shown below. It includes seven major line agencies that deliver services directly and interface with the public in highly visible roles:

- US Customs and Border Protection (CBP)
- US Coast Guard (USCG)
- US Citizenship and Immigration Services (USCIS)
- Federal Emergency Management Agency (FEMA)

- US Immigration and Customs Enforcement (ICE)
- US Secret Service
- Transportation Security Administration (TSA)

The other major subunits within the department serve largely in headquarters' functions, assisting the Secretary and Deputy Secretary in developing policy, working with key stakeholders, and insuring compliance with law and regulations. The key unit in providing management direction for the department is the Directorate of Management. The unit is led by the Under Secretary for Management, the third highest ranking individual in the department. Reporting to the Under Secretary are the Chief Financial Officer, Chief Communications Officer, Chief Information Officer, Chief Readiness Support Officer, and Chief Security Officer. The goals of the directorate are to integrate the management function with DHS, improve customer service, and sustain financial stewardship. As noted below, developing a sense of integration of management functions has been and remains a critical challenge for DHS.

One challenge for top DHS management has been the physical scattering of DHS offices in over 50 locations around the Washington metro area. The headquarters of DHS is in Northwest Washington, far from other federal departments, in a rather inauspicious collection of low buildings near American University. An ambitious plan to create a headquarters campus in Southeast Washington at the site of the historic St. Elizabeth Hospital is still uncompleted, with only the headquarters building of the Coast Guard in place at the time of this writing. First proposed in 2006 with a price tag of $4.5 billion, the project has been scaled down to $2.4 billion, but even with reduction it will be the largest construction project ever for the General Services Administration. The plan is to consolidate over 14,000 DHS employees in over 50 buildings at the site across from Reagan National Airport. The timetable now aims at completion sometime in the 2020s. Without such a central location, the continuing efforts of DHS leadership to create a sense of unity within the department seem destined to fall short of the mark.

## Mission-Based Management

All federal agencies are required to develop mission-based strategies under the Government Performance Results Act (GPRA) of 1993 and the updated GPRA Modernization Act of 2010 (P. L. 111-352). For DHS, however, an additional requirement was added after passage of the Implementing the 9/11 Commission Act of 2007 (P. L. 107-296). DHS was charged with preparing a comprehensive review of its priorities, goals, and operations every 4 years in a Quadrennial Homeland Security Review (QHSR). The QHSR exercise was seen by its promoters as a way of engaging all units of DHS and its partners in providing a strategic view of the overall homeland security enterprise.

The first such QHSR was promulgated by DHS in February 2010. As noted in the Preface by Secretary Janet Napolitano, the document was meant to be a "strategic analysis" of what the report termed "the homeland security enterprise" – the entire network of federal, state, local, tribal, and territorial governments, the private and nonprofit sectors, and the citizenry. It reflected Congress's concern that the most basic questions regarding homeland security remained unclear; in the words of the QHSR, these include "What is homeland security?", "How is the homeland best made secure?", and "What does it mean to be prepared?".

As noted above, the 2010 QHSR provided a new definition for homeland security that included all hazards, not just terrorism. Building on this broader view of homeland security, the 2010 QHSR identified five missions for DHS and the homeland security enterprise as a whole:

- Preventing Terrorism and Enhancing Security
- Securing and Managing Our Borders
- Enforcing and Administering Our Immigration Laws
- Safeguarding and Securing Cyberspace
- Ensuring Resilience to Disasters

Secretary Napolitano made clear in the review that it did not lay out a blueprint for the internal management of DHS, or to relate priorities to

resources, but was instead a first step in laying out a clear mission for the nation's homeland security enterprise. The statutory requirements of the QHSRs, however, clearly require the identification of a "budget plan required to provide sufficient resources to successfully execute the full range of missions called for in the national security strategy" described in the review (U. S. Department of Homeland Security 2010, pp. iii–iv).

The second QHSR was issued on June 18, 2014. Compared to the 2010 QHSR, the 2014 review reflected a concern less to redefine the mission of DHS or the meaning of homeland security than to address management issues within DHS and the networks engaged in homeland security activities. In the words of Secretary Jeh Johnson, who took over the leadership of DHS on December 23, 2013,

> This report provides a strong analytic and strategic foundation for one of my highest priorities, which is ensuring that the Department invests and operates in a cohesive, unified fashion and makes decisions that strengthen Departmental unity of effort." Secretary Johnson went on to note that "to support priority security requirements in a sustainable way, a corollary responsibility for DHS is to become more efficient and effective across a large and decentralized structure. As a Department, we must eliminate duplicative processes, develop common platforms, and purchase single solutions, while pursuing important commitments. . .DHS must and will also address the low morale that exists within many of its components. (US Department of Homeland Security 2014, p. 3)

The five basic missions identified in the 2010 QHSR were retained in the QHSR, as was the operational definition of homeland security. However, the FY 14-18 Strategic Plan modified the list somewhat, with five major strategies showing some changes based on the growing salience of cyber security and biological threats:

- Securing against evolving terrorist threats
- Safeguarding and securing cyberspace
- Countering biological threats and hazards
- Securing and managing flows of people and goods
- Strengthening homeland security through better public/private partnerships

The QHSR exercises have been complemented by PPD-8, National Preparedness, issued in 2011. This presidential directive charged DHS with the development of the National Preparedness Goal, the National Preparedness System, the National Planning Frameworks, the National Preparedness Report, and the Federal Interagency Operational Plans. It directs DHS to build and improve the capabilities necessary to prevent, protect against, mitigate the effects of, respond to, and recover from those threats that pose the greatest risk to the security of the nation.

Perhaps the most significant result of the QHSR exercises and PPD-8 has been moving the management focus of DHS away from a concern primarily with the organization of the department to a focus more on the network of organizations that make up the overall homeland security enterprise. Although DHS from its inception has worked closely with other players in homeland security, it took the maturation of the department and a consensus that its overall organizational structure was appropriate for its mission to move to a greater focus on its relationships with outside agencies and organizations.

## The Homeland Security Enterprise: Managing Networks

DHS has been designated the principal organization in the United States to manage homeland security programs and activities, but to achieve its goals, it must work in partnership with other federal agencies, state, and local governments, business and nonprofit organizations, counterpart agencies in other nations, and the citizenry of the United States. This is the notion of the homeland security enterprise, which was instituted with the establishment of the National Incident Management System (NIMS) at the formation of DHS and which has been reinforced in the QHSRs and strategic plans of DHS. Two statistics help illustrate the need to employ the network concept to homeland security. First, in FY 2014, a little over half of federal funding for homeland security-related programs went not to DHS but to other federal agencies; DHS received roughly 49%. Second, in the area

of critical infrastructure protection, a key aspect of the enterprise, over 80% of assets identified as critical to the nation's security are owned by the private sector, including virtually all transportation systems, the power grid, agricultural assets, and other sectors of the economy.

Network management has moved to the forefront of public management theory and practice as government has devolved responsibilities to state and local governments, created partnerships with businesses and nonprofit organizations, contracted for services, and developed intergovernmental relations with state and local governments. Given the urgency of the immediate post-9/11 environment, it was inevitable that partnering with other levels of government and private stakeholders was essential. Over time, these relationships have matured and stabilized through the flow of information, shared training and planning exercises, and responses to catastrophic events such as hurricanes, the Deepwater Horizon oil spill in the Gulf of Mexico in 2010, and the Boston Marathon bombing in 2013.

The Department has recognized the need to create formal councils and panels to connect with key stakeholders. One important example is in the area of infrastructure security. With so much of the nation's critical infrastructure and key resources owned and operated by the private sector, effective network arrangements are key to protecting these assets from both man-made and natural disasters. This is accomplished by connecting DHS to other parts of the enterprise through the National Infrastructure Advisory Council and the Critical Infrastructure Partnership Advisory Council, both of which provide valuable input from public and private organizations managing or operating critical infrastructure and key resources. The National Infrastructure Protection Plan (NIPP) promulgated in 2006 provides the basis for continuing relationships in 11 specific sectors of infrastructure. To achieve coordination and to share information in each sector, several types of network activities have been established: information sharing and analysis centers (ISACs), Critical Infrastructure and Key Resources Coordinating Councils, and Critical Infrastructure and Key Resources Government Coordinating Councils, which identify the federal departments and agencies designated as the Sector-Specific Agency (SSA) with lead responsibility for a given sector.

Below the national level, every state and territory has created a homeland security organization reporting to the governor. Three models are currently utilized: an agency within another state department or agency, a stand-alone homeland security agency, and an entity within the governor's office. Their primary job is to develop statewide preparedness plans and to insure coordination in case of catastrophic events and to be the conduit for grants from DHS. A key player in each state is the state's designated homeland security advisor. At DHS, the Office of Intergovernmental Affairs is the principal point at which the department connects with subnational government entities.

A specific management tool at the subnational level is the fusion center. Fusion centers are managed by state and local governments to "fuse" information from a variety of sources – criminal justice data, information on emergency management activities, and health data – to prevent all sorts of catastrophic events. They have been utilized most often to engage police units with the potential for terrorist threats.

The network approach is largely a means of sharing information among the myriad of players in the homeland security enterprise. One such activity is the National Terrorism Advisory System, which replaced the much-derided color-coded alert system instituted in the first years of DHS. The NTAS alerts are categorized in two levels: elevated alert, which warns of a credible terrorism threat against the Unites States, and imminent alert, warning of a credible and specific impending threat. A bulletin is issued daily by NTAS, with information on how to report possible threats and the duration of the current threat alert.

## Conclusion: Challenges Facing the Homeland Security Enterprise

In 2017 a new presidential administration became the third to address proper management

of the homeland security enterprise. The Trump administration has promised significant changes in policies entrusted to DHS to administer, most notably in border and immigration enforcement activities. It is less clear whether the new leadership of DHS intends to institute major changes to the structure and mission of DHS. DHS Secretary John F. Kelly has made clear that the administration intends to move forward with plans to expand the REAL ID program and oppose court rulings limiting the department's ability to restrict or more closely monitor entry to the United States from countries seen as supporting or harboring terrorist (US Department of Homeland Security 2017). It seems unlikely that the federal role will expand to the extent that it overwhelms the network approach to working with its partners in state and local government, but at the time of this writing in mid-2017, little about the new administration seems clear enough to project the likely future. History has shown that the homeland security responsibility is defined largely by events outside the control of any administration: terrorist attacks, pandemics, hurricanes, earthquakes, and all range of man-made and natural threats and catastrophes. Recent events in both the United States and various parts of the world suggest that the threats from terrorism, climate change, and pandemics are growing and not receding. The best approach to deal with an uncertain and threatening future is to create organizations and networks that are agile, adaptive, and inclusive. The mission given to DHS and the overall homeland security enterprise remains a daunting challenge to find the best approach to organizing and managing what remains perhaps the most complicated and high-risk area of public management.

# Managing Pay in the Public Services

Stephen J. Perkins
Global Policy Institute, London Metropolitan University, London, UK

## Synonyms

Compensation; Pay remuneration; Reward

## Definition

Located in its socioeconomic context, pay may be defined as something for something, reward for time, physical energy, know-how, and status. Definitions of other terms follow embedded in the text.

## Introduction

Public sector pay is a significant feature in government expenditures. For example, in the UK, according to the Office for National Statistics, in 2009 the public sector pay bill amounted to some 30% of overall government expenditure. In an era of "austerity management," that fact has attracted even more attention to questions around managing pay in the public services around the world.

The object of this entry is briefly to address three aspects of the debate:

- What is the object of managing pay in the public services?

- What ideas drive the choice of approach to managing pay?
- What consequences have been observed in recent years?

Each of these is addressed in turn in what follows.

## Object(s)

The first question must respond to the challenge of whether or not the object of managing pay in the public services is singular – or if multiple objectives may be identified. To address that without going into a lengthy discourse, it is helpful to refer to Lupton and Gowler's classic (1969) text "Selecting A Wage Payment System." These authors refer to debates reaching back well before the publication of their short volume that identify the existence of what has been referred to as a bargain-around-employee effort (an "effort-reward exchange"), one that bridges the indeterminate nature of the employment relationship. In other words, in work situations it is never possible precisely to specify what activities are to be undertaken by an individual employee, depending on how the parties interpret the nature of the relationship. Unlike programmable machines human workers apply their subjective understanding of their role description, leaving open the possibility that the effort applied will vary depending on that understanding, with implications for work outcomes. To help close the potential gap, using employee pay as an explicit reward for compliance with the employer's desire for effort, Lupton and Gowler suggest categorizing effort across four intersecting dimensions: time-effort, energy-effort, competence-effort, and status-effort.

Taking each in turn, (1) paying for time-effort compensates employees for the time devoted to their work (classical economics theory focuses on this aspect: incentivizing the individual to forego nominal leisure time for time in the workplace). (2) Energy-effort, in particular, focusing on manual work situations, concerns the physical effort an individual might devote resulting in measurable outputs in, say, a manufacturing process, for example, rewarded on the basis of what has been termed "measured day work" or "payment by the results." (3) More relevant in situations applicable to a number of public services employees such as healthcare workers, local and national government officials, teachers, and so on, competence-effort involves applying specialist know-how to deliver services. And (4) status-effort concerns the application of high-level expertise and decision-making accountability, applicable to those supervising and managing the work of others, particularly in professional organizational settings such as those found in the public services – e.g., education, healthcare, urban planning.

In the case of each of Lupton and Gowler's effort-bargaining categories, the issue for the employer is one of managing the process. For example, there is the risk of a gap between the availability of an employee's time and how the individual uses it for the employer. There is also the issue of scope to replace physical effort with capital investment to automate manufacturing processes, shifting the focus away from managing revenue (pay) costs. And in the case of specialist and high-level accountability-based work, the issue arises as to whether what has traditionally been understood as "professional" work may be subjected to detailed managerial oversight. In its contemporary application, academic commentary suggests a reconfiguration of professional work and thus expectations of – and explicit recognition for the effort applied by – those employed to undertake it.

## Ideas

Those reflections lead into the second question, which can be situated in the context of debates about notions of "modernization" in public policy settings. Organisation for Economic Co-operation and Development (OECD) commentary published in 2012 refers to the ways in which the approach labeled "new public management" (NPM) has influenced attempts to control pay for public service workers for at least two decades. The same report adds that the changes have been given urgency due to the austerity agenda pursued

by many governments across OECD countries in recent years, with consequences for managing the pay of those individuals and groups employed in government jobs – at national, regional, and local levels within the various jurisdictions.

Margetts (2012) is among those scholars for whom definition of "modernity" and "modernization" needs to be properly specified. She uses a trinity of processes to describe public policy modernization, processes which align with NPM-style oversight of the public services employee-employer effort-reward exchange: (1) efficiency and "incentivization" at the level of the individual actor; (2) integration, interconnectedness, standardization, and formalization; and (3) specialization, expertise, scientific advancement, and technological innovation.

Following the logic of NPM, modernizing pay for public services employees involves managerial interventions intended to shift the emphasis from time- and energy-effort toward competence- and status-effort. Or rather performance outcomes from applying these latter two, re-specifying the basis of professional work bringing traditionally autonomous experts under the control of a more standardized bureaucratic framework of continuous managerial appraisal. Such practices contrasting with work organization and assessment of outcomes being determined by professionals themselves (Noordegraaf 2013).

State employment agencies have been recorded, in accordance with this rationale, attempting to move away from universal norms for pay determination, where the effort-reward exchange is specified under collective bargaining processes, in favor of pay administration at a more devolved level. With individual managers expected to evaluate employee "contribution" levels influencing individual pay awards. The related assumption is that localized market rates attaching to supply of and demand for types of expertise in a so-called knowledge economy, coupled with individual performance as judged managerially, should set individual pay levels, not nationally bargained norms and "seniority" (periods of tenure in post). Furthermore, under public services austerity cost control principles greater attention is placed on reward from all sources – "total rewards management," in the jargon.

In some cases NPM coupled with an emphasis on cutting costs under austerity regimes has taken a step further with outsourcing of public service work a preferred option, that is, removing whole categories of "noncore" employees (e.g., non-clinical employees in healthcare organizations) to expose their pay to localized private sector market norms.

## Consequences

Turning to the third question above, recent OECD commentary argues that coupling NPM with the austerity agenda has meant that changes have been managerially complex and, for employees, anxiety-inducing leading to the risk of resistance, given limited time for managements to prepare to implement what may be viewed as a fundamental rewriting of the implicit or "psychological" contract against which pay in the public services is determined. Moreover, managerial preparedness to accept the changed accountability for devolved and individualized effort-reward determination has been found wanting, with the outcome that NPM aspirations may have been compromised at least to some extent where the intention was to make public services more accountable to "clients" for high-performance organizational outcomes.

Perkins and White (2010: 254) note "undoubted change" but also "significant areas where progress has been less than envisaged." And, for example, in the UK very recently resistance among professional "knowledge workers," exemplified by junior doctors engaged in a high-profile dispute with national government employers around pay levels associated with meeting the needs of a service involving regular "unsocial hours" working, has at least called for reflection on the scope with which public service managers can codify how professional work and compensation for it is to be controlled in accordance with NPM norms.

One explanation may be found in "path-dependency" theorizing. Sahakiants et al. (2015) refer to argument in the academic literature foregrounding historical events and institutional self-reinforcing mechanisms derived from potentially inefficient patterns of action built up over

time by the possibly unintended consequences of earlier decisions and positive feedback processes. These phenomena may "lock-in" practices such as pay determination or encourage resistance to changes to the status quo. More practically, as Perkins and White (2010) conclude, a lack of serious investment to facilitate public services transformation in how pay and other service conditions are determined may have forestalled re-specification of the effort-reward exchange in any fundamental way, where the financing of incentives to cooperate is needed to be found through efficiency savings across the particular service or significant parts of it. Amplified by the exigencies of austerity politics, which risk undermining long-term efficiencies in public services provision if pay levels are permanently reduced through "skills leakage" out of the sector.

None of these arguments are intended however to adopt a dogmatically negative view of the consequences in every instance of changing the basis on which public services pay may be managed. Focusing on the specific notion of pay for performance, some analysts have argued consistently against attempts to incentivize people through extrinsic rewards (like "bonus" pay). In theoretical terms, such interventions risk crowding out the intrinsic motivation individual employees have to do a good job. However, informed by a study focused on developing economies, Jeff Friedman (reported speaking to a research paper he had had published in 2011 at a Centre for Market and Public Organisation conference) criticized these conclusions. Friedman's point is that a majority of studies used to inform the "crowding-out effect" concerns have been based on laboratory experiments using "rich students from western countries" and that the conditions fail to replicate those in the real world.

Friedman contends that employees are already incentivized for working – through being paid wages. As these may be assumed to have the effect of motivating individuals to turn up for work, then the offer of additional (bonus) pay reflecting performance contributions might be assumed to have the potential to enhance motivation. Potentially *crowding in* the motivational effects, say, of a public service worker motivated to serve the public good. For example, Friedman cites the case of a Zambian healthcare worker speaking positively about the benefits of the introduction of bonus supplements beyond employees' salaries. The individual was recorded as working in a geographically remote facility that rarely has supervisory visits from senior managers. The respondent's view was that the additional pay, contingent on performance outcomes achieved, served to demonstrate that "somebody cares" about us. The suggestion is that some NPM ideas applied to managing employee pay may not be inappropriate in principle.

As Perkins and White (2010) observe, however, problems arise when policy makers fail to ensure that those to whom they devolve managerial accountability to enact policy are not equipped and supported to discharge their duties as intended. Informed by Australian data gathered in a large public research organization, Brown (2001) cautions employers making choices between alternative pay adjustment systems to avoid approaches that may be incompatible with employee preferences when accounting for situational factors. Brown's study found that higher levels of perceived job security were associated with support for pay adjustment based on individual merit, while good promotional opportunities following performance appraisal were associated with lower levels of support.

Finally there is the "fairness" debate that continues throughout many business systems when considering the remuneration gains made by senior corporate executives which, although with sums well below those seen in liberal market economies such as the USA, have percolated into public services pay outcomes. With the result that, to counter public outrage, investigations have been ordered by government employers, such as the one encapsulated in a 2011 report by economist Will Hutton into "Fair Pay in Public Sector," initially at least giving rise to suggestions that pay dispersion between those at the top of organizations and those at lower levels ought to be regulated against transparent norms setting a maximum on the gap deemed acceptable. Propositions reinforced by increasingly prevalent expectations that equal pay for equal value should apply at peer level when comparing rewards mindful of demographic factors across a heterogeneous public services workforce.

As an adjunct of fairness considerations, there is long-standing interest in explaining the persistence of corruption among public servants, especially in less-developed nations, where low civil service pay levels have been theorized as an important contributing factor. Gong and Wu (2012) draw attention to the assumption that, when salaries are low but service expectations remain high, government officials may demand more compensation from informal or even illegal channels than what is officially sanctioned. These authors apply Chinese case study evidence to caution against uncritical acceptance of such thinking – the relationship between high pay and low corruption in public services should not be regarded as simply linear.

## Conclusion

Given its significance, governments worldwide have made increasingly determined interventions actively to manage the pay of people employed in public services roles. We have considered three issues. First, the intended role of interventions by managers around pay in the public services, concluding that it has been to shift the balance on to employees themselves to assure performance contingent pay outcomes. Second, the ideology informing approaches to public services pay management, finding that notions of NPM have been embraced to modernize and so regulate public employees' pay in the way described in answer to the first point. The idea drives choice of approach and intended outcome. Third, consequences of directional convergence on contingent pay regimes under NPM thinking – some of which may be viewed as unintentional and not necessarily desirable. Here, deeply embedded institutional structures demand our attention influencing the likely complete attainment – or not – of NPM goals in pay determination. However, as discussed above, while some academic commentary criticizes the more express-intended linkage between pay and performance, there is evidence for a "Hawthorne effect": like the celebrated classic study, those on the receiving end of active managerial interventions may in some cases at least regard the "interest" taken in them warmly so that positive outcomes managerially are at least a possibility.

# Managing Police Organizations

Sean McCandless[1] and G. Michael Vogler[2]
[1]University of Illinois-Springfield, Springfield, IL, USA
[2]Denver Police Department, Denver, CO, USA

## Synonyms

Management, Police

## Definitions

Managing police organizations is the process by which police managers optimize the delivery of

efficient, effective, economical, and equitable services through taking into account multiple dimensions, including environments, human relations, community dynamics, and organizational performance.

## Introduction

Police departments are no exceptions to the need for public organizations to have good management. These dimensions are discussed in terms of the major factors constituting the management of public organizations (see Rainey 2009).

## Environments

Police departments reside in multiple environments. Police managers, regardless of level, must know of and be responsive to these environments.

First, police managers operate within multiple legal environments. Constitutional law, especially rulings by courts, is at the highest level. Police managers must ensure proper training in constitutional law. Especially important considerations are the provisions of the Fourth Amendment, such as searches and seizures, probable cause, and outgrowths of the Fourth Amendment related to reasonable suspicion. Officers must also understand principles of the Fifth Amendment, such as to due process and Miranda rights. Further, managers must cultivate practices that enshrine protections of the 14th Amendment's due process clauses and equal protection clauses. Many of these protections are doubly listed and expanded upon in state constitutions, thus mandating police managers be aware of constitutional law at multiple levels. This requires an evolving understanding of how court rulings – such as that in *Florida v. Jardines* (2013), which provided limits to how police use drug sniffing dogs to obtain warrants – mandate changes in practice. At the state and local levels, managers should be aware of changing definitions of illegality. One such example is Colorado, which recently legalized private marijuana consumption, which provided changes to policing requirements.

Second, political and economic environments affect what police agencies do. Elected leaders, especially at the state and local levels, affect policing priorities. Police managers must be advocates for their departments with these leaders, who ultimately approve police budgets. Managers must be aware of what political leaders are likely to fund and support, be responsive to their concerns, and stand accountable for departmental actions, especially to mayors and city councils.

Third, police managers must be aware of historical and community environments. While all communities have overlaps in terms of prevalent crimes, each community presents unique policing challenges. For instance, a community that has an issue with heroin trafficking will require different policing strategies and tactics than one that does not have these issues. Police managers need to modify practices accordingly. Further, each community has multiple community groups with different expectations and desires. Police managers must be aware of these different expectations and seek to balance them fairly. This requires being aware of stakeholders and who have historically been excluded from conversations, which ideally promotes the greatest possible community buy-in to departmental activities.

## Goals, Values, Culture, and People

Police serve multiple social functions – enforcing laws, providing law and order, and being responsive to the community. Departmental, officer, and community values should be aligned. If they are different, police managers will be unable to effectively complete departmental missions. Achieving balance could be problematic. For instance, a department may be adept at keeping its operations close to what a community expects, but officers within departments may feel that certain policies and goals produce inefficiencies and lower the effectiveness of law enforcement. Frequently, when police officers discuss issues with the community, officers are primed to discuss issues such as drugs, auto theft, gang activity, and similar crimes. Police employ statistics and have accompanying strategies to address these problems, but when officers and communities exchange ideas,

officers may be shocked to find communities may not share similar concerns regarding the crimes police find most important. Community expectations frequently are not about criminal activity but quality of life issues (e.g., speeding, homeless presence in parks). This is one of inherent problems with Data Driven Policing programs such as COMPSTAT – police solely set the issues to be addressed and the benchmarks for success. Thus, when police see themselves as successful achieving their statistical objectives, the community may be left with a sense of alienation.

Police managers need to cultivate multiple values – professionalism, upholding constitutional values, being fair, and responding to community expectations. Many values are evident in the Code of Ethics of the International Association of Chiefs of Police, which notes that an offer's "fundamental duty is to serve the community; to safeguard lives and property; to protect the innocent against deception, the weak against oppression or intimidation and the peaceful against violence or disorder; and to respect the constitutional rights of all to liberty, equality and justice." Other elements include enforcing the law "courteously and appropriately" and accepting the badge of office "as a public trust to be held so long as [the officer is] true to the ethics of police service." (International Association of Chiefs of Police, 2017)

Police culture has experienced changes in the roles officers are expected to perform. Officers are being seen less in terms of the traditional model of warriors but as guardians. Members of the President's Task Force on 21st Century Policing noted that police officers and soldiers, while bearing similarities, have different missions and rules of engagement, with a soldier's mission being to conquer whereas a police officer's mission is to be a guardian and to protect (the latter of which especially emphasizing the importance of making independent decisions) (President's Task Force on 21st Century Policing 2015) (Police Executive Research Forum, 2016). Line officers can see this shift as embodying conflicting messaging from the public, elected officials, and senior command (Stoughton 2015). These officers have increasingly complained that this model switch represents a threat to their safety (see Davis 2015) and that contradictory roles expected by different groups contributes to occupational stress (Adbollahi 2002). Police managers need to demonstrate to officers how this conception of role shift meets community expectations but also to emphasize that the guardian role is increasingly what communities expect even in critical and traumatic incidents.

Other dimensions of culture and people affect police management. One is that departments may have different groups and factions within them. Conflict within departments can come from these factions. Similar to the general public, officers may associate with fellow officers who share demographic characteristics, especially based upon race, gender, sexual orientation, generation, seniority, and education. Intraorganizational tensions can mirror societal conflicts (e.g., LGBTQ rights movement and Black Lives Matter). While education in itself typically does not cause conflict, advanced education can prepare officers for promotion. Those with greater education will often be promoted ahead of those who might be objectively superior officers but who cannot effectively compete on promotional exams. Officers' demographic characteristics and the demographic make-up of a department affect management. Police generation is also a source of factions. The first years of officers' career define how they see the art and craft of policing. Thus, officers on various sides of societal policing benchmarks are likely to see policing differently, and such benchmarks include pre/post Miranda rights, pre/post Rodney King riots, pre/-post 9/11, pre/post Black Lives Matter movement, and pre/post mass implementation of body cameras.

## Incentives

Departments require both extrinsic and intrinsic incentives. Pay is an extrinsic incentive, which can vary widely between departments, even within the same general area. The financial condition of a city/county is the primary factor influencing pay differences. Community expectations of police factor into pay and benefits. An agency requiring a bachelor's degree for entry-level officers will typically pay higher than one

requiring a high school diploma. Benefits can vary and are frequently the same package offered to all governmental employees. Pay and benefits are linked to initial recruitment and retention. Officers hired by an agency with low pay and benefits will, once they have experience, frequently transfer to larger departments with better compensation packages. Pension plans and retirement options are also important. Due to the stressful nature of policing, the retirement age is considerably lower (55) than the private sector (63). Opportunities for advancement are also incentives. In larger departments, such opportunities come in waves, and smaller departments might have fewer opportunities. Many departments have strict seniority systems to determine pay, shifts, vacations, and days off. This system often determines when officers receive advanced training or promotions. Some argue this eliminates issues of favoritism and nepotism, yet these models may fail to sufficiently incentivize and motivate officers. Intrinsic motivations include officers being motivated by a sense of serving the community, exercising discretion, and policy-making.

## Structures, Tasks, Technologies, and Processes

Police departments have multiple structures, tasks, technologies, and processes. First, departments are quasi-military structures with multiple tasks. Much of this can be conceived of in terms of span of control, namely, how many subordinates one person can supervise. Generally, this is considered 4-7 depending on the characteristic of the tasks the subordinate is performing. It is generally considered that less supervision is necessary when tasks are more routine and when fewer options are available for an officer to choose from. Conversely, when available discretion is more variable, more supervision is required. In policing, situations can unfold rapidly, and there often is no way to micro-manage the entire length of the chain of command. In a midsized or larger department of 100 officers or more, the span of control necessitates that a chief supervises a handful of deputy chiefs, who then supervise senior command staff such as lower level chiefs/commanders/captains. Senior command officers oversee junior command officers (lieutenants), who supervise line supervisors such as sergeants corporals, who provide supervision to line officers and detectives. Communication and direction go through the chain to try to ensure messages and expectations are met. Given the rapidly changing nature of policing, it is not practical for chief executives to make every decision and give each new direction. By allowing the chain of command to know the objectives and rules of engagement, these decisions and direction can be given by those closes to the action with the most knowledge in the shortest time frame.

Second, departments have multiple tasks, such as patrol, investigations, and more. Patrol is the heart of policing. The primary task is responding to calls for service. These are calls of criminal issues, civil disputes, and other emergencies. It is typical that people will call the police for problems they cannot handle on their own or for which they do not know the appropriate resource. Patrol also initiates street level self-initiated activity such as traffic stops. This is where most complaints are generated as well as where highly controversial incidents such as the deaths of Michael Brown and Eric Garner occur. Police managers need to set appropriate guidelines for such stops, such as ensuring that officers are aware of not only constitutional requirements for such stops but also that any force used is proportional, especially deadly force, which should only be used as a last resort.

Investigations might be conceived of as where patrol leaves off. Patrol determines that a crime likely occurred and conducts the initial investigation. The case is then passed to the detectives for follow-up and coordination with the prosecutor's office. There are units that engage in self-initiated work, such as vice/narcotics and intelligence. Other tasks include inventory, technology management, finance, grants, human resource management, and training.

Third, technologies in police departments have undergone significant changes in recent decades. Technologies available to departments vary by department (which is also a function of budgeting and need), such as the weapons available (both

firearms and beyond), cameras (both in cars and on the body, but not all departments have either or both), computers and IT (especially databases and tracking software), and cutting-edge technology (such as drones and thermal imaging).

Relatedly, police managers must be aware of legal issues of technology, especially related to the fourth Amendment and emerging technology. Recent discussions of police technologies have concerned privacy and militarization. Debate of the use of body cameras is growing with broader implementation, and there are continuing debates about when the cameras should be activated and de-activated, such as when should a video be released to the public, the role of defense attorneys, and the processing of freedom of information requests. Body cameras raise multiple issues regarding privacy, especially.

Police managers must also make decisions on how to budget departments, especially regarding how to allocate funds for equipment, training, officer recruitment and retention, and community outreach. A critical element of this is recruiting a talented and diverse force. Many police departments have had issues with sufficient staffing, thus experiencing personnel shortfalls. It has also been historically difficult to promote racial and gender parity within departments, and some agencies have begun targeting recruiting to make the ranks more reflective of the populations.

## Leadership and Strategy

While many may associate leadership and strategy to those at the top of a public organization, there are not confined to particular levels. All levels exhibit elements of leadership.

For those at the strategic apex, especially chiefs, leadership and strategy consist of balancing numerous dimensions. These include being aware of community expectations, especially at times when community expectations might conflict. A police manager must be an arbiter between multiple community expectations to attempt to ensure that all populations receive high quality law enforcement.

Further, chiefs must be aware of officers' expectations. When controversial issues arise, the police leader is frequently put in a difficult position. The leader has a responsibility to the community to be forthright, transparent, and responsive. Simultaneously, officers have an expectation that leaders will support them and give them the benefit of the doubt until there is evidence of wrongdoing. In these cases, it is difficult to satisfy the expectation of both the officers and community.

It is also critical to acknowledge that leadership exists at the street level as well. In any service call, an officer must enforce the laws, protect the public and ensure safety, be an adjudicator, make decisions about right and wrong, and take appropriate action (Vinzant and Crothers 1994).

Relatedly, police managers must address stress. One of the leading contributors to police stress is from the organization itself. Some of this is logistical and part of the realities of policing, such as shift work, on-call, and unpredictable days off. However, much police stress is rooted in organizational leadership cultures, and issues concern perceptions that discipline as well as performance evaluations are unfair and unjustified, due process is lacking, and that there are few opportunities to achieve higher ranks (Adbollahi 2002).

Police managers must also understand and nurture officers' mental health. The warrior mentality does not lend itself to emotional resiliency. The guardians protect themselves in the same light as they protect those they serve. In this process, leadership addressed the stigma and taboos surrounding of mental health. "This is not about touchy-feely conversations; it's about supporting officers' mental health in the same way as you would their physical health and creating an agency culture that keeps officers resilient, adaptable, and fit for duty" (Usher et al. 2016, p. 17). Departments are increasingly being called upon to formalize mental health initiatives for officers.

## Organizational Performance

Police departments are also expected to perform in multiple ways, which can be conceived of in terms of the four pillars of public administration – efficiency, effectiveness, economy, and social equity. Police agencies have historically focused on efficiency – answering the greatest feasible

number of service calls in as little amount of time as possible (i.e., to use resources well). Effectiveness is a core goal of law enforcement, namely, the degree to which police are successful in their mission. Economy is also critical in that police agencies are expected to provide services at the lowest possible cost. Finally, fostering social equity is increasingly important. While most measures of police performance focus on efficiency, police agencies are increasingly being held responsible for fairness, especially toward historically marginalized groups. One side effect of having multiple types of performance, especially ones historically dominated by efficiency, is that police agencies experience difficulties in balancing these areas. In order to achieve one or two, the others may experience issues, especially concerning making sure that social equity is well represented (Charbonneau and Riccucci 2008).

## Conclusion

Managing police organizations can be broadly conceived of in similar terms as managing public agencies writ large. However, as demonstrated above, management requires numerous dimensions to be taken into account. Given the nature of policing, particularly its dangers and multiple, often competing expectations of performance, police managers should be aware of and take into consideration the most efficient, effective, economical, and equitable balance between multiple dimensions.

# Managing Telework in the American Bureaucracy

Dimple Sunayna Johnson[1], Aaron D. Johnson[2] and Kristen Crossney[1]
[1]West Chester University of Pennsylvania, West Chester, PA, USA
[2]Montgomery College, Germantown, MD, USA

## Synonyms

Managerial styles; Remote work; Supervisor; Telecommuting; Telework

## Definition

Managing telework in the bureaucracy refers to agencies and managers encouraging and promoting telework in the American federal government.

## Introduction

The 2009–2010 snowstorm in the Washington DC Metro area crippled the nation's capital and shut

M

down the government for days, costing the federal government an insurmountable amount per day. Subsequently, the 2010 Telecommute Enhancement Act formalized telework in the American federal government, supporting remote work and providing a means for employees to continue working during emergencies (Caillier 2015). The Telework Enhancement Act brought with the government into the twenty-first century, promoting telework within the public sector and its associated agencies. However, over a decade later, many agencies have been slow to adopt to telework, while other agencies have been retracting the policy by restricting and even eliminating the benefit (Wagner 2018).

In 2017 only 21% of the 43% eligible federal employees in the United States partook in some form of telecommute work (Office of Personnel Management [OPM] 2018). While telecommuting eligibility remains steady, the participation has declined (OPM 2018). This decline may be attributed to a lack of confidence supervisors have in telework, and the lack of trust managers have in remote employees (Wagner 2018). Thus, while eligibility and worker interest are relevant factors in telecommuting, supervisor discretion becomes the key deciding factor in telework adoption.

The American federal government annually reports on the status of telecommuting, documenting the number of federal employees who are teleworkers, how often workers telecommute, and the associated outcomes. However, the evaluation of the frequency of telework opportunities from the perspectives of leadership and management continues to be overlooked. Agency managers are ultimately responsible for endorsing their employees to telework. This essay addresses how the potential telework opportunities of federal employees may be impacted by the perceptions they have of their supervisor's managerial type. The goal is to provide agencies and managers with the necessary information to create awareness around the impact the supervisor's perceived managerial types have on the employee's telecommuting frequency.

## Telecommuting Background

The term *telecommuting* was coined by Dr. Jack Nilles, an American agency manager, who initiated a telework project in 1973 to combat the issue of increased commuters and rising oil prices (Allen et al. 2015). Twenty years later, many large companies in the United States were practicing in remote work to comply with the 1990 Clean Air Act (Allen et al. 2015). This was followed by the 2010 Telecommute Enhancement Act (Act) that formalized telecommuting in the federal government. The Act defines telework as a superior/subordinate agreement that allows an employee to conduct their work responsibilities from a remote worksite. Telecommuting, also known as telework and remote work (Mokhtarian 1991), will be used interchangeably through this essay. Telework will be conceptualized as a "remote work type [that] would be considered telecommuting if it involved remote management and reduced commute travel" (Mokhtarian 1991, p. 5).

Telework can vary in frequency, i.e., the number of times an employee telecommutes in a workweek, ranging from situational/routine or part-time/full-time (Caillier 2015; Mokhtarian 1991; OPM 2018). Whereby "routine telework occurs as part of a previously approved, ongoing, and regular schedule. Situational telework is approved on a case-by-case basis, where the hours worked were not part of a previously approved, ongoing, and regular telework schedule" (OPM 2018, p. 10). Additionally, telecommuting has generally been characterized as working from home. However, employer satellite offices that are closer to an employee's home and are equipped much like the main office can also be considered a form of remote worksite (Caillier 2015).

The OPM (2018) issued a report on the *Status of Telework in the Federal Government*, documenting that from the American federal employees that telecommuted in 2017, 83% experienced improved morale; 77% experienced reduced stress; 68% experienced improved health; and 72% experienced improved performance (OPM 2018). These metrics support research findings which indicate that employees experience reduced stress and higher productivity as a result of spending less time commuting (Goodrich 1990). The government agencies have also benefited from remote work through increased

worker productivity, reduced overhead operations costs, and an appealing retention and recruitment benefit (Goodrich 1990). Additional benefits to telework include helping to alleviate heavy traffic on congested roadways, reducing air pollutants by having fewer cars on the roads, and enhancing the community's economic development through increasing the potential number of parents in the workforce by providing alternative work opportunities from the home (Goodrich 1990).

Some studies reveal that the benefits of remote work vary based on the frequency of telecommuting (Caillier 2015; Golden 2006). Caillier (2015) states that frequent teleworkers have a higher level of public service motivation than those that did not telework as frequently; the exact frequency (i.e., 1 day vs. 2–3 days vs. 4–5 days) was shown to have a direct impact on motivation, attitude, job satisfaction, and productivity. Studies also show that "the degree of teleworking was found to be positively related to organizational commitment and negatively related to turnover intentions, such that a higher degree of teleworking was associated with more commitment to the organization and weakened turnover intentions" (Golden 2006, p. 183).

Despite these benefits, reports indicate that telework participation among American federal employees has been stagnant and almost at a slow decline since 2016 (OPM 2018). Telework in federal government was intended to provide employees with a better quality of life and provide employers with the ability to "continue business as usual" during emergencies, when travel to the main office is prohibited (Caillier 2015). However, federal managers continue to disregard the use of remote work (Day and Burbach 2011). OPM has created avenues to provide managers with the necessary training and resources to promote and advocate for remote work; however, the percentage of routine subordinates participating in telework is still restricted by managerial inflexibility (OPM 2018).

## Telecommuting and Managerial Types

Leaders are the frontline to successful telework adoption, and it is important that they actively and positively use their influence to embrace remote work policies as part of an employee's work style (Goodrich 1990). However, supervisors, especially those that are new to remote management, may lack the necessary confidence, causing the management to micromanage the teleworker's tasks instead of managing the outcomes (Day and Burbach 2011; Goodrich 1990). Furthermore, managers may contribute to the employee's feelings of isolation by inadvertently neglecting to include remote workers (Day and Burbach 2011). Leaders of teleworkers need to assume more responsibility when managing remote workers and need to lead by example, keeping lines of communication open and taking on "a collaborative management approach in which teleworkers are empowered to manage their own activities" (Day and Burbach 2011, p. 12). Management's role in successfully implementing telework is important from the perspective of frequency in remote work participation. An employee's telecommute frequency in turn impacts the ability to assess various goals; "for example, situational telework facilitates continuity of operations planning, while frequent routine telework may facilitate real estate reduction goals" (OPM 2018, p. 10). While telework frequency affects the organization, the frequency of telework opportunities can be influenced by an employee's perceptions regarding how legitimate or realistic such opportunities might be facilitated. The leadership styles employed by supervisors on the frontline can play an influential role in breeding various perceptions about remote work opportunities.

Blake and Mouton's (1964) two-dimensional managerial grid provides leaders with a framework to understand the gaps in their supervision. The grid provides a means to (1) predict the impact the managerial behavior has on peers and subordinates; (2) achieve individual and organizational development changes; and (3) determine organizational culture and the associated barriers (Blake and Mouton 1964). The grid rates managers on their concern for people and their concern for production and has been universally used across the government to identify different ways of supervision (Blake and Mouton 1964). The five key managerial types include *team management*, the optimal

managerial type that organizes people and production into a unified system; *middle-of-the-road* management, a negotiator who attempts to compromise some of the concerns with both the people led and production to be undertaken; *task management*, a manager who focuses on production and considers people as resources to achieve goals; *country-club management*, one who focuses on creating a comfortable environment for the people; and *impoverished management*, one who expends minimum effort with people and production (Blake and Mouton 1964). The managerial grid has been used to work on core management issues such as supervision, planning, execution, follow-up, conflict, commitment, and management development (Blake and Mouton 1964).

## Telecommuting Sector Comparison

While the American government has the OPM agency tasked to promote and advocate for remote work, resources have largely focused on performance, policies, and procedures. There has been little to no awareness about the impact managerial types have on successful telework adoption. This is an important consideration because, ultimately, individual agencies and subsequently the managers within those agencies are responsible for successfully implementing and supporting their employees in pursuing telework (Goodrich 1990).

Are there potential relationships between telework and a supervisor's perceived managerial type based upon working in the government or in other nongovernment organizations? Whether one is working for an impoverished manager, a team manager, or any of the other three managerial types, there may be an equal opportunity for telework. Additionally, an employee working for the government has no greater opportunity to telecommute than an employee working at any other type of organization. One might remain unconvinced that how a supervisor prioritizes task and relational issues has no effect on telework decisions. However, the perception of a realistic telework opportunity might not be held equally when working for supervisors with various managerial types. Employees who perceive themselves working for country-club managers may believe they have slightly more opportunities to telework than employees who perceive themselves working for middle-of-the-road and task managers. The difference from one end of the spectrum to the other regarding perceived managerial type might be connected to the perceived opportunity to potentially telework one more day out of the week.

While employees with managers that adopt the country-club managerial style may be more prone to have the highest frequency of telework, extensive research is needed to make a conclusive claim. Sampling the government employee population is a hard endeavor; this is probably why some of the most prolific scholars in the field opt to use secondary data as a means of exploring such variables. Federal employees can display concern and trepidation about the anonymity participating in such inquiries, likely fearful of potential retaliation from agency management as may be seen by agency's slow telework adoption rates and the impact management have on an agency employee's decision to telecommute (OPM 2018; Paez and Scott 2007).

## Conclusion

Since telecommuting is usually at the manager's discretion, adoption rates are impacted by the manager's decision and approach toward remote work, in turn impacting an employee's decision on whether or not to telework (OPM 2018; Paez and Scott 2007). Agency leaders in the American federal government need to be cognizant that their actions result in their employees' reactions. As a result, it is imperative to understand the impact a leader's managerial type has on an employee's telecommuting frequency.

Frontline supervisors and managers are the key to successful telework implementation (Goodrich 1990; OPM 2018). Blake and Mouton's (1964) managerial grid is an important consideration when assessing teleworker turnover rates, especially if work-life balance is compromised and public employee telework participation continues to experience a slow adoption rate. Additionally, perceptions of a frontline supervisor's managerial style can also impact an employee's desire to

telework. Given the transactional nature of the supervisor-subordinate relationship, employee's perceptions of their frontline supervisors likely play a role in the employee's interest and decision to pursue telework.

The reality is that leaders need to be aware of the impact that their managerial types have on an employee's telework frequency, and the American government can benefit from understanding the implications to telecommuting per the managerial types. Leadership's demeanors impact an employee's telework frequency and more importantly, their confidence in responding to such studies without retaliation. Telework is here to stay (Caillier 2015; OPM 2018). To successfully pave the path for the betterment for implementation and adoption, public employees in the United States need to be assured that their telework participation and contribution to such academic research is void of any concerns of retaliation.

## Synonyms

Consumer good health; Consumer wellbeing

## Definitions

**Consumer Welfare** is the individual benefits resulting from the consumption of services and goods.

## Introduction

Agriculture plays a prominent role in the economy of most countries in sub-Saharan Africa (SSA),

with a great potential to drive economic growth and reduce poverty and hunger. But, due to subsistence agricultural practices, high postharvest losses, fragmented markets, or recurrent climate shocks, food security is a big challenge in those countries. Besides, a great percentage of the population depending on agriculture for their living are poor. As a consequence of increasing pressure on food supply, the world food market experienced a dramatic surge in the price of many staple commodities between 2006 and mid-2008, with for instance, a growth rate of 47% for rice, 44% for maize, and 43% for wheat (De Janvry and Sadoulet 2010).

This raises concern about the impact of food price hikes on the welfare of poor people, since they already spend a large share of their income on food. High food prices have had serious impacts on poor populations, dramatically reducing their already low purchasing power and leading to an increase in hunger worldwide. Following food prices surge, the number of undernourished has increased, especially in Asia-Pacific and SSA by 41 million and 38 million, respectively, according to the Food and Agriculture Organization. In terms of consumer welfare, it has been shown that food price increase reduces consumer welfare in general but depending on the context. Empirical evidence highlights that rural poor are worse off (Leyaro et al. 2010), notably very poor rural households with limited farm and nonfarm incomes (Tafere et al. 2010), while other authors point out the adverse effects on urban poor (Ackah and Appleton 2007; Arndt et al. 2016; Rodriguez-Takeuchi and Imai 2013). Besides, it has been also shown, for instance, in Brazil by Ferreira et al. (2013) that it is the middle-income group that suffered more welfare losses due to the 2008 food price rise.

Thus, context-specific studies are needed to investigate the impact of rising food price on consumer welfare, taking into account specific socio-demographic factors and then design appropriate policies. Indeed, the remaining question that has not been totally solved in the literature deals with the type of policies that better targets poor people. Is a policy targeting food products a better option than a policy targeting specific populations to reduce the impact of food price rises on consumer welfare and especially on poor populations located either in urban or rural areas in SSA? This study tries to answer this question by evaluating the impact of price rises on consumer welfare and by differentiating effects by food products, location, and poverty status of consumers using Cameroonian case study. As many others SSA countries, Cameroon experienced a price hike of main stable foods. Between 2005 and 2007, prices increased by 41.5% for cereals, 103% for chicken, 44.5% for beef, and 30% for fish, 72% for a liter of palm oil (Medou 2008).

## Method

In the microeconomic theory, the impact of price changes on consumer welfare is generally analyzed by either the consumer surplus framework or the compensating variation (CV) methodology. However, the use of the consumer surplus as a measure of economic welfare is not subject of consensus in the literature. The analysis of the impact of a change in food prices on household welfare based on the compensating variation framework introduced by Deaton (1989) is most often used. The compensating variation is defined as the amount of money required to compensate a household for a change in prices aiming to restore the pre-change utility level.

One major issue in such an analysis is to estimate price elasticities, for so doing, Quadratic Almost Ideal Demand System (QUAIDS) model by Banks et al. (1997) will be used to analyze demand taking into account the quadratic form of consumer preferences.

Besides we will include socio-demographic effects since they can affect household demand and expenditure allocation. Using Ray (1983) "demographic scaling" method, effects of a change in demographic variables will be modeled in a similar way as effects of a change in prices (Poi 2012; Pollak and Wales 1992).

Data used are from the household consumption survey, conducted in 2007 by the National Institute of Statistics in Cameroon. The survey was nationally representative and includes variables

**Managing the Impact of Food Price Rise in Sub-Saharan Africa, Fig. 1** A three-stage allocation of total consumption. (Source: Adapted from Béké 2013)

on household expenditures, demographics, and economic activities.

Following the composition of most Cameroonian household's food basket, we aggregate food commodities into four groups: cereals, roots and tubers, animal products, and vegetables (Fig. 1).

The two demographic variables introduced into the QUAIDS model are the location of households, namely, urban or rural, and their poverty status.

## Results and Discussion

### Description of Household Food Expenditure Patterns in Cameroon

At the sample level, roots and tubers constitute the largest share of household total food expenditure, followed by animal products and cereals. The food expenditure share for animal products is higher in urban areas and for nonpoor populations, while it is that for cereals that is higher in rural areas and for the poor. This reflects the fact that maize and rice are also staple goods for most poor households. Finally, the expenditure share for vegetables is relatively low whatever the location or the poverty status.

Food expenditure elasticities show that cereals, roots and tubers, and vegetables are normal goods, with elasticities between 0 and 1. On the other hand, animal products, with an expenditure elasticity higher than 1, are luxury goods. Similar results were found by Béké (2013) for the Republic of Côte d'Ivoire. Thus, an increase of 1% in income leads to an increase of 1.19% in demand for animal products, 0.99% for roots and tubers, 0.92% for cereals, and 0.71% for vegetables. While the demand for animal products and vegetables is highly changed after an increase in income, the demand for roots and tubers as well as for cereals appears to be less sensitive to such a change.

Own-price elasticities point out an inelastic demand for all commodity groups; all elasticities are below unity. Except for vegetables and animal products in rural areas, all commodity groups have positive signs for cross-price elasticities, as expected for substitutable products. On the other hand, animal products and vegetables are complementary goods in rural areas; an increase in the consumption of fish and meat also increases the consumption of vegetables. It is also highlights that cereals and roots and tubers are substitute of animal products and vegetables in both rural and urban areas.

### The Impact of Food Price Rises on Consumer Welfare in Cameroon

We simulated a price increase in each commodity group of 10% and 40% both in the short- and long-term. Indeed, an analysis of food price variations in 2008 showed that prices increased within a range of 10% for fruits and vegetables and 40% for cereals, including imported ones such as rice and maize (Medou 2008).

Results show that the impact of an increase in cereal prices of 10% has almost the same effect at

short and long term on the welfare of Cameroonian consumers. The CV is evaluated between 2.6% and 2.7% of their initial food expenditure. On the other hand, an increase of 40% of the price of cereals has a stronger impact on consumer welfare with a CV that is between 10.4% and 12.3% of their initial food expenditure. The impact on the welfare of Cameroonian consumers of an increase in the price of roots and tubers is the highest of the four commodity groups with a range between 3.3% and 3.4% for an increase in prices of 10% and between 13.5% and 15.3% for an increase in prices of 40%, highlighting the importance of this group of commodities in the daily consumption of households in Cameroon. Regarding animal products, the effect is within the same range as that observed for cereals. At the sample level, the amount of money necessary for compensating welfare losses is between 2.8% and 12.8% depending on the intensity of the price rise and the possibility for consumer to adjust or not their consumption basket after the price increase. Otherwise, the effect of an increase in vegetable prices on Cameroonian consumer welfare is the lowest of all groups of commodities with a value of 1.3% for an increase in prices of 10% and a range between 5.2% and 5.8% for an increase in prices of 40%.

Besides, poor households whatever their location are affected by an increase in the price of cereals and roots and tubers. Furthermore, the welfare of rural households whatever their poverty status is highly affected by an increase in the price of roots and tubers. Similar results were found by Ackah and Appleton (2007) and Leyaro et al. (2010). An increase in the price of animal products mostly affects nonpoor households in both urban and rural areas. This is in line with the fact that those households spend more of their total food budget on animal products, the latter being a luxury good.

## Summary of Main Findings and Policy Recommendations

The results showed that the demand for food commodities in Cameroon is price sensitive. A positive relationship between price rises and household welfare losses is also observed. However, the impact depends on the intensity of the price change; the highest the price increase is, the highest the impact also is. Besides, welfare effects in the long-term are greater than in the short-term, but only for high price rises. Moreover, results highlighted different welfare losses depending on the geographical location and poverty status of the household. The highest welfare loss results from an increase in the price of roots and tubers. Poor and nonpoor households irrespective to their location are similarly affected by an increase in the price of roots and tubers. Additionally, the urban and rural non poor are also affected by an increase in the price of animal products, while rural consumers whatever their poverty status as well as the urban poor are the most affected by an increase in the price of cereals. Even though, the impact of an increase in cereal prices has a higher effect on the welfare of poor households, it is the urban poor rather than the rural poor that are the most affected. For animal products, urban nonpoor are more worse off, while an increase in the price of vegetables has the smallest effect on the welfare of consumers whatever their location or their poverty status. Thus, both product-targeting policies especially on roots and tubers and policies aiming to increase poor households' revenues would be of interest to increase food availability and access for poor households.

Regarding recommendations to policy-makers, our results showed that a product- and a population-targeting policies should be developed and implemented in order to manage the impact of food price rises on Cameroonian consumer welfare. In order to fight against poverty and hunger and to prevent the effects of price hikes on in SSA countries as Cameroon, the primary type of support concerns increasing the production of roots and tubers, since it clearly appears as the most important component of the daily consumption of all Cameroonian households. Thus, it is clear that a product-targeting policy is really important to reduce the impact of food price rises on consumer welfare. The second type of results concerns populations the most affected by rises in the price of roots and tubers. There are the poor ones, and especially the rural poor. While those most affected by increases in cereal prices are the

urban poor. Thus, the second food product to target to reach out poor population in Cameroon either in rural or urban areas should be cereals. Facilitating access to these two groups of commodities is really important as poor populations are dependent on their production or imports for their livelihood. Therefore, a population-targeting policy has also to be considered to fight hunger and avoid new food riots.

## Conclusion

To conclude, this study was useful to point out really important elements regarding the design of policies fighting against poverty and hunger in developing countries. Indeed, without a comprehensive understanding of which category of households is affected by changes in food prices and how sensitive they are to such changes, it may be difficult for policy-makers to implement efficient policies. Similar studies for other developing countries are of importance, even though data collection remains a major issue.

# Managing Workforce Diversity Through Human Resource Management

Shah Md Azimul Ehsan
Department of Public Administration, Faculty of Social Sciences, Jagannath University, Dhaka, Bangladesh

## Synonyms

Diversity; Diversity management; Heterogeneity in organizations; Managing diversity

## Definition

**HRM** is concerned with all aspects of how people are employed and managed in organizations (Armstrong 2017).

**Diversity** refers to the state of being different (Mousa 2019). Workforce diversity refers to the differences and the similarities among employees

in terms of race, cultural background, nationality, religion, age, sexual orientation, physical abilities, disabilities, etc. (Saxena 2014).

## Introduction

Workforce diversity acknowledges the fact that people, in reality, differ in various visible and invisible dimensions. Some of the most common types of diversities seen at the workplace are based on gender, ethnicity, age-group, physical attributes, culture, sexual orientation, religion, nationality, language, color, social status, marital status, physical disability, and personality (Kossek et al. 2005; Shen et al. 2009). In recent times, workforce diversity has become a much talked about topic in the human resource management (HRM) domain. This is because its trajectory has been on the rise for the last few decades. In most global corporations, a cross-cultural or multicultural workforce has become a common phenomenon (Joplin and Daus 1997; Shen et al. 2009). According to Shen, D'Netto, and Tang (2010), globalization and enhanced internationalization have been two predominant underlying reasons that have contributed to diversity in the workforce, particularly in the Western economies. On one hand, the duo factors have facilitated the cross-border trade and expansion of businesses; while on the other hand, they have resulted in a high influx of international migration. However, not all cross-border migrations are induced by pull factors. Rather, the growing political tensions across the globe, specifically in the Middle East, have pushed many in search of safer homes. In fact, the last decade has seen a surge in the refugee crisis globally. All these factors have led to a change in the socioeconomic trends and demographics composition of the increasing workforce in both the developed and the transitional economies (Hunt et al. 2015).

Considering the fact that workforce diversity has increased quite dramatically, there is a plethora of literature, for instance, Wilson and Iles (1999), Richard (2000), Bassett-Jones (2005), and Childs (2005) that argues that this diverse workforce can turn out into a blessing and a key to sustained competitive advantage for the organizations. This is because a diverse workforce provides better quality and innovative superior solutions to organizational problems than the homogenous groups; which can ultimately lead to organizational efficiency, effectiveness, and profitability. However, there is another stream of literature (Williams and O'Reilly 1998; Bowers et al. 2000; Webber and Donahue 2001; Van Knippenberg and Schippers 2007; Roberge and Van Dick 2010), which has been skeptical regarding such optimistic claims made in the preceding literature. Their argument stems from the fact that workforce diversity can often be a nightmare for organizations as it decreases group cohesiveness within the organization that gives rise to conflict. Again, it can also lead to counterproductive work behavior like discrimination, derogation, and ostracism. Moreover, these literatures also argue that there is no direct causal relationship between workforce diversity and organizational performance. Therefore, it implies that workforce diversity has both advantages and disadvantages. The ornamental existence of diversity in the organization's workforce will not yield positive results; rather it is something that has to be managed with effectiveness (Agocs and Burr 1996; Liff and Wajcman 1996; Storey 1999; Thomas 1990; Shen et al. 2009). In fact, effective diversity management facilitates in reducing turnover, absenteeism, and attracting the best candidates (Cox and Blake 1991; Richard 2000). A number of studies suggest that in case of managing workforce diversity, HRM can play an instrumental role. This is because HRM can ensure both equality as well as the effective use of diversity (Konrad and Linnehan 1995; Truss et al. 1997; Goodman et al. 2003; Shen et al. 2009; D'Netto et al. 2014).

On this backdrop, the specific objective of this entry is to critically discuss and highlight the role of HRM in managing diversity in the workplace. Having set the context in the introductory part, the next section critically discusses how the idea of managing diversity and equal opportunity differs from one another. The following section sheds light on both the benefits and the limitations of diversity in organizations from a critical lens. The subsequent section puts some critical insights on

how organizations can gain higher returns from workforce diversity using human resource functional areas.

## Equal Opportunity and Diversity Management: Are They Identical?

There are two main approaches to dealing with diversity issues in organizations. One is "equal opportunity" while the other is "diversity management." Managing diversity has its roots in the 1960s civil rights movements in the USA, which were based on liberal political philosophy (Webb 1997). It sparked the demand for an equal employment opportunity. The idea was to end all sorts of discrimination that prevented the entrance of diverse people into the organizations through legal enactments like Equal Employment Opportunity (EEO) and AA (Affirmative Action), which would ultimately lead to the achievement of bias-free-recruitment (Cox and Blake 1991). According to Kandola and Fullerton (1994) and Gordon (1995), equal opportunity starts externally and is primarily driven by the enforcement of legislation that compels organizations to comply with the law in promoting diversity and bringing discrimination to an end. This approach of equal opportunity, which is predominantly based on categorical morality, has become a universal norm. In fact, organizations across the globe, and even constitutions of different countries, have a succinct declaration on EEO and AA.

However, critics of equal opportunity claim that although it might prove to be beneficial in the short run, it will create more problems for the organizations in the long run. Moreover, it has also been criticized for its circumscribed focus, i.e., mere reliance on external legislation in fixing the diversity issues. Besides, Shen et al. (2009), Ng and Wyrick (2011), and Hunt, Layton, and Prince (2015) argue that despite the EEO and AA, integration of women and racial minorities has yet not been successfully done into the workplace. Therefore, it implies that to manage diversity, such an approach is needed, which will be holistic in nature. Diversity management is such a type of panacea that has been termed by Thompson (1997) as an alternative approach to traditional EEO and AA policies and practices. Unlike equal opportunity, diversity management views diverse workforce from a positive perspective (Maxwell et al. 2001). It is guided by the philosophy of consequential morality, i.e., driven by a business case. In other words, diversity management not only recognizes the fact that individuals are different but also values and harnesses that culture of inclusion in organizational practices (Gordon 1995). Because of such an organizational environment, the diverse workforces feel much valued that further enhance their level of satisfaction. This is reflected through their dedicated contribution toward the achievement of organizational goals (Kandola and Fullerton 1994). In terms of scope, Kossek et al. (2005) rightly pointed out that diversity management covers a much broader arena than EEO and AA. Thus, it suffices to say that equal opportunity starting externally through legislation treats only the symptoms of diversity issues. Conversely, diversity management starting internally provides a comprehensive prescription of how to deal with diversity and manage it with sheer effectiveness.

## Benefits and Limitations of Diversity in Organizations

As discussed earlier, diversity in organizations can lead to both positive as well as negative outcomes. From this angle, it can be perceived as a "double-edged sword" (Milliken and Martins 1996). A recent study by McKinsey found that ethnically diverse and gender diverse companies are most likely to outperform their competitors by 35% and 15%, respectively. The study also states that a workforce that is diverse in terms of ethnicity and gender provide organizations more tools for "*problem-solving, broader thinking and better solutions*" (Hunt et al. 2015: 12). These findings align with the more recent "The Great British Diversity Experiment" (Amway 2018), as well as the earlier studies (Wright et al. 1995; Bassett-Jones 2005; Childs 2005; Richard 2000; Wilson and Iles 1999). All these studies argue that when organizations have a diverse workforce, they have

a hub of employees who are not only different, coming from various backgrounds; but also have a distinct way of viewing the problems. As a matter of fact, when these heterogeneous minds thrive to get a solution for organizational problems, their contrastive perspectives facilitate to come up with much creative and innovative solutions than homogenous minds. Consequently, this provides organizations with a sustained competitive advantage and higher returns. Again, when organizations have a multicultural diverse workforce, it helps to improve the corporate image. This further aids in the expansion of the businesses in untapped markets (Kandola 1995).

However, as mentioned earlier, diversity can also lead to several undesirable consequences in the organizations like communication breakdown, low cohesion, employee dissatisfaction due to discrimination, prejudice, and bias, which further result in high turnover (Milliken and Martins 1996; Williams and O'Reilly 1998). This happens mostly when organizations try to deal with diversity only through EEO and AA. An organization might recruit ethnically diverse members for the sake of compliance with the legislative requirements. Nonetheless, if the organization lacks a congenial environment that promotes a culture of inclusion, then they have to face a series of obstacles in case of availing training opportunities, getting a promotion, and fair pay. When they realize that they cannot progress forward because of the "glass ceilings"; they get suffocated with such a tokenistic scheme and prefer to take the exit option. Moreover, authors of social categorization theory (Tajfel 1981) and social identity theory (Turner 1987) argue that diversity often provokes distinction among groups leading to organizational conflict. All these collectively can have a negative implication on the overall organizational performance (Sacco and Schmitt 2003).

## Role of HRM in Managing Diversity

Diversity has indeed got its limitations; nonetheless, it is not something that is beyond manageable. Several studies, for instance, Agocs and Burr (1996), Liff and Wajcman (1996), Storey (1999), and Truss et al. (1997) suggest that most of these diversity-related challenges can be resolved through effective HR diversity management. In fact, Shen et al. (2009) have put forward a comprehensive framework (as shown in Fig. 1) that advocates for managing diversity from three dimensions, viz., strategic, tactical, and operational levels.

Shen et al. (2009) rightly noted that undoubtedly HR diversity management can address diversity issues; however, if there is a lack of such commitment at the top level of organizations, then there will be broad daylight between expectations and reality. In other words, at the strategic level, a pro-diversity mindset is a prerequisite for top-level leadership. They have to acknowledge the fact that diversity can be an instrumental factor for organizational success. Nonetheless, only having such realization is not enough. Rather, organizational vision, mission, and business strategy should give a reflection of those commitments. If there is a dearth of such commitment within the existing organizational culture, then there is a subsequent requirement of bringing cultural change that would foster an atmosphere of mutual respect (Shen et al. 2009). Moreover, if the upper echelons in organizations lack such mindset and intent, as per the findings of "The Great British Diversity Experiment," it will be worthwhile to replace them with new ones (Amway 2018). All these will facilitate in removing both the operational and the psychological barriers in managing diversity (Shen et al. 2009).

To materialize what has been laid down in the organizational vision and mission, organizations should formulate and formalize a series of HRM diversity policies (Reskin and McBrier 2000) at the tactical level. These have been discussed below.

(i) **Recruitment and Selection**

As recruitment and selection is the gateway into the organization, organizations must ensure EEO for everyone that will not only put everyone on an equal footing but also end the chances of discrimination. Most organizations, for instance, IBM, Xerox, and J. C. Penny adhere to the principle of EEO (Ted 2005). While Coca Cola has ensured

**Managing Workforce Diversity Through Human Resource Management, Fig. 1** Managing diversity through HRM. (Adopted from Shen et al. (2009: 245))

that 38% of their new hires are diverse (Hunt et al. 2015). To ensure that diverse people get recruited, scholars like Perlman (1992), Kramar (1998), Allen et al. (2004), and Childs (2005) have advocated few other strategies, such as demographic data analysis and representation of ethnic employees on selection panels. Walmart has put the strategy of demographic data analysis into practice. It conducts such analysis for comprehending the demography of the country in which it operates. Moreover, it has encouraged its subsidiaries in each country to create their own diversity and inclusion plan that would reflect the local needs (Hunt et al. 2015). Again, the Ford Foundation study revealed that, as they hired more minority and female board members in selection panels, it resulted in greater diversity in recruitment (Burbridge et al. 2002). Moreover, interviewers while interviewing a candidate of different color or religion or sex should be extra careful of any sort of biases, prejudice, and stereotyping that might make thinner their chances of being recruited (Shen et al. 2009). Scholars like Cole (2002) also suggested that during screening potential candidates, it is advisable to cross-examine their attitudes and perception toward diversity. If this is not done adequately, then intolerant people might get into the organization with the probable risk of making the organizational environment toxic and less conducive toward managing diversity.

(ii) **Training and Development**

In case of managing diversity-related issues, effective diversity training, according to D'Netto and Sohal (1999) cover three

fundamental areas. First, it ensures equal opportunity for training and development for all the employees; second, it emphasizes diversity training to enhance diversity-related awareness; and third, it focuses on meeting the needs of diverse employees. Diversity training can prove to be extremely beneficial as it will help to inculcate the value of diversity among employees. Morrison, Ruderman, and Hughes (1993) and Kossek and Lobel (1996) argue that it can sensitize employees regarding the impact of stereotypes on their own or others' behavior. However, Shen et al. (2009) rightly noted that returns from diversity training will depend on two factors, first, the content of training, and second, who is delivering it. In other words, diversity training should be so designed such that it has the elements of socio-psychological research on stereotyping and linkages on how to reduce prejudice. While Kossek et al. (2005) opined that diversity training if conducted through facilitators will yield better results, along with diversity training, it's important to provide customized training to a diverse workforce as per their needs. More specifically, organizations should have such a career progression plan for this diverse workforce, so that they can avail necessary training opportunities, grow professionally, and get prepared to take more challenging roles. Few scholars have suggested the incorporation of mentoring programs that will work as a springboard for the diverse workforce to go past the "glass ceilings" (Powell and Butterfield 1994; Ragins 2002). Coca-Cola has been successfully adopting mentoring programs to support the progression and retention of employees from minority backgrounds (Hunt et al. 2015). Finally, to ensure that the diverse workforce is not discriminated against during promotion or career advancement programs, Cox (2001) suggests that those panels should be constituted with a representation of diverse board members.

(iii) **Performance Management**

In order to address the diversity issues, a performance management system should be designed in such a way so that performance appraisal practices are objective (instead of being subjective), fair, and equitable (Schuler et al. 1993). Arguing on the same vein, Fulkerson and Schuler (1992) stated that the appraisal mechanism should not focus on personality or demographic differences; rather it should aim to measure an individual's performance. In other words, they advocated that organizations should make their appraisal system as culturally neutral as possible. While D'Netto and Sohal (1999) opined that inclusion of multicultural managers in the appraisal platforms can greatly help in ensuring objective performance appraisal. Scholars like Loden and Rosener (1991), Morrison (1992), and Schreiber et al. (1993) have also suggested that organizations should provide constructive feedback and must ensure continuous supporting mechanisms in the form of coaching. This will assist the diverse employees to further develop and get themselves well equipped. Organizations can also consider the option of using "diversity management" as a benchmark for evaluating the performance of the managers. More specifically, the upper echelons would evaluate the manager's role in diversity management during the hiring or promoting diverse people into the organizational workforce (Morrison 1992; Sessa 1992; Kramar 1998).

(iv) **Reward Management**

An effective reward management system based on the principles of equal pay and performance-based pay can go a long way in managing the diversity issues as well as attracting and retaining diverse workforces (Shen et al. 2009; D'Netto et al. 2014). In other words, organizations should not discriminate on pay packages of the employees depending on their gender, race, color, religion, nationality, or any other differences, as the earlier studies have found. Rather, they should design the entire compensation system, wage determinants, and benefits in such a way that will reward the contribution of diverse employees equitably, i.e., taking into

consideration of each individual's knowledge, skills, and ability (Brickson 2000; D'Netto et al. 2014). Such a reward system will create harmony among the diverse workforce. Moreover, for developing a cooperative culture and team membership among this diverse workforce, organizations should also emphasize team goals and a collective reward system (Chatman et al. 1998).

Finally, at the operational level, for managing diversity, organizations need to put some additional efforts as suggested by Shen et al. (2009). These include educating employees beyond formal training programs, networking communication, ensuring flexible employment, and providing support for generating work–life balance. Moreover, at all levels, be it strategic, tactical, or operational, line managers should be involved as a fundamental component of HR diversity management (Shen et al. 2009).

## Conclusion

Diversity in the workforce has become an inevitable reality these days. The Great British Diversity Experiment rightly termed diversity as the "New Darwinism." Therefore, as it is to stay and "survival for the fittest" is the way to go, organizations cannot but embrace diversity. Having said that, embracing diversity might not be a straightforward task for organizations. This is because diversity has got both the pros and cons. There is no doubt that diversity can prove to be a game-changer for organizational success; however, if not managed effectively, it can lead to organizational conflict, employee dissatisfaction, absenteeism, and high turnover. The traditional way of dealing with diversity was limited to EEO and AA. However, this entry agrees with the proposition of Shen et al. (2009) and the findings of the Great British Diversity Experiment that the approach of EEO or AA in managing diversity issues is rather a superficial one. On that account, to deal with diversity issues comprehensively, diversity management through HRM can be a perfect antidote. Nonetheless, this prescription will only work provided the upper echelons of the organizations have a pro-diversity mindset that recognizes workforce diversity as a critical factor for business success. Once that commitment is achieved at the strategic level, the reflection of that philosophy will be mirrored both at the tactical and operational levels, i.e., organizational vision, mission, business strategy, and the HRM policies.

Customer orientation

## Definition

Marketing: a managerial function whose purpose is to cause the organization to offer to the marketplace products and services that satisfy consumers' needs.

## Introduction

Marketing is a managerial function whose purpose is to cause the organization to offer to the marketplace products and services that satisfy consumers' needs. The modern marketing concept has succeeded an earlier management mindset that assumed that an enterprise would be successful if it would improve on product design (as in the aspiration of "building a better mousetrap") or enhance its skill of selling to otherwise reluctant customers. Management expert Peter Drucker popularized the concept that an organization's success would be best served if it would explore and identify the public's needs and wants and then provide gratification to the public by delivering products and services that satiate its desires.

Many business firms adopted the marketing orientation, especially as they observed enterprises like McDonald's restaurants and Microsoft earn spectacular profits by satisfying the public's need for the intangible benefits of convenience, simplicity of use, and time-saving efficiency. That fast-food restaurants were offering less flavorful meals and expecting customers in effect to wait on themselves proved to be entirely beside the point. Soaring profits and recurring stock splits caught the attention of entrepreneurs around the world.

Meanwhile, managers of nonprofit institutions disregarded the example of market-oriented business firms, assuming that practices that generated impressive profits were inapplicable to organizations that have no profit-seeking owners. In 1969, marketing experts Philip Kotler and Sidney J. Levy proposed that marketing is an inevitable function of nonprofit management, and the first nonprofit-marketing textbooks emerged in the early 1980s. The effort to persuade nonprofit managers to focus on customer-oriented marketing has met significant resistance, especially as such managers have mistaken marketing for aggressive salesmanship or cutthroat competitiveness.

## Application to the Nonprofit Sector

In the commercial marketplace, sellers and buyers make countless decisions about whether to enter into transactions with each other. Most commonly, cash changes hands and, as the seller and buyer conclude the exchange, each considers herself better off than she was before the transaction. These exchanges are based on satisfying each party's desire to serve her self-interest. The marketing approach is naturally compatible with this

marketplace pattern of participants acting in their self-interest.

Transactions in the nonprofit sector tend to be more complex. For example, a charity soliciting a donation from a donor has the challenge of asking the donor to make a sacrifice, which is essentially the payment of money in exchange for nothing of tangible value. A charity may also solicit unpaid labor from willing individuals, such that the volunteers donate their time and effort in exchange for no compensation. At first blush, most nonprofit managers concluded that the concept of marketing offered nothing to help them attract the resources that they needed to be successful.

Proponents of nonprofit marketing have responded by challenging the notion that donors, volunteers, or other participants in nonprofit-sector transactions would act in a manner that is *contrary* to self-interest. Self-destructive behavior would be irrational. Marketing proponents suggested that an evaluation of the motivations of people and organizations that cooperate with nonprofit institutions is warranted. Identifications of such motivations would be useful in determining how to appeal to the people who have needs that nonprofit-sector transactions satisfy.

## Theory of Marketing

The theory of marketing is founded on the assumption that the authoritative experts about what will make potential customers happy are the customers themselves. Organizations that supply goods and services have a long history of thinking that they know what the public wants more than the public does. This thinking is at least as prevalent in the nonprofit sector as it is in the for-profit sector. Proponents of marketing assert that organizations err when they neglect to do research about the behaviors and interests of potential customers and clients.

An organization, through aggressive salesmanship or even deceit, might succeed in drawing a customer, client, or donor into a transaction but, if the transaction does not result in some level of gratification, the relationship might end then and there. Manipulation may result in one sale to a customer, but there is very little possibility of a long-term benefit.

In brief, the theory of marketing calls on organizations to be *customer-oriented* and to elevate the consumer to the status of centrality in the organization's mindset. Marketing is a *way of thinking* about how to conduct business with potential consumers. Marketing is also a *function* that involves research about the marketplace, design of products and services, pricing, distribution, and promotion.

## Audience of Nonprofit Marketing and Services

A key step in the creation of any marketing program is *targeting*. A business firm will classify the public into groups based on variations of demographic characteristics, lifestyle preferences, and situational needs. Then, the firm will decide which segments to target and will develop products, services, and promotional messages specific to the various segments.

For a nonprofit institution, targeting is also necessary. Furthermore, marketing managers must classify the public by their potential roles, including consumers, volunteers, and donors.

*Donors* would be further classified into the various categories of sources of donated funds: individuals, other nonprofit organizations, for-profit firms, foundations, and governments. In the case of individuals, a charity would evaluate the motivations that cause a person to decide to make a sacrifice for the charity's cause. Sargeant and Woodliffe (2008, pp. 127–133) list these motives:

- Altruism and self-interest
- Empathy
- Sympathy
- Fear/pity/guilt
- Social justice
- Prestige and "making a difference"
- Tax relief

Schervish (2008, pp. 168–176) lists more specific motivators for *wealthy* donors.

- Identification ("[g]iven the strength of identification as the wellspring of charitable giving, it is not surprising that donors contribute the greatest bulk of their charitable dollars to causes from whose services the donors directly benefit" (ibid., p. 168)).
- Gratitude ("[t]he motivation of identification is complemented by a particularly strong sense of gratitude for unmerited advantages or, as some say, 'blessings' in reaching financial success" (ibid., p. 170)).
- Financial security (". . . those who understand themselves as financially secure contribute a higher percentage of their wealth, a higher percentage of their income and a higher dollar amount to charity" (ibid., p. 171)).
- Limiting transfers to heirs.
- The satisfaction of *philia* – i.e., "brotherly love."
- Hyperagency ("[h]yperagency refers to the enhanced capacity of wealthy individuals to establish or control substantially the conditions under which they and others will work and live" (ibid., p. 176)).

*Consumers* are a source of revenue. Nonprofit organizations need to consider other sources of revenue beyond donations. Such sources may include fees and sales of products and services. Therefore, the organization has a greater need to cause its products and services to appear to be attractive to potential customers or clients if a price or fee will be charged, possibly for such intangible assets as education, advocacy, and affiliation.

When a nonprofit organization is offering products or services to customers or clients without charge, a marketing program is still necessary to attract such individuals. Although the clients may not be paying money, the organization still needs them to invest their time, effort, and receptiveness to what the organization wants them to accomplish.

Evidence of the efficacy of such free services, such as marketing evaluations, may be necessary to satisfy the demands of institutional donors – for-profit firms, foundations, and governments – that provide funding that makes the free services possible.

*Volunteers*' unpaid labor is a "free" resource that is vitally important to many nonprofits. For volunteers, there needs to be a process that is as formal as the human-resources process for the paid staff. This includes a parallel hierarchical structure for classification (by their positions' skill and duty requirements), recruitment, supervision, evaluation, and rewards. A poorly executed utilization of volunteers will typically lead to low volunteer productivity, dissatisfaction, and revolving-door turnover. It behooves an organization that wishes to benefit from volunteer labor to treat the volunteer staff as a parallel organization alongside the paid staff. It is an error for an organization's management to conceive of volunteers as the "unskilled" part of its workforce, although that is often what is on managers' minds. Volunteers serve as members of boards of directors, organizers, fund-raisers, field volunteers, and supervisors of other volunteers – positions that often require advanced knowledge, skills, and abilities. Just as there is a hierarchy of employees, there can and should be a hierarchy of volunteers that allows for advancement based on ability and successful achievement.

The management of a volunteer-driven organization can segment the volunteer market and, in recruiting volunteers, use the target-marketing approach to find and attract volunteers. As volunteers are not paid for their labor, their valuable effort can deliver a generous benefit to the organization. However, when volunteers are not utilized productively or when unqualified individuals occupy volunteer positions, even the fact that they are unpaid means little to the organization that is reaping few benefits because of haphazard volunteer management. See also the entry about ► "Volunteers and Volunteer Management".

## Special Traits of Nonprofit Services

The original approaches to customer-oriented marketing focused on the sale of tangible products by for-profit firms. The separate features of services motivated marketing experts to develop different, specific approaches to the marketing of services.

For the marketing of products, a description of *marketing mix* involves what have become the famous "four P's" of marketing: E. Jerome McCarthy explained in 1964 that when consumers consider the purchase of a tangible item, they are actually evaluating the mix of product, price, place, and promotion. As marketing experts contemplated the application of marketing principles to services, they encountered the insufficiency of the "four P's" approach.

Eight characteristics of services necessitate marketing approaches that differ from the treatment of products:

- Intangibility
- High buyer involvement
- Difficulty in evaluating them
- No inventories (services are *perishable*, which means that they cannot be stored for later use)
- Strict time criteria
- Importance of contact points
- Little standardization
- Simultaneous production and consumption

Therefore, a number of scholars have offered an alternative to the "four P's." For example, Booms and Bitner (1981) offered "seven P's" of service marketing: product or service offering, price, promotion, place, physical evidence, process, and people. For the health-care sector, the literature, in many places, suggests transforming the "four P's" into the "four C's," as follows (but with numerous variations):

| | | |
|---|---|---|
| Product | → | Consumer (consumer needs or consumer value) |
| Price | → | Cost |
| Promotion | → | Communication |
| Place | → | Convenience |

Arguably, an even more complex challenge arises in the realm of *social marketing*. Social marketing involves an effort to change the destructive behavior of large numbers of members of the public. Social-marketing campaigns have taken on the objective of changing such behaviors as drunk driving, excessive gambling, obesity and unhealthy eating, smoking, alcohol abuse, and carbon-emitting practices. Other campaigns have encouraged less use of motor vehicles, management of pest control, recycling, energy conservation, composting, and disaster preparedness. In the case of social marketing, Sargeant proposes "six P's": product, price, place, promotion, partnership, and policy (Sargeant 2009, p. 221).

## The Value of the Brand

[Source for photo: International Committee of the Red Cross. (2016). "Syria: First aid in months reaches over 70,000 people in the central Syrian region of Al Houleh." March 23. Caption: "ICRC trucks enter the besieged area of Al Houleh, Syria (ICRC/P. Krzysiek)." Retrieved on October 31, 2016, from https://www.icrc.org/en/document/syria-first-aid-months-reaches-over-70000-people-central-syrian-region-al-houleh.]

Marketing managers in nonprofit organizations owe it to the organizations to nurture their brand. The brand of an organization includes its name, its symbol (logo), its slogan, its spokesperson (whether a human or a cartoon character like Smokey Bear), other designs associated with the organization in the public's mind, and factors that build the organization's reputation. When, according to international Red Cross sources, Swiss General Guillaume-Henri Dufour proposed in 1863 using the design of a red cross on a white field to represent the newly formed committee whose purpose was to "neutralize" medical personnel in warfare so that, instead of being captured as prisoners, they could tend to wounded soldiers, history was made. The centerpiece of one of the world's most recognizable and valuable nonprofit brands came onto the world scene. Those who stand to benefit from this international nonprofit organization's services and those who might support its operations financially or politically are stirred by the appearance of the Red Cross emblem (an example of which the arrival of a Red Cross-emblazoned humanitarian-aid convoy in Syria in 2016 -is depicted in Fig. 1).

Cone Communications, a public-relations agency for consumer brands, evaluated the brands of U S nonprofits in 2009 and found that the most valuable brands are those of the YMCA of the

**Marketing in Nonprofit Organizations, Fig. 1** ICRC trucks enter the besieged area of Al Houleh, Syria. ICRC/P. Krzysiek (The image illustrates the article "Syria: First aid in months reaches over 70,000 people in the central Syrian region of Al Houleh" (March 23, 2016), https://www.icrc.org/en/document/syria-first-aid-months-reaches-over-70000-people-central-syrian-region-al-houleh)

USA, $6.4 billion; the Salvation Army, $4.7 billion; and United Way of America, $4.5 billion. (Various sources report widely diverging brand values. Many value the top nonprofit brands in the tens of billions of dollars.) Brands can be a source of revenue, such as when for-profit firms invest in nonprofits by sponsoring their events, appearing in publications and on Web sites, and loaning out their executives in exchange for having an association with respected organizations.

## Misunderstandings About Marketing

This encyclopedia entry began with the statement, "Marketing is a managerial function whose purpose is to cause the organization to offer to the marketplace products and services that satisfy consumers' needs." Anyone who commits that statement to memory will have a clearer understanding about marketing than 99% of business and nonprofit professionals. In the for-profit sector, many executives think that marketing involves promotion (especially advertising) and public relations. In the nonprofit sector, many executives think that marketing involves – besides promotion and public relations – fund-raising. This is why a chief executive – told that her organization is not doing marketing well enough – will hire a public-relations director or an advertising director or a fund-raising director and believe that her organization is now adequately staffed to carry out the marketing function as well as other organizations do.

But, until the marketing concept is embraced intelligently by the organization, the advertising, public-relations, or fund-raising director will do nothing more than to try to disseminate messages from an organization that has neglected to properly evaluate society's needs and desires and determine how best to satisfy *those* needs and desires. Thus, if the organization is offering goods or services toward which the public is indifferent, the advertising, public-relations, or fund-raising director is likely to spin his wheels as he tries to force on the members of his audience things that they do not want.

Marketing advocates provide the advice that an organization should have an individual not only whose *function* is marketing but also whose *education* is in marketing, so that he is well aware that his job is not confined to public relations and can so explain to others. Furthermore, because so many organizations that have embraced the marketing concept have met with so much success, other organizations should recognize that marketing is not a peripheral function of the organization but rather a *fundamental* function along with such others, if they apply, as manufacturing, distribution, purchasing, finance, research and development, and human resources. Accordingly, a chief executive setting out to give to marketing a visible place in her

organization would reasonably consider the creation of the position of vice president for marketing. In that vice president's division of the organization could be such positions as advertising manager, public-relations manager, and marketing-research manager. Until the marketing concept becomes well known to and accepted by the organization's other vice presidents and managers, the vice president for marketing will need support from the chief executive, in that elevation of marketing to a place of influence in the organization may be a change that others will want to discredit and eliminate, so that things can go "back to normal" for them.

## Benefits

Proponents of nonprofit marketing cite some significant benefits for organizations that adopt the approach of customer-centered marketing.

- Improvement in levels of customer satisfaction.
- Attraction of more resources.
- Enhancement of the organization's ability to "define its distinctive competencies."
- A more coherent framework for "researching needs, setting objectives, planning to meet those objectives, and [instigating] formal control activities to ensure that [the objectives] will actually be achieved" (Sargeant 2009, p. 39).
- Existence of "a paradigm that is more appropriate for the environment in which nonprofits must operate."
- Enhanced perspective about how to facilitate desired exchanges.
- Introduction of measures of performance into the managerial decision-making process.
- Introduction of a terminology that "better aligns the tasks performed by nonprofits with the reality of the marketplace."
- Availability of perspective and vocabulary that is cross-cultural and can guide organizations in dealing with "[c]oncepts such as trade deficits, embargoes, devaluation of foreign currency, price fixing, deceptive advertising, product safety, and unethical selling" (Burnett 2007, pp. 14–15).

## Conclusion

Marketing is actually an inevitable function of every organization that wishes to engage in transactions with consumers in the free marketplace. In some way or another, the head of an organization and her top aides will be speculating about how to attract others into transactions with the organization. The only question then becomes whether an organization will carry out the function adeptly or will approach the marketplace in a clumsy, ineffective manner. An organization that believes that the goods or services that it wants to offer are the right things for consumers to use and that reluctant consumers are misinformed about what is best for them is likely to experience a long struggle to close deals with the public. Many organizations have discovered that their long-term success is best served when they first determine what consumers want and then develop offerings that satisfy what they want. Any organizational leader who has not come to terms with the advantage of offering what consumers want is well advised to reconsider the wisdom of her strategy.

# Marketization of Higher Education

Tom S. Karlsson[1] and Susanna Karlsson[2]
[1]School of Public Administration, University of Gothenburg, Gothenburg, Sweden
[2]Department of Swedish, University of Gothenburg, Gothenburg, Sweden

## Synonyms

Higher education; Internationalization; Language policy; Marketization

## Definition

Internationalization concerns the process by which higher education rearranges scopes and aims to fit global platforms of educational and research exchange.

Privatization concerns the process by which enterprises and organizations, previously publicly governed, are transferred into private or semiprivate ownership structures.

Education as profit-making enterprise concerns an organization that restructures educational curriculum primarily in order to make it appealing for tuition-paying students.

Higher education as a public good refers to it being recognized as benefitting society in total and that it is rendered available for everyone without monetary hindrance in terms of tuition fees.

~~Privatization of education for profitable business.~~

~~Education for business profit.~~

## Introduction

Higher education is usually conceptualized as being autonomous from market and state interventions. Academic scholars have been free to organize and realize educational content on their own terms. One reason for this lies in the academic freedom, which safeguards the pursuit of knowledge and a right to educate students on such knowledge. Increasingly, higher education has been subjected to global trends of *internationalization*. This implies the construction of a global agenda for facilitating student and staff mobility in order to increase student employability across borders and instigate a comparability of different degrees. An effect of internationalization is that competition has been introduced in higher education, leading to changing pedagogical practices and understandings of higher education is. Drawing from economic theory, it can be argued that internationalization transforms higher education from a public to a private good, making it susceptible to market powers. This process can be labeled *marketization*, meaning that higher education becomes a service as any other.

## Higher Education as a Tradable Commodity

The *Bologna Process* organizes 48 countries in creating a unified educational market in Europe. The Bologna Process has as its goal to create a harmonization of higher education in the participating countries, creating a common educational standard that can be used and recognized in European countries. This idea falls in line with the general aim of facilitating free movement for citizens within the European Union and making students more employable in a wide variety of countries and job markets. The key success factor is argued to lie in *internationalization*. With internationalization of higher education, students (and staff) are expected to move within and between different higher education institutions in Europe. *Mobility* is a key performance indicator for the success of internationalization.

Internationalization is embedded in a neoliberal discourse, augmenting a practice of competition between higher education institutions and a market view of citizenship (Robertson and Keeling 2008; Siiner 2016). This has been raised in literature under at least three themes. First, as Brandenburg and De Wit (2015) argue, internationalization is intended to increase *student* and *degree mobility.* In relation to this,

internationalization is also intended to increase *staff mobility*. The two are interrelated, meaning that a higher degree of student mobility will attract more international staff, and vice versa. Second, internationalization *standardizes available education*. In order to facilitate a meaningful and effective student mobility, curriculums are increasingly transformed into something that can be traded (De Vita and Case 2003) and higher education becomes aligned across borders. Brooks (2018) labels it a *homogenization* of higher education. Third, higher education is increasingly understood to be a service as any other. In this respect higher education has globally been subjected to *deregulations* (Jongbloed 2003) and *privatization* (Ball 2004). As higher education becomes transformed to a service as any other, customer and consumer perspectives are highlighted and embedded in higher education culture. This has led to the rise of *degree mills* (Knight 2015) and a pedagogical transformation in which academics are more prone to satisfying students (or consumers) rather than being academic professionals (Ball 2004; Molesworth et al. 2009).

## Higher Education Understood as a Good

In economic theory, all goods (and services) can be discussed in terms of two different characteristics: *rivalry* and *excludability*. Rivalry concerns whether the consumption of a good by one individual hinders or prevents another individual from consuming it or having access to it. Non-rivalry means that even though it is consumed by one individual, there is no prevention from other individuals consuming it at the same time or at a later stage. The good is not and cannot be confined to one owner or user at a time. Excludability refers to how and whether a good can be consumed by an individual. Excludable goods are characterized by prevention, often in terms of having to pay for its access. This means that a good can be excluded from consummation if relevant parties have not paid for it. Non-excludability, on the other hand, means that the good cannot be withheld from consumers on the basis of payment.

If higher education is understood as a good, it would conventionally be understood as something that can be consumed by more than one individual (non-rivalry). If one student partakes in education that does not, by itself, hinder another student from doing the same. Education is, by its very essence, a non-rivalry good. When it comes to who have access to it, a number of different practices and contexts can be found globally. It is not unusual that the state has some form of subsidized or fully financed higher education, which is open for its citizens in different forms. Higher education is understood to be an opportunity for the individual at the same time as it provides society with better equipped labor. Educating one individual will lead to improvements among those citizens that have not undertaken a higher education, as the understandings and knowledge gained within higher education will provide others with benefits, implicitly. This is what economics refer to as spillover effects (or *externalities*). However, it may also be the case that higher education is turned into an excludable good, e.g., by means of high tuition fees. Benefits from higher education may in this way be confined to some individuals, transforming it into an excludable good.

Goods that are characterized as non-rivalry and non-excludability are often unprofitable and need some form of state funding or subsidizing. This is true for a number of different goods, among them higher education. This means that costs for higher education in many cases is a large fiscal cost for states. Given that the market is perceived as a norm, unprofitable goods are often constructed as having a lower status than profitable ones. An effect of this is that states increasingly look to alternative models for governing higher education, such as *marketization*, as it helps to carry public expenditures (Marginson 2007).

Transforming higher education from public to private good is not something that just happens. It is an effect of public policy and policy decisions. This means that marketization (although obfuscated through the use of words such as internationalization) is a deliberate effect of politics. The production of policy will indivertibly affect and change the way in which higher education is perceived in different contexts.

## The Importance of Language (Use)

Higher education institutions are global arenas for exchanging ideas and thoughts, between researchers as well as between staff and students. With the global agenda of internationalization, language use has become an important aspect to govern. When contexts move from monolingual to multilingual milieus, two aspects become important. First, which languages have primacy and when? Second, how are higher institutions handling the presence of multilingual contexts?

For the majority of internationalized higher education institutions that operates in contexts where English is not the primary language, questions concerning language primacy are always present. In such settings, internationalization requires a practice for how to teach and communicate with international students (and staff). The most common alternative to local languages is some variety of English. In fact, it is often required that educational programs on bachelor or master levels be given in English. One reason for this is that English predominantly is considered a *lingua franca*. This means that in order to have a successful internationalization, higher education institutions need to adopt *English as a medium of instruction* (EMI), even though this may be negative in terms of educational quality (Duong and Chua 2016; Maringe 2009). Even under circumstances where international students are expected to have a sufficient proficiency in the local language, internationalization presumes a necessity of EMI. At least two plausible explanations can be found for this. First, internationalization assumes student mobility and employability. In order to produce internationally employable and useful students, higher education institutions must provide an education that can be utilized in many different settings globally. An assumption, then, is that English will make such utilization possible. Second, the competitive nature in which higher education currently exists presumes a language that can (and will) attract new students. It is also presumed that EMI will make it easier to recruit, employ, and maintain international staff, who would be hard-pressed to teach in the local language (should it be any other than English). This means that the introduction of EMI in higher education may be understood as a way to meet the expectations and requirements from international students (Salö 2016).

As English more predominantly becomes the primary language in internationalization contexts, it raises a question of how national higher education institutions cope with the transformation from monolingual to multilingual milieus. A common strategy is for the institutions to construct *language policies*. Such policies can be understood in different ways; one is that it is about language management where some actors have (or think they have) authority over one of several language domains (Spolsky 2004, 2012). From this perspective, language policies can reveal embedded ideologies about languages and the activities a language is linked to (Karlsson and Karlsson 2020). In multilingual milieus it is expected that local languages will be given some form of protection by language policy makers, but also that they formulate directives of when and for what activities other languages can or should be used. Next to local languages, English is the typical such other language mentioned in codified language policies.

It is through such language policies that marketization become observable. It has been shown how advocating certain language's primacy in certain contexts within higher education are based in a need to attract students and staff that perform on high levels. By constructing a policy that has a permissive stance toward English (or other languages) with a clear basis that this is needed to attract international students and staff underscores how higher education becomes a tradable commodity. It is important to understand that it is not the choice or highlighting of English as such that indicates marketization. It is rather the observation that such choice is commonly based in a perceived need to internationalize higher education.

## Conclusions

Higher education is conventionally understood as arenas for exchanging thoughts, challenging

known truths, and exploring the unknown. Trying to do this on a global arena requires that a common knowledge is used so that others may partake in the exchange. This is an upside of internationalization. This language is normally English. This, in turn, means that internationalized contexts, such as higher education, conventionally develop some form of multilingual milieus. The other side is that internationalization leads to a view of students and staff as important factors for success. That is, in order for internationalization to be perceived as successful it requires a certain degree of student and staff mobility. It has furthermore been found that internationalization has resulted in standardized curriculum and a transformation of higher education into a service as any other.

Language policies reveal embedded ideologies about language and linked activities. When arguing for, e.g., English as a medium of instruction as an important factor for attracting new students and staff, this links into a neoliberal discourse of competition between higher education institutions. This means that internationalization as a concept and empirical phenomenon embeds ideas about competing for scarce resources (students and staff) on a global market. From an economic perspective, the transformation of higher education can be understood as a move away from a public to a private good. Higher education institutions are increasingly reconceptualizing programs and education in a way that will attract more students. By making such programs and educations seemingly exclusive by means of accepting a few (top performing) students that pay high tuition fees, issues of rivalry and excludability are introduced. That is, there is a risk that internationalization could lead to educations for a privileged few.

# Marriage and Divorce as Social Policy

Paul Bayer
Regent University, Virginia Beach, VA, USA

## Synonyms

Association; Breakup; Consortium; Dissolution; Matrimony; Monogamy; Nuptials; Separation; Split Wedding; Wedlock

## Definition

Divorce: The legal dissolution of a marriage by a court or other competent body.
Lex loci contractus: Latin for "law of the place where the contract is made".
Marriage: The legally or formally recognized union of a man and a woman (or, in some jurisdiction, two people of the same sex) as partners in a relationship.
No-fault Divorce: Termination of marriage in which irreconcilable differences or irretrievable breakdown of the marriage is citied for the termination of the marriage.
Prenuptial Agreement: Existing or occurring before marriage; terms or conditions agreed to before marriage.
Writ of Mandamus: Order form a court to an inferior government official ordering the government official to properly fulfill their official duties or correct abuse of discretion.

## Introduction

"Destroy the family, and you destroy society," is a quote attributed to Vladimir I. Lenin, the Russian leader of the Communist Revolution, as a politician, and a political theorist (though it may be more correctly attributed to Communist leaders during Lenin's time however). According to Saint Augustine, marriage or more specifically the family, is the basic building block for a society. Considering both Lenin and Augustine's thoughts concerning family, marriage and divorce are two very important issues in the United States today.

Since the beginning of recorded history, the union of a man and a woman for the purpose of procreation, companionship, sexual expression, and financial stability has been a cornerstone of society. As time has progressed, civilization has continued to establish and refine much policy concerning the boundaries and ramifications of marriage. The United States has increasingly implemented new laws set to protect the institution of marriage and oversee an untimely dissolution in the case of divorce. Some of these specific laws governing marriage and divorce include: setting restrictions such as age (18 years old), marriage license recognized by state, and sufficient mental capacity for marriage; divorce includes meeting requirements such as "fault--based divorce" or determining the reason why the couple's marriage has failed and "no-fault-based divorce" in which the couple can claim they are simply incompatible with each other.

Much has changed in the culture of the makeup of the family since the time of Augustine in the third century A.D. Until approximately the 1950s and early 1960s, marriage was considered a fundamental aspect of society in the United States. The idea of divorce on the other hand was considered to be very taboo. It was not until 1969, that the state of California enacted a law in which no fault had to be established for a divorce. The law led to a chain reaction in which *no-fault divorce* was legalized in many states. From that time forward, divorce has become a very commonplace occurrence in American day-to-day life.

As a result there are many questions concerning the topic of marriage and divorce. The entry will seek to answer several key concepts concerning the topic of marriage and divorce. First, marriage will be explored as it is defined today by the state and by the people. Also included in this section will be what is not considered marriage; this is important as the definition of marriage has changed over the past couple of years, as defined by the state and the courts.

Second, divorce will be explored along with the implications of divorce. When a marriage

ends, it is often an ugly affair in which the law is involved. Traditionally there was a need for a burden of proof between two people when they sought a divorce; it was a difficult challenge for lawyers representing people obtaining a divorce in the United States before the 1960s. Since then the field of law and policy governing divorce has substantially grown and now is a well-developed field. It has so much to the extent that a lawyer must specialize in who they represent. Do they represent the husband, wife, children, or the estate? Due to the growth of the field of law governing the policy concerning divorce, a number of questions must be answered including: What is typical procedure concerning divorce? What are different ways to resolve a divorce? How are estates divided? Where do children involved land in the aftermath of the divorce?

Following how the state is involved in divorces, future trends will be speculated upon. In the last century, the definition and parameters of marriage have shifted to such an extent that they seem to resemble a moving target. Is that really the case? If this is true, what are the implications of this? What are common attitudes regarding marriage and will these attitudes play out in the social policies concerning marriage and divorce?

Finally, what are some perspectives from academia? Academics certainly have an effect on the general populace and can influence the thoughts of the public. The public, in turn, elect the government officials who create the policy which governs the people. With that in mind, do academics look at the trends and see potential dangers concerning marriage and divorce? Are there people within the academic community who support future trends? Do some people regard what has been traditionally considered as marriage as moral and correct?

## Marriage as Social Policy

To define marriage and look at where US policy stands concerning marriage, looking first at what is not considered marriage will be instrumental. US law is wide ranging on the topic of marriage despite the fact that the state actually plays a minimal role in governing the affairs of marriage. The state defines what is necessary for a relationship of marriage to be valid, and lays out both the procedures in becoming married as well as the dissolution of the marriage into divorce.

What does US policy entail when it comes to quasi-marriage relationships?

The first place to look is one of the areas outside of legal marriage that is becoming more popular among adults-cohabitation. Cohabitation is the act in which two romantically adults live with each other sharing resources such as bank accounts, food, cars, living space, clothing. Sometimes one or both of the adults bring children into the newly formed relationship and sometimes the adults will pursue more children exclusively with each other. The seminal point about cohabiting is that neither of the adults is looking to move into a marriage contract with each other. If the relationship falls apart while cohabiting, US policy does not protect the equitable results that it does in marriage. Often, the plaintiff is left empty-handed in their pursuits of damages against the defendant.

If the relationship is successful, or if two consenting adults would like to, they can form a registered domestic partnership sometimes known as a civil union. In this model, two adults go before the state and form a contract that states that they are committed to living with each other and sharing resources among each other. There are two issues at hand when considering a registered domestic partnership. The first is recognizing whether or not the state completely limits the partnership through statutes, or whether there are to be benefits that go beyond the statutory limits. To point, say an adult couple comes together in a contract to be in a civil union. One of the two adults has children from a prior relationship and the other does not. If the relationship breaks up, does the adult who had no children have an implied responsibility to the children of the other adult? The other issue is whether a couple can limit their statutory responsibilities before entering the contract.

The answer to the first of these two questions is, it depends. Some states do not give marital benefits to those in merely a civil union. Other states such as Hawaii and Vermont, both give

marital benefits to the adults so long as the adults meet a set of criteria.

The last sort of quasi-marriage relationship to be addressed is a prenuptial agreement. Throughout the history of the United States, the people who most often entered into prenuptial agreements were those who wanted to protect status, wealth, and property that they or their family possessed. In addition to those people, the other common group of people who formed a prenuptial agreement was those who had once been married before. These people formed the agreements in order to protect their children if another divorce would become imminent. The agreement, historically, was not able to secure items such as economic values that were beyond the legality of the power that each party of the agreement had. Today however, courts have imposed policy that attempts to make the process of a prenuptial agreement a fair and equitable process. Each individual is now required to provide full disclosure on their economic situation, and to properly portray themselves as they are. In addition to these criteria, a waiting period is usually established after conditions have been agreed to.

Though marriage encompasses many of the features of the three previously discussed relationships, it encompasses still much more. When it comes to social policy in the United States concerning marriage, it has generally been regarded as a major life changing stage entered into during someone's life. The process of marriage is regulated by the states and has traditionally been one of the last stalwart areas of the law that is still left to the state governments in the United States.

To begin the topic of marriage, how do the states regulate marriage? States have formed expansive policies concerning marriage, its dissolution (annulment in this section), minimum age, marriage in prison, a person's mental competence, incestuous marriages, sex regarding transsexualism, and same-sex marriage, as well as the number of spouses one can have. Each of these areas will be briefly touched upon, and the attempt will be made to show where policy is regarding each of these areas of regulation.

Annulment has been around for a long time dating back to the Catholic Church, a process in which an adult couple can claim that the marriage was never valid in the first place. The process is a recognized area of social policy in the United States today and adults can have their marriages annulled within the US court system. To do so, an adult couple must meet what the courts consider being essential criterion; that is, how did each of the adults portray themselves to each other? If one adult stated they did not want children, while they secretly did desire a large family, this could be grounds for annulment.

Age has been a longstanding regulation of the state when it comes to marriage. In the past, the age requirement to be married was as young as 14 for a boy and 12 for a girl. Today those numbers have changed. In general, with parental consent, young people can get married as early as 16; however, some states allow for 15. The youngest age most states allow young people to get married without parental consent is at the age of 18.

If an adult is in prison and unmarried, can they still get married? US policy would state that yes, they still can get married. In fact, there are regulations about prisons so as to protect the individual's rights to marry. Prisons can delay a marriage (albeit not indefinitely) and set a time for when a marriage can occur. Only in cases where the security and order of a prison are endangered can a prison deny a marriage; however, the act of proving two consenting adults would bring disorder and chaos to a prison though marriage is a tough burden for prisons to provide.

Mental competence is one of the areas in which it can be used as a basis for providing for an annulment. State policy regarding this issue is set forth by the *Larson v. Larson* in which the husband married his wife, despite some of her mental health concerns being known about before the marriage. The plaintiff waited 10 years before he filed for an annulment and the courts disregarded the file stating that he should have filed his paperwork within a reasonable amount of time.

Regarding incestuous marriage, more and more is becoming known about the problems associated with genetics and biology. As more becomes known about genetics, the laws regarding incestuous relationships may be revised.

Generally, incestuous relationships are well regulated in most states. States in the United States have in general, either the prohibition of marriage and/or sexual intercourse.

Transsexual and same-sex marriages have been two areas of social policy that have expanded greatly in recent memory. Each of these topics will be discussed furthermore later in the entry; however, expanded marital rights to both groups have been enjoyed by each people group starting in the 1990s.

What about when two grown adults come together and successfully marry each other? What are some of the common areas in which the state provides policy? The big areas are personal property, obligations of the married spouses, and sexual intimacy and safety.

Before jumping into what the United States' social policy is for these areas of marriage, a concept brought to fruition and practice by the court system needs to be explained. This concept has been the basis for many rulings that courts have provided in cases involving the topic of marriage. That concept is what can be called, "freedom to marry as a fundamental right." The concept seems to be essentially an equalizer when it comes to marriage. Most justices, when quoting the freedom to marry, usually relate the topic at hand to some level of equality. Such as, two people come together and wish to be married despite being of the same sex. As the court rulings have gone in recent years in the United States, the courts look at this particular issue and have increasingly ruled in favor of same-sex couples. The writing of the court usually determines that the Department of Public Health (often who has an interest in determining who can be married) has insufficient evidence of denying same-sex couples marriage; the courts go on to say the couple has a fundamental, even constitutional right to be married. This particular concept also plays out in an already established marriage which will come to light in the following text.

A good point for relating the equity found in the freedom to marry concept is found in property. Traditionally, marriage has been seen in the United States as two people coming together as one; the woman essentially becoming nothing more than an extension of her husband in which he becomes her main provider, property owner, and status. Over the last half century, marriage has become more equitable as a woman has more economic claim in a marriage than she has ever had before. Today, women are not left destitute if a marriage fails, with the husband taking the property and the money. The courts do their best to determine who gets what, and they try to split the estate half and half. There are factors that change or even prevent an exactly equal share such as which spouse contributed the most money for the house, or the cars. Today, many wives hold title to property with their spouses, as "tenants by the entirety, with rights of survivorship." This clause allows the couple to hold title to a property together, the marriage itself is almost a legal entity of its own.

Obligations of married spouses are another large area of the field of law that provides policy for how things should function for a married couple. There are three areas of obligation that are most important here: parents taking care of children, adult children taking care of adults, and spouses taking care of each other.

For parents taking care of children, the courts often look at the structure of the relationships and how the individuals treat the children. It is often a very, if not the most contested area in a marriage when it comes to legal obligations. Most often, if a marriage fails, the father will be responsible for support of the legitimate children. More often than not, the courts declare the mother is responsible for the children if they are illegitimate children. Parents raising children together are fiscally responsible for their children. As it has been determined by precedence set forth in case law, parents can be held to be responsible for their children's higher level education as some parents have been taken to court by their children with the courts forcing the parents to pay for their children's education.

What about in the cases of stepparents? There is no clear cut policy, as it depends on the case scenario. A stepparent will likely be released of fiscal responsibility of the marriage fails unless they took it upon themselves to be the fiscal caretaker of the adopted or stepchild.

In the United States, social security is used as a means of securing a family or individual

economically. It is rather modest in terms when compared to other western industrialized nations. Social security is used today by many retired Americans. As a result, many adult children are free from taking on the responsibility of taking care of their elderly parents.

In the obligations between spouses, here it can be seen that equity in marriage is key in providing more rights for women. For example, if a husband dies intestate, his estate will pass to his wife through policies laid out by the state. If he has children, his wife is usually entitled to at least one third of the total estate before the children have their fair shares. In recent times, marriage has evolved into an economic partnership in which each spouse contributes to the economic being of the marriage.

Finally, in marriage, policy concerning sexual intimacy and safety has continued to grow rapidly in recent years. Half a century ago in the United States, when a man and woman married, two became one in the man. The wife was completely subservient to her husband by taking care of the house, the children, and by taking the man's last name. A woman was even expected to give up her own bodily rights to her husband. As time has gone on, women are more on equal grounds in marriage with men. Today many women keep their maiden name as a part of their last name, and many women make significant contributions to the economic well-being of the marriage. This equity in marriage has led to protections for women in marriage as well. In 1994, the Violence against Woman Act was passed in Congress. Though repealed by the Supreme Court, the law was telling of the times. Today, women have protections against marital rape, which can be in the form of a civil restraining order preventing the man from being in the woman's presence. Finally, when there is violence in a marriage, the spouse of the injured spouse is often the first and prime suspect. Clearly today, there are more protections for spouses under United States Law.

## Divorce

Divorce, like marriage, is a social issue that the state takes great interest in as it has a stake in both of the spouses' interests and any children under the spouses. Each member of the family has the potential to live within the state, and they can either make contributions to the state or they can be detrimental to society. As a result of the potentials, the states have all written statutes which govern the process of divorce such as providing guidelines on how to divorce, and also by providing guidelines on what happens after the divorce. The first key area to look at then is how does the state decree that a married couple can divorce each other? When two adults are married and domiciled in a state, they can also get a divorce within that state by meeting the state's residency requirement. Most states require residency in which two adults seeking a divorce must be a resident of the state they are seeking the divorce within. The reason being is the state has a compelling interest in the marriage. Within the realm of the marriage is the path for procreation which is a necessity for the state. The residency requirements are used to provide time to consider the divorce before the divorce is carried out. It once was the case that most states had a residency requirement of living within the state for 1–2 years before the divorce could be completed. Today, almost all states still have a residency requirement (with the exceptions of Alaska, South Dakota, and Washington) in which two adults must live in it for a time. The longer the requirement, it could be inferred the more seriously the state takes the marriage and the preservation of the marriage. States like Nebraska, South Carolina, and West Virginia all require a year of residency before someone can proceed with the divorce.

Establishing fault in a divorce has historically been a huge part of divorce proceedings. The United States divorce proceedings are based on English Common Law and have thus traditionally been adversarial. In these fault-based divorce proceedings, one adult must show the court that their spouse has acted in a manner that compromised the integrity of the marriage whether that be infidelity, verbal or physical abuse, desertion, and/or cruelty. To convince the judge to grant a divorce, the injured spouse had to prove one of these elements. For the injured spouse, infidelity and

perhaps physical abuse would not be as hard to prove as it would be to prove that their spouse has deserted them or been cruel to them. The majority of states today still practice fault-based divorce. If the divorce is granted by the judge, the divorce ruling can have major implications for the spouse that was the injurer in receiving their part of the marriage estate.

A new system, a no-fault divorce system has been gaining popularity in the states since California first implemented it in 1969. In a no-fault divorce, it only takes one spouse to cite "irreconcilable differences" with their spouse to obtain the divorce being granted. The goal of this system was to replace the adversarial system and grant a fifty-fifty split in the estate of the marriage. Though the system does not always grant an equal fifty-fifty split, it does, however, do a better job of differentiating what each spouse brought to the marriage. The court looks more at who earned what, paid more for the house, car, boat, etc., who rehabilitated the property, and other factors in the marriage to determine who gets what after the divorce. Thanks to the no-fault divorce system, title to property is no longer de facto given to "he who holds title takes the property." More often than not today, whoever is the primary caregiver to the children, will usually inherit the home.

Who gets the children? Child custody has become a heated area of the law. Typically, the judge in the case renders who will receive the children through his own discretion. The trend has been to try and codify standards in which it is decided who gets the children today. The child will go to the parent based off of the judge's interpretations of the standards. Some of these guidelines include the primary caretaker preference, what is in the best interest of the child, and joint custody. The primary caretaker preference is what it states it is in the name. The adult who is known or found to be the primary caretaker is the one who would get the children. The mother is often the recipient of the children when this guideline is used as it often is the mother who primarily takes care of the children. When a court goes with what is best for the child, they look at a number of factors such as: who does the child want to stay with, who will the child be the safest with, who can provide for the child fiscally. Then there is joint custody which has grown in popularity despite the fact that it requires cooperation on both of the spouses. Cooperation is required as both of the spouses will be making decisions together about their child. The child, on the other hand, is able to continue their relationship to both of their parents. For the joint custody approach to be successful, it all hinges on the cooperation of the parents.

## Trends in Marriage

With policy having been laid out, what is the future of marriage and divorce in the United States? It might be said that marriage has become more "optional" in the younger generations in the United States. Since no-fault divorces grew in popularity after becoming legal in California, divorce rates rose, peaked, and have fallen slightly though remained consistent. Marriage has been replaced by cohabitation and a change in attitude about marriage as cohabitation rates have been soaring.

Since the 1980s cohabitation rates have risen. Women surveyed as to whether they had ever cohabited jumped from 30% stating that at some point in their life they cohabited to as much as 61% stating they have cohabited at a point in their life. In the 1990s more than half of all marriages were preceded by a cohabiting relationship. As stated in the text above, cohabitation is a quasi-marriage relationship. It has similarities to marriage, but the relationship is not recognized by law as marriage. Despite the rise in cohabiting relationships, marriage is still held as an ideal. Cohabiting is a means of testing the relationship or having the benefits of marriage without the cost of marrying.

An interesting trend as a result of increased cohabitation is the view of the younger generations who have come out of the cohabited relationships. Adults today, 35 years and younger overwhelmingly support same-sex marriage (70% of adults

35 and younger favor same-sex marriage). An inference of the logical trend of cohabiting once being taboo, to being accepted, and same-sex marriage once being taboo and now accepted might mean further changes in marriage will be likely. Is it possible bigamy will be promoted by the future younger generations? Might marriage lose some of its protections of the state? These questions will require further research in time.

## Perspective from Academic Community

Marriage, as it can be seen from the above text, is something the state has a great interest in and arguable in the preservation of marriage. There is a sentiment in the United States in which divorce is held as undesirable due to the social ills that are often produced with a divorce. The number of divorces held in the United States has been on the rise since the 1970s and continues to hold steady. It may be a result of the no-fault divorces becoming more popular or as a result of relaxed government limits on divorce proceedings such as the residency guidelines. As was mentioned earlier, what might the academic community think about marriage and divorce? This section of the entry will briefly explain conservative views held by the academic community.

What is the argument that favors a more traditional marriage? An argument from the academic community starts with the basic understanding of marriage: that marriage is a relationship of permanency, for better *or* worse; it is a relationship in which procreation is a key aspect of marriage (Lee and George 2014). Marriage is an institution that was created well before the state was. Today the state has tried to claim that it determines what a marriage is. Marriage, however, is a bodily, emotional, and spiritual bonding of adults, in which the natural step in marriage is to rear children together. Due to the unique relationship of marriage, anything outside of it is not marriage. For example, cohabiting couples are not bonded bodily, emotionally, and spiritually as a married couple are. A same-sex marriage is not bonding bodily as a marriage is, as there is no potential for procreation.

## Conclusion

Marriage has evolved in the United States over the last 60–70 years and the potential for further changes seems likely. The trends of cohabiting have risen, and same-sex marriage is now legal. There is a good chance that marriage will continue to change in the future and evolve and time goes on. Despite the changes marriage has undergone in the United States, it is still the ideal for many adult couples in the United States. The state has recognized the shifting attitudes about marriage in the United States and has adjusted policy according to it. Today, it is easier to get married, easier to divorce a spouse, and it has become clearer for the implications for both decisions. There are further areas for study regarding future trends, and any studies will be of great interest for the states' greatest interest in marriage is procreation. Whatever may be the next outcome in marriage, the state will be there to oversee the outcome and to attempt to provide the appropriate policies for the outcome.

# Marxist Theory of Organizations

Osaore A. Aideyan
Department of Politics and Government, Illinois State University, Normal, IL, USA

## Synonyms

Contradictions between activity and outcome; Forces and relations of production; Labor and product; Organizational contradiction

## Definition

A theory that sees organizations as objective historical outcomes of practical collective activity, especially activity organized around the production of material life and the production of social life.

## Introduction

Compared to other classical organizational theories – scientific and administrative management – Marxian theory of organizations presents a rather unfamiliar view of organizations since Marx himself provided little in terms of a theoretical analysis of organizations. As a result, Marxist ideas have been interpreted and appropriated in a number of different ways leading to a number of competing schools of Marxism on organizational forms. Among the competing schools are structural, humanist, determinist, political, economistic, and autonomist. Underlying these different schools are several common categories and propositions that can be traced back to Marx's writings, in particular the concepts of productive forces, and social relations of production are specified in a range of classical and emerging topics in organization studies such as work organizations, public bureaucracies, and courts of law (Heydebrand 1977); bureaucracy, professions and professional firms, and families and households (Adler 2011); organizational learning and communities of practice (Ingvaldsen in Vidal et al. 2015); knowledge work, teamwork, and collaborations (Adler in Vidal et al. 2015); and organizational change, routines, and path dependency (Maielli in Vidal et al. 2015). Taken together and in comparison to scientific and administrative management which focuses on management of work, workers, and issues concerning work, Marxist theory of organizations focuses on material dialectics which takes the mode of production as the engine of structural stability and cohesion and conflict and change.

As an alternative approach to organizational theory, Marxist theory according to Heydebrand (1977) aims to espouse a deeper, underlying structure of organizations by emphasizing the grounding of organizational forms in the social relationships existing in society, which are enabled by specific historical conditions.

While scientific and administrative management focuses on management of work and workers and issues concerning overall organizational structure, Marxist theory in contrast focuses on how the management of work and workers occurs within the structures of global capitalism. Accordingly, any attempt to understand how tasks are performed in organizations must be situated in the context of a broader understanding of the processes operating in global capitalism.

In addition to presenting an unfamiliar view of organizations, Marxist theories of organizations are also discomforting as they argue that the effects of global capitalism are to ensure that the powerful and wealthy continue to prosper at the expense of the powerless and poor.

Like all theories that have been influenced by Marxist writings, contributions of Marxist scholars to the analysis of some key organizational forms share the following key Marxian views.

## Few Basic Categories and Propositions of Marxian Analysis

The first category and perhaps the central contribution of Marxian social theory that is shared by organizational theorists is the view that the social world should be analyzed as a totality. Of

immediate interest here is the call for an integration of diverse strands of approach to the understanding of the social world, an approach that offers a robust platform for combining historical depth with interdisciplinary breadth (Vidal et al. 2015).

A second key element of Marxist thought, which serves to emphasize further the call for interdisciplinary approach, is the materialist conception of history (Hobden and Jones 2014). The central contention here is that processes of historical change are ultimately a reflection of the level of economic development of society. Effectively, economic development is the motor of history. The central dynamic that Marx identifies is the tension or contradiction between the means and relations of production (dialectical materialism) to the development of industrial capitalism. Together, the means of production and the relations of production form the economic base of a given society. As the means of production advances, existing forms of production become obsolete and fetter restricting the most effective utilization of the new productive capacity (Hobden and Jones 2014). This process leads to societal change whereby the relations of production are transformed in order to better accommodate the new means of production. This means of production conditions other aspects of life or the superstructure – social, political, and intellectual (Marx 1970).

From this perspective, according to Heydebrand (1977), the historical formation of the forces and relations of production is merely a special case of the fundamental process of ongoing human practical activity which, in the course of human history, is confronted not only with nature but increasingly with its own products. In the language of Marx, this human activity or praxis tends to come in contradiction with the practical activity of social groups and hence conflict (Marx 1904). Building on this proposition, organizations are conceived as established structure (outcome) and process (activity).

The third key element of Marxist analysis which seeks to emphasize modes of production is the conceptualization of capitalism. Embodied in his work *Critique of Political Economy*, Marx presents the capitalist mode of production as a process that emerged when the forces of production reach a level of sophistication where they can only be deployed effectively under a complex division of labor based on the commodification of labor (Vidal et al. 2015). This process of labor commodification happens through a process of violent dispossession that deprives workers of alternative ways to access consumption or production resources and thus forces workers to exchange their capacity to work for wage as if this capacity too were a commodity produced for sale in the market. The corresponding relations of production are defined by two, more specific relations – a relation of competition among producers or the capitalist class and the wage relation subordinating workers to managerial authority of the firm that employs them (Adler 2011). In this system, goods and services are exchanged as commodities in markets producing profits for capitalist enterprises. These profits stem from surplus values extracted from workers.

A fourth conceptual core of Marxist economic analysis is class. Class is particularly important for understanding the absence of harmony of interests between various social groups in society. Marxists hold that society is systematically prone to class conflict, in particular capitalist societies. The main axis of conflict is between the capitalists (bourgeoisie) and the workers (proletariat).

## Marx-Inspired Thinking About Organizational Forms

When applied to organizations, a dialectical-historical conception defines organizations as the concrete structural manifestations of social institutions that are more or less established outcome of historically specific human practical activity. Leaving aside the differences among the many schools of Marxism in organizational studies, we focus on what we consider as the core concepts, assumptions, and propositions that enrich our understanding of traditional and emerging topics in organization studies.

While organizations are themselves sites of contradictions, they are like other social structures part of a larger political economy, a macro-social and historical context, and particularly part of a

historical formation in which a given mode of production is tending toward dominance over others. The basic contradictions within the political system of advanced capitalist states, for example, that between the state and economy and labor or within capital itself, will be reflected in the formation and transformation of almost all types of organizations (Heydebrand 1977).

Unlike the traditional functionalist, organicist conceptions of organizations, Marxist theory focuses primarily on the conflictual aspects of employment relation and the ramifications for the structure and function of organizations (Adler 2011). This distinctive feature of Marxist approach compared to other conflict theories is attributing the deep cause of conflict to exploitation rather than to domination by authority noted in the works of Weber and Dahrendorf. Accordingly, in organizations devoted primarily to productive activity, the crucial internal contradiction arises from policies designed to rationalize work activity and the historical outcome of this process, namely, a system of authority relations based on the division of labor and, most importantly, on the control of labor (Heydebrand 1977).

A major contribution of Marxist perspective on organizational forms is its conceptualization of the role of bureaucracy in capitalist production and under socialism. Using Wright's (1974 in Adler 2011) critical Marxist account of bureaucracy as one form of bureaucratic analysis, bureaucracy in contrast to Weber's classical account is prevalent not because of its efficiency but because it is effective as a form of domination appropriate to exploitative capitalist production relations. In comparison, the optimistic view Marxist account of bureaucracy represented by Adler's work (2006) sees bureaucracies as performing dual roles; as part of the forces of production, it is seen as a powerful social organizing technology that enables the effective functioning of a group of workers. As part of the relations of production, it is a coercive mechanism for exploitation.

Under socialism, which Marxist like Lenin argues is a superior form of social organization, the tasks of government and the bureaucratic administration would be simplified so they can be performed by every literate person rather than only by specialized functionaries in the classical Weberian sense. In addition, bureaucrats under socialism would be elected and recallable, and they be paid wages comparable to other workers. As an example, Hearn (1978) argues that during the Chinese Cultural Revolution, Mao and the leadership of the Chinese Communist Party sought to create a form of bureaucracy that avoided the risks of technocratic domination by a combination of politics in command and the mass line. This strategy following Marxist mantra of empowering everyone gave lower-level functionaries and citizens at large some say in their relations with the bureaucracy.

Marxist concept and proposition are also useful in understanding the role managers play in organizations. This role according to Adler (2011) is better understood in the context of the growing complexity and size of firms along with their progressive bureaucratization, which has led to considerable growth in the number of managers. Accordingly, in Marxist account, managers play a contradictory role. On one hand, they are agents of capitalist exploitation, and on the other, they are coordinators of a complex division of labor and part of the collective worker. Put in another way, managers are agents of control and profit maximization.

Building on the foundations of Marx, more recent Marxist works on organizational studies have focused on the proliferation of alternative employment arrangements (part-time, interim, and contract work) or what is known as contingent work, the emergent insecurity of regular employment, and the movement toward outsourcing of jobs. From the perspective of critical Marxists, these new forms or works fragment existing collectives. More specifically, they undermine the modest countervailing powers that some workers have managed to establish through union activities (Adler 2011). From the perspective of optimistic Marxist, these new forms of employment arrangements while exploitative are in some cases a reflection of the deepening social division of labor, as activities are aggregated to form into new industries.

Under the rubric of feminist approaches to organization studies, Marxist theory of

organizations offers some useful lenses for understanding families and households (Calas and Smircich 2006). As an organizational form, the family is undergoing considerable change. For example, the rise of single-parent households and the increasing involvement of women in wage-earning workforce have deeply transformed the family. A key contribution of feminist work to Marxist understanding of organizational forms has been to challenge accounts of the relation between the realms of production and reproduction. In the broad field of feminist studies, many scholars (Acker 2000; Acker and Van Houten 1974; Smith 2002) argue that the production process presupposes a reproduction process, where men and women play different roles in these two processes, and that these differences are interrelated. Likewise this interrelation is important for understanding not only the structures of family and nonwork life but also for understanding the role of gender within production relations.

Network organization is another theme that Marxist theory offers some useful insights. Since the days of Marx, Marxists have predicted the growing concentration and centralization of industry and a tendency toward the domination of major industries by large, bureaucratized oligopolistic firms (Sweezy and Baran 1966 in Adler 2011). The major task of these large firms is to link smaller, more focused firms in highly adaptable customer-supplier relationships. In typical Marxian analysis, these relationships are nothing but structures of domination (Fields 2004).

The history of Taylorism and scientific management has attracted a sizeable literature inspired by Marxism especially its effects on specific organization (Nelson 1992) and its use in the public sector among others (Schachter 1989). More like Marxist views of classical bureaucratic analysis of Weber, Taylorism is often considered as not only a management technique but a template for capitalist exploitation of labor. As Braverman (1974) notes, it is management's program of real subordination made explicit. A less critical Marxist view of Taylor's scientific management is found in the works of Nelson (1980) and Kelly (2005), who on the basis of empirical observations show that Taylorism has brought improvements in the terms and conditions of employment for many workers.

Given the key roles of control and exploitation to Marxist theory as highlighted above, Marxist organization studies have naturally paid attention to how workers respond to control and exploitation. Adler (2009) identifies alienation, consent, and resistance as the three forms of responses to capitalist control and exploitation. Alienation refers to the structure of relations of production that deprive workers of control over the end and means of work activity (Jermier 1985). Using Gramsci's concept of hegemony, Marxist organization scholars argue that consent is typically a mix of acquiescence, internalized ideology, and coercion (Burawoy 1990). Resistance refers to collective struggle by workers through union activities to gain recognition and autonomy.

## Conclusion

Built on an interdisciplinary analysis of human history and the dynamics of capitalist development as a distinct mode of production, Marxist theory of organizational studies offers greater historical understanding of the origins of contemporary events and to differentiate more confidently between those events that portend radical changes of the status quo and those that reflect adaptation (Vidal et al. 2015). Events and phenomena we observe today may inflect historical trends.

# Mass Incarceration in Urban America

Felix Kumah-Abiwu
Center for African Studies, Department of Pan-African Studies, Kent State University, Kent, OH, USA

## Synonyms

Confinement; Detention; Imprisonment

## Definition

Incarceration or imprisonment is defined as a legally imposed deprivation of personal liberty after a person is found guilty by a court of law for serious crimes defined as felonies by federal and state legislatures (Travis et al. 2014).

## Introduction

The USA does not only share many commonalities with advanced democratic societies in the world, but it is often described as the "Leader of the Free World" with admirable democratic values worth emulating by other nations. At the same time, the USA, unlike other major Western societies, finds itself in the category of authoritarian countries such as Russia and China with high prison populations. The USA constitutes about 5% of the world population, but it has more than 25% of the world's total prison population (De Giorgi 2015), making it the number one country in the world with the highest prison population (Turney 2014; Alexander 2012).

While the prison population is reported to be on a slight decline in the last few years, Thorpe

(2014), as other scholars (Manza and Uggen 2006), noted that the US prison population has not only increased more than 600% since the 1970s, but two-thirds of the incarcerated people are serving prison sentences for nonviolent offenses such as property theft and drug offenses. Prior to the last few years when the prison population has seen some declines, as noted, De Giorgi (2015) observed that the USA had about 2.3 million people imprisoned with about 4.7 million on parole or probation making a combined total of 7 million people under some form of penal control in the criminal justice system. While scholars and policymakers have raised concerns about the disturbing mass incarceration trends in America, a critical question that has not escaped the attention of observers of the incarceration terrain centers on the racial disparities of the prison population. In other words, America's prison population is disproportionately composed of racial minorities from urban communities, especially African American and Hispanic males (Thorpe 2014).

The factors that have driven and continued to drive mass incarceration in America are subject to contentious debates. For some, the never-ending presence of crime, gang activities, trafficking, and use of hard drugs such as heroin and cocaine in many communities, especially urban communities (Clear 2007; Travis et al. 2014; Simes 2018), have been used to explain the rise in mass incarceration. Others explain the mass incarceration as a product of profit-motivated prison industrial complex system, school-to-prison pipeline practices, and the reliance on the prison system by some communities for economic survival (Douglas et al. 2018). For others, the narrative of the so-called "law and order" rhetoric for political mobilization (Travis et al. 2014; Nadelmann 1990) and race as a factor cannot be ignored in explaining America's mass incarceration. In other words, mass incarceration is significantly shaped by race and how race (Black people) has often been linked to "criminality" (Alexander 2012; Travis et al. 2014).

For a concise overview of the discourse on race, class, urban communities, and America's criminal justice system, this entry examines mass incarceration in urban America and the wider implications on African Americans. The entry is organized into two parts in examining these issues. The first part examines the evolution of America's mass incarceration from the 1970s to the present era. This part also explores some theoretical ideas or underpinnings in the evolution of mass incarceration. The second part discusses the implications of mass incarceration on urban communities with a focus on African Americans. The entry concludes with some policy ideas and recommendations on America's criminal justice system.

## Overview of Mass Incarceration in America

In his almost a century-year-old publication on the origins of America's prison system, Harry Barnes observed that the penal or prison system originated in ancient times and became institutionalized with societal changes over time (Barnes 1921). At the beginning of the eighteenth century, for example, the penal system was largely applied to political and religious offenders as well as debtors (Barnes 1921). Colonial America produced what Barnes (1921) describes as the modern prison system that was characterized by jails and workhouses. For Enns (2014), the rise in America's prison population could best be explained by the popular embrace of *punitiveness* as a social concept and preference by political actors and the general public.

While the idea of *punitiveness* provides some useful insights to better understand society's embrace and practices of imprisonment as the preferred choice for punishments in the slavery and post-slavery eras, Gilmore's (2000) work on slavery and America's criminal justice system has, however, argued that prisons might not have been a direct extension of slavery, but the strong link between institutionalized and systematic racist laws that were introduced in the post-slavery era created fertile grounds for the growth in the imprisonment of African Americans (Gilmore 2000). For example, the segregated or Jim Crow laws of the American South from the late 1880s to the early 1950s not only deny African Americans their basic civil rights (Butchart 2010), but severe

penalties for so-called "crimes" such as loitering, vagrancy, and public drunkenness among others were introduced and aggressively enforced. To Gilmore (2000), the institution of slavery was not only racialized, but the system of slavery was also built on coercive labor. In the same vein, one can understand the current patterns of mass incarceration through the interconnections between racism, criminalization, and labor in the post-slavery era (Gilmore 2000). As Cavadino and Dignan (2006) have suggested, America's mass incarceration is shaped by the conception of criminality, race, and public preference for severe punishment for decades. It also involves the intersectionality of societal/cultural factors, perceptions, historical narratives, and social norms of who "perpetrators" and "victims" of criminal acts are "expected" to racially look like (Cavadino and Dignan 2006). This is where it becomes essential to underscore how "blackness" has been historically defined, framed, reframed, and portrayed in America's violent criminal justice system (Thorpe 2014). This violence of mass incarceration against minority urban communities seems not to represent what Thorpe (2014) describes as the ideals of resistance to violence that America was founded on as a nation. Instead, mass incarceration challenges one's imagination of how the American society has become so tolerant to the violence of imprisoning its citizens than any other country in the world (Thorpe 2014).

## Explaining Mass Incarceration in Urban America

Before examining the main explanatory factors of America's mass incarceration, it would be useful to briefly discuss some theoretical underpinnings that have shaped research works on mass incarceration. This entry draws on Simes' (2018) review of two main perspectives from the literature for the discussion. The first is the *urban inequality perspective*. This perspective underscores the argument that a number of poor neighborhoods in urban cities tend to experience high levels of incarceration because of the connection of urban areas to spatial distribution of crime (Simes 2018; Clear 2007; Travis et al. 2014). The second is the *social control perspective*. While this perspective acknowledges the high rates of incarceration in urban neighborhoods, scholars of this perspective argue that high incarceration is a process of social control of racial minority groups who have been segregated to urban locations and dislocated from mainstream social and economic opportunities (Simes 2018; Goffman 2014). Broadly, as Simes (2018) has suggested, socioeconomic difficulties such as poverty and lack of opportunities have some connection to crime and incarceration.

The two perspectives provide useful theoretical lens in advancing our understanding of mass incarceration in urban America, but race as a critical factor, as articulated in the central thesis of the *critical race theory* (Bell 1992), might provide a more persuasive explanation for America's mass incarceration. The main conceptual idea of the *critical race theory* highlights the argument that institutionalized racism does not only occupy a dominant place in the American society, but issues of race and racism permeate key areas of the society such as law, popular culture, media, policy, and public/private institutions (Bell 1992; Orelus 2013). Critical race theorists also argue that race as a factor is more likely to directly and/or indirectly influence decisions of individuals, groups, and institutions as race is often employed as a powerful tool in the marginalization of minority groups, especially African Americans (Bell 1992; Delgado and Stefancic 1995; Kumah-Abiwu 2019a).

What factors then explain America's mass incarceration? The next section discusses these factors with supporting examples. For clarity purposes, the section is discussed from two standpoints. The first explores the evolution of the "war on drugs" as a major explanatory factor in shaping mass incarceration in America. The second examines federal drug laws and punitive policy responses in the enforcement of these laws as other factors that have shaped America's mass incarceration. Also discussed is the politics of framing the war on drugs with the so-called law and order political rhetoric from the 1980s onwards.

## The War on Drugs

The 1960s was a turbulent period in America's history that was not only characterized by civil rights and anti-war protests, but the era also witnessed a surge in the trafficking and use of narcotic or illegal drugs (Nadelmann 1990; Kumah-Abiwu 2012, 2014). The use of narcotic drugs was unlawful in most cases, but hard drugs such as cocaine and heroin were also associated with the rich and famous (Musto 1999). The drug surge was mostly fueled by cultural forces of "anti-political establishment" views among college students who were part of the anti-war movement of the 1960s (Musto 1999; Ferraiolo 2007). Strangely, the use of marijuana became a "glorified phenomenon" in the American popular culture, especially in songs and movies with links to the anti-war movement (Ferraiolo 2007). Confronted with these social challenges, President Richard Nixon redefined the drug issue as America's "public enemy number one" and declared an all-out "war" on illegal drugs in 1971 (Musto 1999; Kumah-Abiwu 2012).

Two schools of thought exist among scholars on Nixon's declaration of the war on drugs. For some, Nixon declared the war on drugs as a policy response to the worsening drug problem of the era (Bertram et al. 1996). For others, Nixon's declaration of the war on drugs was a fulfillment of his law and order and tough-on-crime promises to the American people during his presidential campaign (Bertram et al. 1996). Regardless, the evolution of the so-called war on drugs changed America's prison landscape through various federal drug laws that were passed by Congress and state legislatures since the 1970s. The next section discusses some of the federal drug laws and their consequences on urban America.

## Drug Laws and Mass Incarceration

One of the strategies Richard Nixon adopted after declaring the war on drug was to renew the politics of issue framing (Kumah-Abiwu 2017) and the pervasive public perception regarding the "link" between drug use and criminal activities as the basis for his drug control policy (Bertram et al. 1996). On the legislative front, for example, the Comprehensive Drug Abuse Prevention and Control Act (CDAPCA) of 1970 was Nixon's major drug control law that was passed by Congress (Musto and Korsmeyer 2002). One of the key elements of the law was the creation of five categories of controlled substances, also known as schedules, a method for determining the possible abuse of controlled substances, harmfulness, and potential use for medical purposes. Marijuana was classified under schedule I with hard drugs such as heroin and deemed as a potentially dangerous drug for abuse (Sharp 1994).

Unlike Nixon's war-like narcotics policy, the drug war rhetoric briefly deescalated in the Administrations of Gerald Ford and Jimmy Carter (Sharp 1994) in the late 1970s, but reescalated from the 1980s onwards when Ronald Reagan became president (Goode 2005). Not only was the war on drugs intensified with punitive anti-drug laws, but the emergence of crack cocaine in the 1980s (Ferraiolo 2007; Sharp 1994) and the use of it in urban communities changed the calculus of the war on drugs and the growth of incarceration across America. Two major changes occurred with respect to how the war on drugs was pursued. First, stricter federal and state drug laws were enacted with aggressive enforcement in poor urban areas. Second, the drug laws galvanized mass incarceration of nonviolent crimes in many of these urban communities (Goode 2005).

Describing the drug laws of the Reagan era, for example, Wisotsky (1986) noted that the legislative offensive by the Reagan administration against the trafficking and use of narcotic drugs culminated into the passage of the 1984, 1986, and 1988 anti-drug laws. These laws were not only punitive (Ferraiolo 2007), but their key provisions included mandatory minimum sentences for drug offenders based on the amount of powdered or crack cocaine found in the possession of offenders (Musto 1999; Kumah-Abiwu 2012). A case in point was the 1986 anti-drug law. The law provided stiffer punishment for all drug offenders, but the punishment for crack cocaine drug offenders was different from powdered cocaine drug offenders (Musto 1999). For example, the penalty drug offenders receive for the possession of 5 g of crack cocaine was equivalent to the penalty for the possession of 500 g of

powdered cocaine with prison sentences ranging from 5 to 40 years (Musto 1999). In the words of Reinarman and Levine (2004), the crack and powdered cocaine dichotomy shows the class and racial elements of people who use these drugs. For instance, powder cocaine was mostly used in private settings among more affluent white Americans, while crack cocaine was sold and used in inner-city street corners. Similarly, powder cocaine was often sold in half-gram or one-gram units for $50 to $100 in the mid-1980s, while crack cocaine was sold in small "rocks" for $5 to $10 (Reinarman and Levine 2004).

Given the class and the racial components of people who use these drugs as Reinarman and Levine (2004) have noted, it was not surprising when urban poor communities became the target of aggressive law enforcement in the 1980s (Musto 1999). Clearly, the class/race status and dichotomy appear to connect quite well to the concepts of *urban inequality and social control perspectives* (Simes 2018) in explaining America's mass incarceration. But the important question on the disproportionate/racial composition of America's prison population seems unanswered. In other words, why should one racial group be the main "target" for mass incarceration despite the widespread use of illicit drugs among the general population?

As scholars have argued, racial disparity is not only the crux of US drug control dilemma, but race as a factor appears to shape federal and state drug laws and their enforcement strategies (Reinarman and Levine 2004). According to the National Association for the Advancement of Colored People (NAACP), African Americans and Whites use drugs at almost the same rates, but African Americans are six times more likely to be arrested and charged than Whites. Also, African Americans represent about 5% of illegal drug users, but account for 29% of people often arrested and 33% of those imprisoned for drug offenses (NAACP 2020). Reinarman and Levine (2004) captured the racial disparity dilemma with two examples worth reiterating at this point. To these scholars, America witnessed a surge in cocaine use by affluent Whites such as investment bankers, stockbrokers, Hollywood and rock stars, as well as professional athletes in the 1970s with many of them showing up in hospitals. Congress responded by passing laws to extend health insurance coverage to include drug treatment for them. However, when crack cocaine spread among African Americans and Latinos in the mid-1980s in poor urban communities, Congress passed new laws to extend the length of criminal sentences for crack offenses (Reinarman and Levine 2004).

This is where the federal narcotic laws that were passed in the escalation period of the war on drugs from the 1980s and onwards become important to underscore. For some, Nixon is credited with launching the war on drugs, but it was during the 1980s that the drug war actually escalated (Thoumi 2003). Like Reagan, President Bush also framed drug abuse as one of America's severe problems and demanded about $1.5 billion increase in domestic law enforcement for drug control and $3.5 billion for global efforts to reduce the supply of illegal drugs (Kumah-Abiwu 2019b) into the USA. Aided by the saliency of the drug issue in the 1980s, public support for stricter drug laws increased due to the sustained media campaign against drug use (Bertram et al. 1996; Kumah-Abiwu 2012).

For Travis et al. (2014), the 1980s throughout the 1990s represent the strictest era of drug laws that were passed by Congress and other state legislatures mandating lengthy prison sentences ranging from 5, 10, and 20 years or longer for drug and other criminal offenses. These stricter sentences continued into the 1990s with the "three strikes and you're out" laws which mandated minimum sentences of 25 years and longer for affected offenders. Some of these laws also required offenders to serve at least 85% of their prison sentences (Travis et al. 2014). The 1994 crime bill (Violent Crime Control and Law Enforcement Act of 1994), which was signed into law by President Bill Clinton also incentivized states with federal funding for building more prisons, increased prison sentences, and the reduction in early release of prisoners (Chung et al. 2019). For many, the 1994 crime law is one of the drug laws that has been responsible for the rapid increase in the disproportionate mass incarceration of African American males from the 1990s onwards (Chung et al. 2019).

Another aspect of the mass incarceration debate relates to the "connection" between drug use and criminal actions. Travis and colleagues argued that the changes in the prison sentences in most of the drug laws reflected a pervasive public perception that views incarceration as a tool for crime control. Yet, for four decades, America's incarceration rate increased with the crime rates showing no clear and consistent trends. The rate of violent crime, for example, rose, then fell, rose again, then declined sharply during the four decades of the drug issue (Travis et al. 2014). The likely explanation of mass incarceration, as Travis et al. (2014) have noted, might not necessarily be about the rise in crime, but the policy choices by legislators and political actors who favored aggressive law enforcement of drug laws in many urban areas for various reasons. On their part, Reinarman and Levine (2004) have suggested that America's mass incarceration seems to be the manifestation of the complex interplay and actions of politicians, the media, and the drug-control establishments to repress the urban underclass.

In fact, the urban underclass argument is a reminder of the *social control perspective* that highlights how racial minority groups in urban locations have not only been dislocated from the mainstream social and economic opportunities (Simes 2018), but efforts to socially control these urban communities are often based on their "perceived threats" to the social order. This might explain why Travis et al. (2014) have argued that social control through the war on drugs became the norm in urban/minority communities given the way most Americans view incarceration as an instrument for crime control. Smith and Hattery's (2008) reasoning on the above discussion might be useful to reiterate at this moment. In the words of Smith and Hattery (2008), mass incarceration appears to be a strategy to remove the so-called "un-useful members" of the capitalist society as reflected in the way ex-convicts are disenfranchised from the political process and reduced to a second-class citizens with weakened abilities to challenge the social and political power structures (Smith and Hattery 2008). Mauer's (2009) ideas on the social control argument are equally revealing. To Mauer (2009), law enforcement agencies have for decades focused their resources on curtailing narcotic drugs in low-income communities with the argument that drugs in urban neighborhoods are more likely to be disruptive to these communities. What this argument failed to recognize, as Mauer (2009) has maintained, is the fact that drug trafficking and use are common in White communities and can also be destructive to these communities.

Another dimension on the causes of mass incarceration deals with what could be described as the politics of issue framing (Kumah-Abiwu 2017) of the drug war, criminality issues, and the race factor. Legal scholar Scully (2002) got it right by arguing that the sustained onslaught on many African American communities through the war on drugs can be understood by examining how these communities have been historically framed and reframed through racial labels. From the era of slavery when the US Constitution does not even recognize the basic rights of Blacks as human beings, to the era of Jim Crow or segregated era laws with codes that criminalized the behavior of Black people, to the present era where "blackness" has been dehumanized and criminalized (Scully 2002). It could therefore be argued that racial disparities in mass imprisonment are the outcomes of negative perceptions/racial stereotypes and the racialized practices against African Americans at decision points such as police arrests, case handlings, and the imposition of prison sentences by judges (Travis et al. 2014). The media portrayal of African Americans, especially males as "offenders" and Whites as "victims" are a few cases in point (Travis et al. 2014). Clearly, the politics of framing the war on drugs and the violence nexus vis-à-vis the distortion of crime as Scully (2002) describes it was especially on display from the 1980s onwards. For example, there is no doubt that crack cocaine was widespread in many urban communities, but the way the media and political actors framed and repeatedly claimed that crack cocaine drove users to desperate acts of crime and violence show a clear case of the politics of issue framing (Reinarman and

Levine 2004). With the negative media portrayal of crack cocaine use as a dangerous "epidemic" that was connected to violence and criminal acts with the likelihood of its spread to affluent suburban communities (Reinarman and Levine 2004), it was not surprising when the law and order rhetoric and tough-on-crime mantra became the message for political operatives with the corresponding consequences for urban America.

## Consequences of Mass Incarceration

The 1990 report by the Sentencing Project raised public attention to the alarming trend in mass incarceration and the racial element of how one in four Black men between the ages of 20 and 29 were under some form of penal control in America (Roberts 2004). The collateral damage in terms of the consequences of mass incarceration in urban America is without doubt troubling. The list is long and out of scope for a lengthy discussion in this entry given the succinct requirement of the entry chapter. Nevertheless, an overview of the main consequences is discussed from two positions. First, the short-term consequences such as overcrowding and other health-related conditions linked with incarceration. And second, the long-term consequences such as the disruption of family structures and the political disenfranchisement of ex-felons.

With respect to the first position, Travis and colleagues noted that the increase in America's imprisonment from the 1970s resulted in the rapid overcrowding of many prisons. The speed and enormous size of the prison influx created further problems for states that were unable to build additional bed spaces to meet the rising demand. Large dormitory facilities and makeshift facilities were constructed to meet growing demands. It should be noted that the newly built facilities were different from the mid-1970s prison spaces where the average prisoner was housed in a single cell of about 60 squarefeet in dimension (Travis et al. 2014). On the health conditions of inmates, especially those from urban areas who are already faced with serious socioeconomic inequalities, Wildeman and Wang (2017) suggested that incarceration tends to offer short-term improvements in the health care of inmates due to the availability of medical care in the prison system. However, the post-incarceration period tends to always present profound harmful effects on the physical and mental health for most ex-felons and their families.

On the second position, Michelle Alexander's book titled *The New Jim Crow Law: Mass Incarceration in the Age of Colorblindness* captures the central debates on the consequences of mass incarceration on many African Americans and their political disenfranchisement. As revealed in the literature, Blacks were not only denied their humanity in slavery, but their aspirations for freedom and human dignity in the post-slavery era were short lived with the introduction of Jim Crow/segregated era laws which reduced African Americans into second-class citizens (Alexander 2012; Scully 2002). Drawing a strong parallel between the Jim Crow era of the 1950s and the consequences of the ongoing mass incarceration, it is clear, as Alexander (2012) has argued, that Americans, especially African Americans with "criminal records" are now living in a new Jim Crow era. To put it differently, America's racial history of slavery and Jim Crow era segregated laws have been transformed and replaced with another "racial caste" system of mass incarceration (Alexander 2012).

With strong cases in support of the central argument of her book, Alexander (2012) argues that ex-felons are being discriminated against in public housing, employment opportunities, the right to vote because of their status as ex-felons, and access to student loans for education. The long-term issue of educational inequity in these urban areas as Kumah-Abiwu (2020) has argued in his recent entry on educational inequity in America's urban communities is another important point to underscore. In essence, the mass incarceration of many African Americans as a result of the so-called war on drugs has created long-term consequences of racial injustice and

political disenfranchisement of fellow American citizens for nonviolent crimes (Alexander 2012). This practice of denying the right to vote to people with a criminal conviction, especially people from poor urban minority communities, is raising further questions about the growth of America's prison population and the transformation in the practice of citizenship and democratic rights in the USA (Travis et al. 2014). Unlike other Western democracies, the USA is the only major Western democracy that disenfranchises most of its prisoners and those who have completed their prison sentences (Travis et al. 2014; Manza and Uggen 2006). While efforts are being made to effect policy change, Chung et al. (2019) noted that about 6.1 million Americans have been prohibited from voting as of 2016. Simply put, as Alexander (2012) has reminded us, America's mass incarceration and its effects on many African Americans in urban communities are akin or similar to the Jim Crow era of the 1950s.

America's mass incarceration is also connected to recent sociopolitical events and modern social movements such as the Black Lives Matter (BLM) movement and their activism in raising public awareness on issues of racial injustice, mass incarceration of Blacks, and the criminal justice system. Rickford (2015) discussed similar issues on how BLM movement has become a modern practice of mass struggle with the movement representing the most recognizable expression of outrage by African Americans and many others against police aggression and racist violence. For Rickford (2015), as Escobar (2015) has also argued, BLM is not only addressing the reality that touches the lives of many in America's urban communities, but the movement is also increasing public awareness about structural racism and other issues such as the mass incarceration of Blacks in poor urban communities. It is expected that the relevance of contemporary social movements such as the BLM will not only continue to keep the discourse on criminal justice reform on the public agenda, but pathways can be created through policy ideas that will lead to genuine criminal justice reforms across the USA, especially at the state and local levels.

## Conclusion

The ongoing scholarly and public debates on why the prison population has increased more than 600% since the 1970s in the USA with two-thirds of the incarcerated people serving prison time for nonviolent drug offenses (Thorpe 2014) with enormous consequences of the mass incarceration on urban communities will continue to perplex the imagination of observers for some time. At the same time, the staggering fact that the USA with 5% of the world population has 25% of the total prison population of the world (De Giorgi 2015) might challenge the consciousness of the American people for policy change.

To understand the factors that have continued to shape America's mass incarceration and the consequences, this entry chapter has examined the discourse on mass incarceration in the context of the war of drugs. The entry integrated the concepts of *urban inequality perspective*, *social control perspective* (Simes 2018; Goffman 2014), and the *critical race theory* (Bell 1992) to advance the argument that the interplay of race, the war on drugs, and the politics of framing the law and order/tough-on-crime rhetoric have contributed largely to the increase in America's mass incarceration. It is clear, as the discussions in the entry chapter have revealed, that America's mass incarceration is creating a "second-class citizenship status" for many African Americans who have been disproportionately targeted in the so-called war on drug. Like other works of this nature, this entry does not condone criminal acts in anyway, but it is critical to also underscore the disturbing trends where poor urban minority communities are being besieged and unfairly and racially "targeted" in the war on drugs.

From the policy standpoint in terms of policy ideas and recommendations, this entry offers two specific recommendations. First, policy change through prison reform initiatives are urgently needed to address the imbalance in America's prison population. The ongoing policy initiative on prison reforms at the federal level is encouraging, but further reforms are needed at the state and

local levels. Second, there is the need to also rethink the drug control policy of the USA from the punitive law enforcement strategy toward a more public health approach to drug control policy.

## Synonyms

Agenda setting; Cultural imperialism; Globalization; Media ownership; Political theory; Status conferral

## Definitions

Mass Media: These refer to channels of information gathering and dissemination that perform a surveillance function on the government.

Political Theory: This refers to the political philosophy of any given government which enables such a political system to make and implement laws that check the activities of various institutions, particularly the media.

Media Laws: These explain the overt and covert laws made by the government in order to check the freedom enjoyed by the press. Such laws are primarily made to gag the press and make the media a pro-government machinery.

Governance: This is the exercise of political, economic, and administrative authority in the management of a nation's affair. It embraces all approaches – good and bad – that societies apply to distribute power and manage public resources and problems.

Imperialism: Imperialism refers to the subtle control that is facilitated by the media which a nation exercises over another nation as a result of its strong political and economic muscle, whereby such domination by a politically and economically vibrant nation causes the cultural erosion of the dominated country.

## Introduction

The interface between the media and the government is inextricable. The media is a strong institution that exerts a strong influence on the political institution. To this extent, the media is described as the Fourth Estate of the Realm. This implies that the media is an arm of the government just as the executive, the legislature, and the judiciary. Writing on "The Media as the Fourth Estate of the Realm: Real or Imagined," Ndolo (2011, p. 5) notes:

> . . .the press is a fourth branch of government that serves the public by acting as a watchdog, a kind of German shepherd whose glittering eye is eternally fixed on the Executive, Legislative and Judiciary to make certain that they do not abuse their power.

A one-time president of the United States of America – Thomas Jefferson – underscores the all-important need of the media in any government in 1787 when he asserted that he would choose a press without the government over government without the press. Writing from Paris to Edward Carrington whom President Jefferson sent on delegation to the Continental Congress

from 1786 to 1788, the President maintained that it is only the people that can censor public office holders and other managers of national resources. However, this kind of censorship can only apply in a society where freedom of speech and, consequently, press freedom are upheld (Ekwunife et al. 2021). The friction between the media and the government as an age-long thing could be traced to the authoritarian England when the state feared the all-powerful effect of the media under the assumption of the mass society theory (Okunna and Omenugha 2012; Udeze 2012). It was believed that the media had the power, the irresistible power to make its audience behave as advocated; hence, media criticisms against the government were feared and checked. The influence of the media on the ruling class could be pro-government or anti-government. In any case, every government seeks a press that will be pro-government; promoting and upholding its programs and activities to earn legitimacy before the people. Looking at the relationship between the media and government and how the government can influence the workings of the media, the political institution invariably determines to a large extent the modus operandi of the media by making laws which either provide an enabling environment for media operations or serve as a glitch to free press. In many situations, such overt and covert laws or measures of media control end up making the media a propaganda machinery, a sycophant, and a biased arbiter for the government. Therefore, the entry of this study seeks to examine how the media and government influence each other and also explain the implication of this to media practice, governance, and society.

## Origins

Following the establishment of a printing press in Abeokuta, Nigeria, in 1854, the advent of the first newspaper in Nigeria – *Iwe Irohin* – in 1859 was made possible (Okunna and Omenugha 2012; Omu 1978). *Iwe Irohin* was established by Rev. Henry Townsend, and the aim was "to get the people to read, since at this time, the Church Missionary Society (CMS) had trained about 3000 persons who could read and write and thus needed materials to read (NOUN 2017). While the press at this time was not primarily to attack the government, it is necessary to point out that the first paper in Nigeria – *Iwe Irohin* – made mordant remarks about slave trade in its contents and thus could be said to perform a surveillance function on the government. Many other newspapers followed, but mention must be made of the *Lagos Weekly Record* established by John Payne Jackson which was described as the first militant newspaper that was a thorn in the flesh of the colonial administration (NOUN 2017; Omu 1978), followed by the *West African Pilot* established by Nnamdi Azikiwe in 1937. These two newspapers were very nationalistic and vitriolic in content, leading to the ban of the *West African Pilot* for 6 weeks in 1945. The bullet effect of the media is evident that while some nations such as South Africa and Kenya got their independence in a pool of blood, Nigeria, through the press, got hers on a platter of gold through nationalists' writings. Worthy of note is the fact that earlier press was not profit driven. In fact, Dr. Nnamdi Azikiwe was the first person to turn newspaper business into a profit venture (NOUN 2017; Azikiwe 1971).

A look at the development of the broadcast media in Nigeria shows that radio arrived much earlier than television. The beginning of radio broadcasting in Nigeria could be traced to "December 19, 1932, when the BBC set up an experimental Radio-receiving station in Lagos to pick up the short wave transmissions of the empire service from Daventory" (Ndolo 2005, p.48). This was a radio rediffusion service meant to relay programs from the BBC in London. In the view of Okenwa (2011), it is "the monitoring and relaying (of) programmes from the BBC to her Majesty's servants in this part of the world." This shows that the introduction of radio in Nigeria was for political interest. The proper arrival of radio in Nigeria was in 1936 when the Radio Distribution service was centered in Lagos to distribute programs coming from the BBC in London (Okunna 1998). From here, the Nigeria Broadcasting Service (NBS) came up in 1951. In 1993, the Federal Government granted licenses

to private broadcasting in Nigeria which brought Ray Power Radio on the scene as the first private radio station in Nigeria, followed by Minaj Systems Radio in 1994. From here, the proliferation of radio followed. Television as part of broadcasting arrived nearly 30 decades after the radio in Nigeria. Notwithstanding, "Nigeria had the first television station on the African continent, and today it boasts the most extensive service" (Bourgault 1995, p.103). Western Nigeria Television was inaugurated in Ibadan in 1959 and then the Eastern Nigeria Television in 1960. In the year 1962, the Northern Nigeria found its own radio, thus establishing the TV station in the three regions of the country.

Several factors could be said to have aided the growth and development of the print and broadcast media in Nigeria. Some of them are technology (printing press), value system, minimal corruption, regulatory influences, competition, nationalism, absence of commercialization, tribalism and ethnicity, political parties, and so on.

It is necessary to explain that the struggle for nationalism and independence were factors that influenced the growth and development of the early media, particularly the print. In this struggle for nationalism which made the press criticize government programs and policies, the contributions of the *Lagos Weekly Record* and Nnamdi Azikiwe's *West African Pilot* remain most significant (Omu 1978). Next to this was tribalism. While the chain of papers called the ADVOCATE (established by Dr. Nnamdi Azikiwe) was seen to represent the interest of the Eastern region, Awolowo established the tribune to protect and project western ideologies. Gaskiya Tafi Kwabo was one of the papers to protect the Northern region. Establishment of newspapers and broadcast stations was a project so much propelled by political interest as the parties used such media for campaigns and interest representation. Each party saw the need to own and use the media. Hence, private broadcasting emerged after many years of government monopoly of broadcasting. The reason why the government held monopoly of the broadcast media for over four decades explains the friction between the government and the media.

## Media Ownership and Control in Nigeria

There are two major kinds of media ownership pattern in Nigeria. This could either be government or private ownership pattern. By government ownership, the medium – print or electronic – is owned by the government; hence, it belongs to the public. In Nigeria, every government, be it military or civilian, strives to have the state-owned media. This is primarily for political and economic reasons (Hilliard 2002). A government that is in control of the media can be sure of consolidating power. From the days of the authoritarian England, the government understood the importance of owning and controlling the media. Scholars (Okunna 1998; Siebert et al. 1973) observe that the authoritarian England set up media outfits that were staffed and controlled by the state because of the fear that the media could be used to adversely influence governance if left in the hands of private individuals. Authoritarian England therefore mapped out measures and strategies to control not just government but individually owned media.

Understanding the relationship between the media and the government, countries in the developing world have monopolized media ownership. Nigeria, for example, held the ownership of the broadcast media for 41 years until 1992 when President Ibrahim Badamosi Babangida deregulated the broadcast industry by Decree 38 of 1992 that allowed private ownership of the broadcast media. By this deregulation, individuals arrived on the scene of broadcast ownership with Ray Power Radio as the first in Nigeria, followed by the defunct Minaj Systems Radio, in Obosi, Anambra State (Okunna and Omenugha 2012). Today, there is a proliferation of radio and TV stations in Nigeria.

In Nigeria, media ownership could be overtly or covertly programmed. Overt ownership applies where the medium is directly owned and managed by the government or an individual, while covert ownership implies a stealthy and subtle ownership of a medium, which though is not openly expressed, but is expressed through control measures such as management structure and financing, among others. Government control measures are efficient ways of exercising control, and by

implication, ownership of both the public and private media. The ruling class has always found ways of bringing the media under its control. In Nigeria, such measures include heavy taxation, repressive and stringent legislations, pre- and post-censorship, (Ekwunife et al. 2021), assassination of media workers, direct and indirect control of essential production inputs, proscription of media houses, and licensing/patent system (Udeze 2012), among others. The squabbles that have existed between the government and the media in Nigeria are evidenced in many examples: the shutting down of many media outfits like the Daily Concord and Africa Independent Television; fining of Channels Television following its coverage of the ENDSARS protest in Nigeria; mal-handling of press men such as Minere Amakiri by the then governor of Rivers State, Diete-Spiff; the arrest and torture of Tunde Thompson and Nduka Irabor of the *Guardian* newspaper; the arrest and re-arrest of activist and former presidential aspirant Omoyele Sowore regardless of court order; the May 2019 arrest of Kaduna journalist Stephen Icefan and Bayelsa State publisher Jones Abiri; the August 2019 disappearance of activist and senior media influencer Abubakar "Idris Dariyata"; the detention of Agba Jalingo in August 2019; and the cases of journalists Joe Ogbodu and Prince Amour Udemud in 2019 in Delta State on the criminal defamation charges (Igwe 2020).

Still emphasizing the subtle means of media control in Nigeria, the media could be controlled through financing as who plays the piper dictates the tune. Government being a heavy advertiser could withdraw adverts in order to elicit media loyalty. This is not peculiar to the government. An individual could also withdraw advert which is a major source of media revenue. In all this, the aim could be to influence media content and strain editorial independence (Ekwunife et al. 2021). The bringing or withdrawal of adverts from a media house can either kill or sustain a media organization. The government can withdraw her financial assistance such as subventions (even in government-owned media) as a way of putting the media to financial pressures so as to compel them to conform to government policies and philosophies. This is a strong covert control measure that has yielded desired results for the government over time. The influence of financing in determining media content and overall management of the media could be seen in the operations of all state-owned media across the nation, turning such state-owned media into machineries that blow the trumpets for states. In an attempt to control the media, another way through which this is done is through the management structure. By this, the management composition of a media is arranged to reflect the interest of the proprietor or certain ideologies which could be political. When this is the case, news content is often slanted to suit some interest which could be private, group, or government.

In the broadcast industry, while ownership and control could be private or government owned, scholars (Udomisor 2013; Ukonu 2005) have argued that the National Broadcasting Commission (NBC), which is the body that regulates broadcasting, has devised approaches to pin down the privately owned media so that the interest of the government will be promoted and preserved. NBC itself, which is said to be a neutral body for the regulation of the broadcast industry, has so much been criticized following its composition and operations. For example, the chairman of the body is to be appointed by the minister of information who in turn is appointed by the president. Invariably, it is a recycling of the government in power which maintains the hegemony and resists every opposition party, ideologies, and philosophies. The high handedness of NBC as a repressive state apparatus against the private media is captured in the works of Udomisor (2013), Ukonu (2005), Nwachukwu (1998), and Onwumechili et al. (2011). Looking at the role of NBC, it could be argued that the allocation of frequency by NBC could be done on the basis of political exigency. This may leave the private stations on frequencies with poor network and limited reach. Sometimes, such wavelengths experience atmospheric jamming, causing a noise – an interference in the communication process. It should be noted that while stronger channels such as Very High Frequency (VHF) and Short Wave (SW) are exclusively assigned to the

federal government-owned stations, the weak ones in terms of coverage such as the Ultra High Frequency (UHF) and Frequency Modulation (FM) are allocated to state and privately owned stations. Such wavelength allocations could either strengthen or weaken media operations but will certainly put the government-owned stations at a vantage point.

## The Media and Authoritarianism

To examine the relationship between the media and politics, a review of the normative theories of the press will provide an insight. These classical theories are the authoritarian, soviet communist, libertarian, and social responsibility theories. The soviet communist theory does not encourage individual ownership of the media and sees the media as part of the government which must be used to advance governance. Only party members and loyalists were allowed to use the media. Libertarianism originated in the USA and advocates full freedom for the media. It is a free press where the media personnel are seen as rational beings who could decide what was right or wrong. The social responsibility theory believes that the media should exercise its duty with responsibility or have the government regulate her. From the classical period till now, these theories have provided the bases upon which the workings of the media have been carried out in different societies. A little more attention will be devoted to the authoritarianism which is the most pervasive of these earlier theories of the press – both historically and geographically (Siebert et al. 1973). Authoritarianism as a press theory originated from England in the sixteenth century and has been adopted by most countries as society and technology became developed to produce the mass media of communication. Siebert et al. (1973, p. 9) write: "It furnishes the basis for the press systems in many modern societies; even where it has been abandoned, it has continued to influence the practices of a number of governments which theoretically adhere to libertarian principles." For about two centuries, the authoritarian theory provided the framework for the relationship between the government and the media. Okunna (1998) and Udeze (2017) observe that the theory placed premium on the state as supreme; hence, reportage was expected to be pro-government. Negative criticisms against the government were strictly prohibited. Back to its formative stage in England, only the Queen who represented the state could decide what was right or wrong. Okunna and Omenugha (2012) highlighted that the Queen had sages or "wise men" who could decide what was right or wrong. Hence, individual opinions were not welcomed. While authoritarianism allowed individual ownership of the press, the mode of operation of those media was determined by the government, and the theory has been the mode of operation in many parts of the modern world more than any other theory. Tying points together, Siebert et al. (1973, p. 11) write:

> . . .the authoritarian's theory demanded a unity of intellectual activity since only through unity could the state operate successfully for the good of all. The idealist in the authoritarian camp postulated that this unity would come from the realization of the contribution of each to the society as a whole, while the realists recognized that such unity of thought could in most circumstances be attained only through constant surveillance and control

This explains the control which such authoritarian system has over all institutions, including the press. It is necessary to point out that the earlier western European societies operated on the authoritarian principle, hence the media system. Some of the basic assumptions were that:

- Man can only attain his full potential as a member of the society or a group, and not as an individual, and the state is the highest expression of group organization.
- Without the state, man remains a primitive being. He only achieves his ends through the state.
- Knowledge was discoverable through mental effort of the "wise men" who are capable of analyzing and synthesizing thought and information.

Some of the exponents of authoritarianism were Plato, Machiavelli, Thomas Hobbes, and Georg Hegel. Plato maintained that once the authority in a state is decentralized or equally distributed,

disintegration sets in. No publication was to threaten the position of the monarch for that would amount to threatening the stability of the state, and no censure should diminish the authority of the ruler. Consequently, the authoritarian principles sought to protect the state from media attack with many laws such as the law of sedition and libel. Till today, these are still very much prevalent.

## Mass Media and Cultural Imperialism

Among the relationships which the mass media has with other institutions, the link between mass media and cultural institutions is also noteworthy. Culture refers to the totality of a people's way of life that encompasses language, beliefs, religion, moral codes, arts, dress codes, and political beliefs, among others. Culture is both artifact (material culture) and mentefact (non-material culture/mental abstraction). While the mass media helps immensely to disseminate and preserve various cultures at a global level, it has been criticized heavily for being involved in the deliberate politics of causing cultural erosion, particularly the erosion of the cultures of the developing nations of the world. Okunna (1993) observes that the effect of the media in causing cultural erosion is evident in the eroding of Philippine culture as a result of the influx of American films and media contents into the recipient's country. This agrees with cultivation theory by George Gerbner which proposes that heavy viewing of television programs by the masses will create a homogeneous audience. This in turn influences audience perception of reality. Politically, agitations have evolved from the developing nations concerning the imbalance in global mass communication that ends up eroding the cultures of the developing countries. MacBride (1980) addresses this imbalance in the New World Information and Communication Order (NWICO) debate, noting that the imbalance in global mass communication is empirically proven. While the positive functions of the media in promoting cultural transmission are observable, global mass communication through the vehicles of the "Big Four" which are the world news agencies – Reuters, American Associated Press, United Press International, and Agence France Presse – has also shown gross unfairness in the global neighborhood that can sow seeds of unrest, frustration, and alienation in the impoverished people in the developing nations. Okunna (1998, p. 141) underscores the effect of the global media in cultural transmission when she writes: "...mass communication is a major carrier of culture, and that the mass media are cultural instruments which supply the cultural fare and shape the cultural experience of many millions of people in the modern world." With the use of satellite broadcasting, the entire world has been miniaturized into a global village where the new media technology helps to transmit cultures (particularly the cultures of the developed world due to media dependency) globally. This is invariably causing an erosion of the cultures of the countries that are technologically, economically, and politically less developed. This is a subtle and tactful imposition of western culture, particularly that of America (technically called Americanization in the field of mass communication) as the global culture. While the global media promotes the exchange of ideas at a global level (globalization), scholars have argued that this exchange further widens the gap between the north and the south.

This is cultural imperialism, a subtle politics of cultural dominion promoted by the media as a result of the huge political and economic dominance which the developed nations exert. Imperialism can be political, economic, or both. In any case, the dominant western culture imposes its values, ideas, views, beliefs, assumptions, and language, among others, upon a dependent third world culture through the process of global mass communication. The dominance of western culture is thus predicated on the control of media hardware or technology by the developed nations. This is an imperialistic relationship. In global mass communication, this dominance has been given different nomenclatures: cultural mainstreaming, cultural synchronization, cultural triangulation, and cultural homogenization (McQuail 2006; Bittner 1989; Okunna 1998).

## Mass Media, Agenda Setting, and Status Conferral

One strong relationship between the media and government is connected to the agenda setting function of the media and status conferral. By agenda setting, Sandman et al. (1976) write that while the media do not tell us what to think, they tell us what to think about. By implication, what the news media ignore is deemed not to be news, while any event which the media give attention to its coverage and reportage becomes news. Among the numerous happenings in the society, it is the ones that the media select, present, and discuss that the public knows about and discusses. What the news media – whether private or public – select for reportage can therefore be influenced by certain interest such as news commercialization, legislation, and regulation, among others. In the view of Onyeisi (2018), news commercialization has played a key role in altering the reality in news reportage and straining editorial independence. On this note, the mass media can be influenced to set political agenda for the society by deciding what political topic people talk about. The media set agenda for good governance by using its advocacy to ensure that governance is people oriented. However, media advocacies could be manipulated to suit certain individuals' or group's interest, ideologies, and other propensities.

In today's Nigeria, for example, popular agenda set by the media bothers on COVID-19, insecurity evidenced by terrorism, brutal killings by herdsmen, and commercialized abduction on a regular basis. In spite of these news reports, their frequency of presentation and framing could be politically subjective to influence audience' interpretation and perception. This explains why a particular event could have different versions of presentations and interpretations by different news outlets just to sway opinion. For example, while the Nigerian government was swift to mention the perpetrators of the Owerri prison invasion in less than 24 h of occurrence, those behind the Ishielu massacre in Ebonyi State are termed "unknown gunmen." Idike et al. (2019) explained such politics in line with inter-ethnic rivalry and national disunity which continue unabated because of governance issues associated with representative bureaucracy. The social media which is disposed to beating bureaucracy, gate-keeping, and checkpoints (Ekwunife et al. 2020a, b) has described this report as partisan. Observations have shown that news items that do not project the government in good light are often not carried by the mainstream media due to covert control. Therefore, the agenda setting function of the media can be a matter of political exigency.

By status conferral, the mass media confers status and legitimacy on political leaders and issues, thereby making them appear important and right. By constantly featuring a political aspirant in the media, an air of importance and credibility is created around him. This explains why political aspirants struggle for space and airtime in the media during electioneering. This is a strong link between the media and the political institution.

## Conclusion

The factors that determine the operations of the media in any given society are hydra-headed. All that are seen in the media as contents are products of the society as the mass media do not operate in isolation. The environment furnishes the media with materials for contents. To establish the inextricable relationship between the media and politics, both can be described as friends and enemies at the same time. The political institution cannot do without the press and vice versa. Common measures through which the media confers status on political figures include:

- Writing larger headlines that feature the favored candidate
- Placing the candidate at strategic positions where he is very visible in the print
- Showing the candidate's pictures/videos with other prominence-enhancing images
- Engaging in flattery articles about the candidate
- Featuring more of the candidate's quotes
- Featuring more lead stories on the candidate

# Maternal and Newborn Health Concerns in a Growing Urban Population

Aubrey Frantz
University of North Texas at Dallas, Dallas, TX, USA

## Synonyms

COVID-19; Digital health; eHealth; Maternal morbidity; Maternal mortality; Neonatal mortality; Pregnancy; Telehealth; Telemedicine; Women's health

## Introduction

The environment in which humans live and reproduce is evolving. The world is rapidly urbanizing and it is estimated that within the

next generation, nearly 70% of the world's population, approximately 7 billion people, will live in cities. Likewise, as the urban population grows and cities expand, the majority of pregnancies and births will take place in urban areas. The World Health Organization (WHO) defines maternal mortality as "the death of a woman while pregnant or within forty-two days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes." Accordingly, the World Health Organization's Global Health Observatory data estimates that 295,000 women die from maternal causes each year. Maternal mortality is an important indicator of societal health and is intimately related to neonatal mortality, the death of a newborn within the first 28 days of life. Like maternal health, newborn health is an important indicator of the overall health of a society. In 2018, 2.5 million newborns died within the first month of life, with maternal health complications attributing to an estimated 1.5 million of these newborn deaths. Neonatal mortality accounts for nearly 50% of all deaths under the age of 5. In addition to maternal and neonatal mortality, it is estimated that 15–25 million women suffer from maternal morbidity, any acute or chronic health complications due to pregnancy or childbirth. The yearly global economic burden of maternal morbidity is estimated to be $6.8 billion. As a result, maternal mortality is considered a public health crisis and improving maternal and newborn health should be a top priority for growing urban populations.

The purpose of this entry is to provide an overview of the emerging international challenges affecting maternal and newborn health in urban environments. Shifting maternal demographics, socioeconomic disparities, and the current COVID-19 pandemic are among contributing factors that increase the risk of maternal and newborn mortality. The role of digital health in addressing these urban maternal and newborn health challenges is discussed, along with barriers to telehealth access, coverage, and implementation.

## Causes of Maternal and Newborn Mortality

The main health complications that account for the majority of maternal deaths are well known. Hemorrhage (severe bleeding), hypertensive disorders (preeclampsia and eclampsia), and sepsis are the leading direct obstetric causes of maternal mortality and account for nearly 75% of maternal deaths (Say et al. 2014). However, health experts agree that more than 60% of these deaths are preventable, which equates to more than 177,000 preventable deaths a year.

Up to 90% of these maternal and newborn deaths are in developing countries, where the rates of urbanization are among the highest in the world. In many of these countries, urban population growth has outpaced the ability of the health services to expand and care for the growing population. However, this public health crisis is not limited to developing nations. The USA, where 82% of the population lives in cities or urban areas and where the urban population is projected to be between 87–90% by 2050, has the highest rate of maternal mortality in the developed world. Global increases in maternal age, widening income disparities, and the current COVID-19 pandemic are emergent urban concerns that challenge maternal and newborn health worldwide.

### Maternal Age

As cities expand and urban populations grow, urban maternal demographics are also changing. While global fertility rates have been steadily declining over the past generation, the average age of mothers at their first birth has been increasing. Likewise, over the past decade, the birthrate for women 35 years of age and older has increased, while the birthrate for women under 35 has decreased. More than 13% of births worldwide are mothers 35 years or older, which is significantly more than previous generations (Kassebaum et al. 2017). Maternal age is a strong risk factor for pregnancy-related complications and death, with a significantly higher risk of morbidity and mortality observed after the age of 30 (Blanc et al. 2013).

Although this demographic trend is observed in both rural and urban populations, it is particularly striking in metropolitan areas. Using data from the National Center for Health Statistics, a recent analysis of four decades of pregnancies and births has shown that the age of first-time mothers varies significantly with geography – with first-time mothers being older in large, densely populated cities (Bui and Miller 2018). In the USA, the average age of first-time mothers in rural communities is 24.5 years, while the average age of mothers in urban areas is 27.7 years. Even more striking, the average age of mothers giving birth for the first time in large metropolitan areas, such as San Francisco and New York City, is 32 and 31, respectively (Bui and Miller 2018). Similar shifts in urban maternal demographics have been recorded throughout the developed world. Greece, Australia, South Korea, Japan, Italy, Switzerland, and Luxemburg all have an average age of first time mothers over 30 years old (Livingston 2018).

Advanced maternal age, defined as 35 years of age and older at the time of pregnancy, is associated with increased risk of obstetric complications, preterm deliveries, infections, and postpartum hemorrhage (Blanc et al. 2013; Cleary-Goldman et al. 2005). Women over 35 are also more likely to delivery via cesarean section, as compared to younger women. While a cesarean delivery can be an essential life-saving surgery for a mother and newborn, studies have shown that cesarean deliveries are associated with an increased risk of all leading direct obstetric causes of maternal mortality, including hemorrhage, infection, preeclampsia and complicated recoveries. For women aged 35 and older, the risk for severe complication associated with cesarean deliveries is three times greater than women under 35. Furthermore, improper postpartum care can further exacerbate complications following surgery and, if not adequately treated, can lead to death. Notably, a large study looking at more than seven million live births across the USA from 2008–2009 to 2013–2014 found that the maternal mortality rate increased by 90% for women over 40, but did not significantly increase for women under 40 years of age (MacDorman et al. 2017). Equally concerning is the increased neonatal risks due to advanced maternal age – advanced maternal age is associated with an increased risk of preterm deliveries, low birth weight, neonatal admissions, and intrauterine deaths (Sandeep and Shanthi 2020).

### Income Disparities and the Urban Poor

Overall, maternal and newborn health in urban areas is considered better than rural areas and maternal and newborn mortality rates are generally lower in urban areas, as compared to surrounding rural communities. This urban–rural difference is largely explained by greater access to healthcare services in an urban environment (Vlahov et al. 2005). However, this generalization about an urban health advantage may be somewhat deceiving. Marginalized populations in urban areas and densely populated cities are often subject to additional barriers that restrict access to quality healthcare services, even when these resources are located nearby. Maternal and newborn health data from cities and metropolitan areas are often not segregated by socioeconomic factors. These factors undoubtedly affect the health of mothers, newborns, and families. Instead, the averages of the entire urban population are often compared to that of the rural counterpart. The studies that have attempted to categorize the urban maternal population into socioeconomic groups have found across-the-board that urban populations living in poverty (the urban poor) experience a greater degree of healthcare exclusion, as compared to the urban middle and upper classes. In fact, data from 30 developing countries across Africa, Asia, and Latin America indicate that the urban poor do not have better access to maternal health services than the rural population and rates of maternal and newborn mortality are significantly higher than the urban rich (Matthews et al. 2010). A UNICEF analysis of 56 mostly low- and middle-income countries, representing 28% of the global population, concluded that child mortality is 31% higher for urban poor children, as compared to urban rich children (UNICEF 2018). As for developed countries, the USA has the highest income inequality of all G7 nations and

has the highest maternal mortality rates in the developed world.

The prevalence of pregnant women with chronic conditions, such as hypertension, diabetes, and chronic heart disease, has also significantly increased over the past decade. These chronic conditions severely increase the risk of pregnancy and postpartum complications, including death. While the risk of developing these chronic conditions generally increases with age, particularly in women 30 and older, the greatest increases in the prevalence of these chronic conditions have been observed in low-income women of both developed and developing countries (Admon et al. 2017). Identifying and managing chronic conditions prior to pregnancy and during the prenatal period provide the best chance for a healthy pregnancy and delivery. However, low-income women are also significantly less likely to access the recommended pre-pregnancy and prenatal care. According to the Medicaid and CHIP Payment and Access Commission (MACPAC), from 2012–2014, less than 36% of uninsured women in the USA received the recommended prenatal care, as compared to 84% of privately insured women. Women with Medicaid were significantly less likely to begin prenatal treatment in the first trimester, as compared to women with private insurance. This lack of early prenatal quality care increases the risk of maternal morbidity and mortality four-fold (Advising Congress on Medicaid and CHIP policy 2018).

To compound this association between income and maternal health, fertility rates tend to be higher in low socioeconomic populations worldwide. As household income increases, the birth rate tends to decrease. These trends translate to more pregnancies and more births in urban areas. Consequently, these densely populated areas are becoming even more populated and more inequitable. In 2017, the birthrate in the USA was highest in families whose income was less than $10,000 US dollars per year, whereas the birthrate was lowest in families whose income was more than $200,000 per year (Duffin 2019).

The percentage of births that occur in a hospital or birthing facility, known as institutional births, is an accepted measure of healthcare coverage for both mothers and newborns. Increasing the institutional birthrate has been a prime strategy in many countries to reduce maternal and newborn mortality. Globally, WHO reports that 76% of births occur in a hospital or birthing center. However, when this data are analyzed based on socioeconomic class, the percentages are vastly different. In Cambodia and Nepal, for example, the urban rich have an institutional birthrate of over 80%, compared to an institutional birth rate of 20% for the urban poor (Matthews et al. 2010). In sub-Saharan Africa, one of the most rapidly urbanizing regions in the world and where maternal and newborn mortality are the highest, the institutional birthrates of the urban rich and urban poor are 85% and 36%, respectively (UNICEF 2018).

While an institutional birth is considered essential to ensure that the delivery environment is adequately prepared to handle medical complications, it does not necessarily ensure that the delivery is managed by a skilled birth attendant (SBA), such as a doctor, nurse, or midwife. WHO acknowledges that the presence of an SBA during delivery is essential to reducing the number of preventable maternal and newborn deaths. According to UNICEF data, 81% of births in 2019 were attended by a SBA. A WHO analysis of 45 of the world's most populated developing countries indicate that wealth is highly correlated with the presence of an SBA at the time of delivery – while SBA attendance is significantly higher in urban compared to rural areas, rural births and the urban poor births have relatively similar attendance, whereas the proportion of urban rich deliveries that are assisted by a skilled birth attendant is significantly higher (Houweling et al. 2007; UNICEF 2018).

## Impact of COVID-19 on Maternal and Newborn Health

The world is currently dealing with an unprecedented healthcare challenge. Over 100 million babies are estimated to be born during the first 9 months of the COVID-19 pandemic. The countries with the expected highest number of births not only coincide with the highest rates of urbanization worldwide, but are also among the

countries with some of the highest maternal and newborn mortality rates. These countries include India, China, Nigeria, Pakistan, and Indonesia. While initial data suggest that pregnant women do not have an increased risk of contracting the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2; coronavirus), and the risk of transmitting the virus to a fetus or infant is low, the Centers for Disease Control and Preventions (CDC) reported in June 2020 that pregnant women may be at an increased risk for severe COVID-19 illness (Ellington 2020). Nonetheless, the real impact of the COVID-19 pandemic on maternal and newborn health will likely be indirect. The COVID-19 pandemic has required healthcare systems worldwide to divert resources. Cities across the globe are reporting reduced hospital capacity, supply and equipment shortages, and a lack of skilled birth attendants due to these healthcare works being reassigned to care for COVID-19 patients (UNICEF 2020). Significant disruption in routine healthcare services, including maternal and newborn care, is consequently observed. In the USA, the country with the sixth highest expected number of births in 2020, more pregnant women are opting for home births due to fears of infection and companion restrictions in the hospitals (Schmidt 2020).

A recent study by Tim Roberton and colleagues estimates that the COVID-19 pandemic may increase maternal and child mortality rates by 38% and 45%, respectively. This novel study focused on 118 low- and middle-income countries, and identified a disruption of routine health services and reduced access to necessary resources as the major causes of these potential deaths (Roberton et al. 2020). While these mortality estimates are devastating, the predicted indirect adverse effects are not without precedent. Previous infectious disease outbreaks and epidemics have caused notable reductions in maternal healthcare coverage. The 2014 Ebola virus outbreak in Africa led to a 22% decrease in prenatal care visits, as well as decreases in institutional births and postnatal care visits (Jones et al. 2016). These reductions in maternal healthcare coverage resulted in approximately 3600 additional maternal and newborn deaths within 1 year of the outbreak (Sochas et al. 2017).

However, unlike the Ebola epidemic of 2014, maternal and child health in low-, middle- and high-income cities across the globe will likely suffer short-term and long-term consequences of the COVID-19 pandemic. As of May 2020, data from several states in India indicate that the number of institutional births have decreased nearly 40% during the pandemic (Kumar et al. 2020). Regional data from many of America's major cities suggests that access to maternal healthcare and reproductive services are being constrained. Marginalized urban communities are being disproportionately impacted by the drastic societal changes, such as unemployment, financial burdens, and lack of childcare due to COVID-19 lockdowns, which further hinders access to maternal healthcare services (Kotlar 2020). Moreover, in efforts to control and lessen the time women and newborns spend in the hospital environment, the number of scheduled labor inductions and cesarean sections being performed, particularly in metropolitan hospitals with a high COVID-19 burden, have increased during the pandemic. These nonmedically indicated (elective) deliveries, along with reducing postpartum hospital recovery time, are associated with an increased risk of maternal and newborn mortality and morbidity (Main et al. 2010).

In efforts to prevent additional maternal and newborn deaths in the coming months and years, UNICEF and WHO are urging governments and healthcare providers to enact strategies to ensure pregnant women receive uninterrupted perinatal care and to allocate additional resources and funding to maternal and child health services. However, it is likely that as funds continue to be funneled to support infectious disease care, maternal and newborn healthcare funding will also be negatively impacted for years to come. Many states have put temporary restrictions on reproductive healthcare services, such as abortions, labeling these services as elective or nonessential procedures (Bayefsky et al. 2020; Kotlar 2020). For women seeking an abortion during this time, it is likely that the legal gestational age will be surpassed by the time these restrictions are lifted. Consequently, pregnant women who are denied wanted abortions are significantly more likely to

suffer from pregnancy and postpartum complications, as well as maternal and newborn mortality (Gerdts et al. 2016).

## Strategies to Improve Urban Maternal and Newborn Health

Maternal and newborn mortality has been recognized as a public health crisis for several decades. In 2000, the United Nations Member States developed the Millennium Development Goals (MDGs), a set of eight goals to address global poverty; the fifth (MDG5) of which was to improve maternal health worldwide. Specifically, MDG5 set a target to reduce the 1990 global maternal mortality rate by 75% by 2015. While improvements in maternal health have been observed, the UN failed to reach their MDG5 goal. In 2015 the UN developed the Sustainable Development Goals, which established targets to reduce the global maternal mortality rate to less than 70 per 100,000 live births by 2030. Currently, the world is not on track to achieve this goal in the next decade.

Strategies to improve maternal and newborn health must address the changing urban environment as well as be able to respond and adapt to patients' needs, limitations, and preferences. Digital health involves the use of digital technologies to improve the health and well-being of individuals. While the term digital health encompasses many diverse technological innovations, telehealth, the provision of healthcare remotely by means of electronic information and telecommunication technologies, is an example that has proved to be successful in rural and underserved communities. Interestingly, in the USA, rural hospitals generally have more widespread telehealth capabilities than their urban counterparts (Puro and Feyereisen 2020). Accordingly, considering the barriers to quality maternal care and the additional challenges and risk factors described above, cultivating and expanding digital health resources and telehealth programs in cities and urban areas may be an effective strategy to improve maternal and newborn health.

### Telehealth

Although WHO recommends a minimum of eight prenatal care visits during pregnancy, only 64% of pregnant women worldwide receive four or more prenatal care visits (WHO 2018). Thus, for pregnant women who cannot financially afford, or otherwise have restricted access to, the eight or more routine prenatal office visits recommended by current guidelines, telehealth is a cost-effective solution to increase access to quality prenatal care and reduce in-office visits. Accordingly, quality prenatal telehealth programs should include, at minimum, scheduled virtual visits with a skilled health professional, at home monitoring of weight, blood pressure, and fetal heart rate, and 24-h access to on-call healthcare providers. Support for this flexible healthcare structure comes from large survey data of women who had recently given birth at urban academic institutions. These survey results indicate that the current prenatal and postpartum care guidelines are not aligned with patient preferences and that patients would prefer digital health, telehealth, and remote-monitoring options (Peahl et al. 2020). Furthermore, while telehealth can be useful, and even preferred, for routine prenatal care in low risk pregnancies, telehealth has also been shown to be instrumental in high-risk pregnancies. Telehealth has been used to effectively monitor and manage hypertension, chronic heart disease conditions, diabetes, pre- and postpartum bleeding, preterm labor, as well as placental and fetal abnormalities (Aziz et al. 2020; Whittington and Magann 2020). Overall, patient and provider satisfaction is high in both high- and low-income communities where maternal telehealth programs have been implemented.

Telehealth is also emerging as an important tool to manage healthcare during the COVID-19 pandemic. Telehealth is being used to not only triage and manage COVID-19 patients, but also to manage primary care and minimize the spread of the virus (CDC 2020; Fryer et al. 2020; Hollander and Carr 2020). UNICEF and WHO recommend that pregnant women follow the same social distancing guidelines as the general public and advise pregnant women to consider virtual and in-home prenatal check-ups, when

possible. Likewise, UNICEF is adamantly appealing to governments and healthcare providers to ensure that maternal and newborn care is not interrupted or compromised during this time. Encouraging the use and expansion of telehealth programs can alleviate the concerns of pregnant women who worry about prenatal and postpartum in-office visits, utilize physicians' time efficiently, and most importantly, maintain continuous quality maternal care.

Support for telehealth programs in the USA is aided by regulations such as the Medicare Telehealth Parity Act of 2015, which expanded coverage to Medicare beneficiaries in rural and urban areas. However, prior to March 2020, less than 1% of Medicare patients have ever used a telehealth service. Furthermore, regulations still exist that constrain the use of telehealth. Many states require patients to have a preexisting physician–patient relationship prior to remote conferencing, while other states require a telepresenter (a medical professional, such as a nurse, at the patient's site). Some states do not allow prescriptions to be prescribed online. Additionally, state-level medical licensing requires out-of-state providers to pay for medical licenses from each state that they practice from remotely. In efforts to reduce these barriers, nearly half of all states in the USA have pledged support for an Interstate Medical Licensure Compact (CDC 2019).

Additional barriers to establishing, expanding and sustaining telehealth programs exist in low income areas and developing nations, which often coincide with the most vulnerable maternal and newborn populations. The use of digital health apps and telehealth programs require access to reliable high-speed broadband internet and a mobile device. While most urban residents own a smartphone, this percentage is statistically lower for individuals with an income of less than 30,000 US dollars a year (Anderson and Kumar 2019). On the provider side, a technically challenged staff that may be resistant to change is the most cited barrier to telehealth adoption (Scott Kruse et al. 2018). The operation of telehealth programs require training and funding that developing countries and low-income communities may not be able to provide. Furthermore, there needs to be a shift in the functional approach to telehealth in these developing communities. In developed countries, telehealth is often used to supplement traditional healthcare; whereas telehealth in developing countries tends to be used as an alternative to an otherwise inadequate or inaccessible traditional healthcare model.

### Digital Health Resources

Along with continuous quality prenatal care and professionally assisted deliveries, WHO and CDC assert that patient education is essential to prevent maternal mortality and improve maternal and newborn health outcomes. Women must be aware of pregnancy and postpartum warning signs and symptoms, as well as understand how to properly manage any preexisting or chronic conditions that may complicate pregnancy or delivery. Numerous studies have concluded that women who are knowledgeable of pregnancy-related warning signs are significantly more likely to take appropriate healthcare seeking actions when necessary (Dangura 2020; Mwilike et al. 2018; Okour et al. 2012). WHO's focused antenatal care guidelines for all pregnant women include provision of information about the danger signs during pregnancy and instructions for self-blood pressure monitoring. Likewise, the Association of Women's Health Obstetricians and Neonatal Nurses cite that teaching women to recognize the post-birth warning signs of hemorrhage is one of the most important strategies to prevent maternal mortality and morbidity. This level of pregnancy education and awareness is particularly necessary for already marginalized women who lack access to continuous perinatal care, or encounter language or cultural barriers when communicating with their physician or healthcare providers. Digital health has the ability to offer an accessible and convenient means of obtaining comprehensible pregnancy and postpartum health information, without additional direct costs or in-person office visits.

Notably, pregnancy apps are currently one of the most widely used mobile health apps for smartphones. Common features of many of these apps include educational information, pregnancy resources, pregnancy tracking, and record keeping.

Similar to telehealth preferences, surveys from Australia, Korea, Germany, Ireland, New Zealand, South Asia, and the USA have all concluded that women overwhelmingly favor integration of pregnancy apps into their routine prenatal care. However, despite data that indicate that over 90% of women in their peak reproductive years (19–34 years of age) own a smartphone (Silver et al. 2019), there are lower levels of pregnancy app use for women in low socioeconomic groups. Technology literacy, health literacy, and language barriers are suspected to be causes for the reduced use of digital health resources, including pregnancy apps (Hughson et al. 2018). Likewise, as cities expand, the urban population tends to become more culturally and ethnically diverse and socioeconomic disparities can become even more pronounced. Considering the potential for these types of digital resources to improve maternal health, efforts should be directed to develop and redesign pregnancy apps that provide accurate, physician-backed information that is easy to understand for all literacy levels and caters to diverse maternal populations (Garnweidner-Holme et al. 2015).

While the popularity of pregnancy apps is soaring in developed regions, the potential positive impact on maternal health may be even greater in developing urban areas. Pew Research Center surveys conducted in 11 of the world's most populous developing and emerging countries in 2019 determined that 53% of adults in these areas own or have access to a smartphone. Moreover, smartphone use is significantly higher among younger adults in their reproductive years, as compared to adults 50 years or older (Silver et al. 2019). Accordingly, pregnancy apps offer an innovative and viable method to provide pregnancy education to women in developing urban areas, where healthcare systems have not yet been able to expand to accommodate the growing population. Several digital healthcare providers have taken the initiative to develop pregnancy apps that target and serve women in developing areas. Examples include MAMA in Bangladesh, India, Nigeria, and South Africa, Safe Pregnancy and Birth in Central and South America, GiftedMom in Cameroon and Nigeria, and JamboMama! in Tanzania. However, to significantly impact positive outcomes in maternal health, healthcare providers and governments alike must promote awareness, engagement, and expansion of these digital health tools to women and families in their communities.

Adaptations and innovations in maternal and newborn care are not limited to conventional healthcare systems or state and national healthcare policies. Community participation, mobilization and empowerment are recognized as important factors in improving health outcomes at the local level (Haldane et al. 2019). Successful community-based maternal and newborn healthcare programs depend on community-based healthcare workers (CHWs). The WHO states that CHWs should be selected by, trained, and work in the communities from which they are members. CHWs are not medical professionals, but rather have targeted training that allows them to carry out particular healthcare-related functions (Cometto et al. 2018). The home visits administered by CHWs, which may include basic antenatal and newborn care, diagnoses. and management of chronic conditions, as well as the distribution of essential medicine, have been associated with reduced maternal and newborn mortality in urban poor populations (Lassi et al. 2016; Nwameme et al. 2018). Equipping CHWs with digital health tools and resources tailored to their communities can assist CHWs in collecting patient health data, providing reminders and alerts, providing referrals and follow-ups, and offering training opportunities (Cometto et al. 2018; Schuttner et al. 2014). Furthermore, in addition to directly delivering healthcare services, CHWs can be effective facilitators of information and provide pregnancy and newborn care education (Lassi et al. 2019). Thus, while socioeconomic and cultural barriers exist that hinder access to continuous quality maternal and newborn care, CHWs can bridge the gap between the marginalized mother and the medical providers, and serve as knowledgeable advocates for their communities.

## Conclusion

The urban environment is evolving and maternal and newborn healthcare must adapt to protect

women, newborns, and families. In an ideal maternal healthcare system, all women would have access to comprehensive, continuous healthcare before, during, and after pregnancy. However, throughout the world, many women, particularly the urban poor, do not have access to this ideal, quality maternal care. Additionally, as cities expand and the size of the urban population grows, maternal demographics are also shifting, along with the risk factors associated with pregnancy and delivery. As previously mentioned, 60% of maternal deaths are considered preventable. Identifying risks early in pregnancy and managing these risks through accessible and continuous prenatal and postnatal care can aid in achieving the worldwide goal of ending preventable maternal mortality. Lastly, as the world is in the midst of the COVID-19 pandemic, pregnant women in densely populated cities are faced with additional barriers to quality maternal care. While the actual impact has yet to be determined, the pandemic will undoubtedly have short- and long-term effects on urban maternal and newborn health.

Established telehealth programs offer a relatively immediate strategy to improve maternal and newborn health in urban areas. While gaps in access and coverage do exist, telehealth in conjunction with digital health resources have the ability to provide continuous and cost-effective, quality perinatal care, as well as effectively monitor and manage chronic conditions and risk factors associated with an older and diverse urban maternal population. Importantly, telehealth also addresses the emergent concerns of women and healthcare providers by minimizing infections and efficiently utilizing resources.

While barriers to telehealth largely center on policy at the local and national levels, the international demand for telehealth programs has rapidly increased in response to the COVID-19 pandemic (Fisk et al. 2020; Hong et al. 2020). As a result, critical changes have been implemented across the globe to address the immediate need for telehealth. The Ministry of Health in Australia announced significant expansion of telehealth services, including allowing vulnerable general practitioners and healthcare professional to use telehealth for all primary care consultations. Many countries of the EU have loosened restrictions on online prescriptions and expanded reimbursement options for telehealth services. The Indian government has confirmed that it is legal to practice telehealth in India, as long as the practice complies with the recently released telehealth guidelines. In the USA, the Centers for Medicare and Medicaid (CMS), has removed geographical restrictions for patients and providers, as well as expanded reimbursement options for in-home telehealth visits. The US Department of Health and Human Services waived particular HIPPA (Health Insurance Portability and Accountability Act) regulations, which have generally limited providers from delivering remote or mobile care. Furthermore, the Coronavirus Aid, Relief, and Economic Security Act (CARES Act) pledges millions of dollars in additional funding to help expand current telehealth programs.

As healthcare systems worldwide establish and expand telehealth programs and digital health resources in response to the global health crisis, decisions and investments will need to be made to sustain these programs and resources for long-term use. While these decisions may come with trade-offs, WHO asserts that "maternal, antenatal and newborn health matters to every person, society and country, and should be viewed from both a human rights and wellbeing perspective as highly important topics." The world's population is now predominantly urban and several billion pregnancies and births will take place in the urban environment within the next generation. Recognizing and addressing urban maternal and newborn health concerns is vital to preventing maternal and newborn mortality and improving the health of all people.

# Max Weber and Organizational Theory

David K. Brown
Illinois State University, Normal, IL, USA

## Synonyms

Bureaucratic theory; Rationalization theory

## Definition

Legitimate authority: rule with the consent of the ruled based on cultural beliefs that justify social hierarchies.
Charismatic leadership: a highly personal type of rule where a following obeys an individual due to belief in that person's unique, gifted qualities.
Traditionalism: a system of rule where subordinates obey the demands of a group of superiors because they are natural inheritors of such authority.
Legal rationalism: a modern form of rule embedded in impersonal, written rules of conduct and subordination to offices held by persons who claim technical expertise required to perform specific tasks.

## Introduction

Max Weber (1864–1920) was a German social theorist who was instrumental in the establishment of the discipline of sociology and much of its subsequent development. His circle of colleagues and students included luminaries of the era such as Georg Simmel, Robert Michels, Werner Sombart, George Jellinek, Edgar Jaffe, Ernst Troeltsch, and Heinrich Rickert (Mommsen and Osterhammel 2010). Weber made widespread contributions to economic and political sociology, as well as the study of kinship, religion and culture, law, race/ethnicity, education, and the methodology of social science. Works titled *Economy and Society* (1922) and *General Economic History* (1919b–1920) suggest the scope of his analyses. Weber's sociology was informed by a keen analysis of power structures and a deep historical sense about organizations. His work can be viewed as an effort to understand the defining features of modernity in the West, particularly the highly rational and transformative character of modern forms of social organization, thought, and action which he contrasted with prior historical forms. Weber's organizational theory was a perspective that he applied to economic institutions, businesses, nations, political parties, cities, families, schools, religious groups, and voluntary organizations. In each case, he engaged in comparative-historical studies that sought to show the causal development of modern modes of social organization.

M

## Concept Formation in Weber's Organizational Sociology: Ideal Types and *Verstehen*

Much confusion about Weber's perspective has resulted from failure to understand the methodological context of his writing. Weber, like many others, was embroiled in the great *Methodenstreit* (methodological controversy) of the early twentieth century which concerned the goals and character of disciplines that studied human history. One side advocated a humanities orientation that would create aesthetic/empathetic knowledge, while the other side sought social sciences that would parallel the causal-explanatory framework of natural sciences. Weber was decidedly on the latter side of the debate, but sought some degree of compromise with his notion of *verstehen* (interpretive understanding of actors' cultural dispositions toward types of social action *as a component* of causal explanation). Weber's *The Protestant Ethic and the Spirit of Capitalism* (1904a–1905), for example, famously argued

that religious motives played a pivotal role in the emergence of rationalized capitalism, alongside a plethora of structural causes.

The cornerstones of Weber's analyses of historical social change were his "ideal type" concepts. These were neo-Kantian constructs that he adapted from Heinrich Rickert's epistemology (Burger 1976). Ideal types were conceptually "pure" abstractions drawn from a broad set of concrete historical cases (Weber 1904b–1919, 89–110). An ideal type of organizational structure such as bureaucracy thus was a depiction of what a fully bureaucratic organization would look like. There could be many contrasting ideal types as well as subtypes arranged along continua. Empirical cases always displayed elements of several such conceptual frames of reference.

An important consequence of this method is that one cannot logically "disprove" an ideal type with empirical cases that fail to measure up fully to the specifications of the pure type – such variance is fully expected. A good deal of administrative science following Weber misunderstood the purpose of ideal-type concepts and sought to "prove Weber wrong" merely by noting non-bureaucratic elements in modern bureaucratic organizations. Weber's point was that different places and historical eras were marked by social constellations that were markedly tilted in the direction of one or another form of organization.

## Three Connotations of "Rationality"

As both Kalberg (1980) and Schluchter (1981) have persuasively argued, the centrality of the concept of "rationality" in Weber's work takes on several associated meanings. One sense of rationality is tied to his theory of social action and cultural motivation where he distinguishes:

(a) Affectual action driven by emotional attachments
(b) Traditional action embedded in habituation
(c) Value-rational action tied to belief in the ultimate validity of religious and other cultural ideals irrespective of outcomes
(d) A peculiarly modern form of instrumentally-rational action that is determined by the technical efficiency of given means to achieve rationally determined ends (Weber 1922, 24–26)

Another sense of rationality is connected to Weber's (1922, 215–54; 956–1157) analysis of historical organizational power structures. In this context, he employs a three-part typology of charismatic, traditional, and legal-rational forms of "legitimate authority" and subtypes within each that will be discussed below. In contrast to simple "domination" which Weber (1922, 212) defines as "the probability that certain specific commands (or all commands) will be obeyed by a given group of persons" for reasons ranging from interests in survival to material rewards accruing from compliance, legitimate authority implies additionally *cultural beliefs* of subordinates that justify their obedience. This circumstance produces distinctive administrative outcomes. Social action types are tied to these types of legitimate authority.

Finally, Weber speaks at times of rationality as a broad force that actively seeks to transform social life in accordance with impersonal principles of predictability and calculability that are reinforced by legalistic written rules and professional expert administrators and arbiters, i.e., the "rationalization" of society.

## Charismatic Authority and Its Transformations

Charismatic authority is a primordial form with modern remnants. It is a simple administrative structure composed of a charismatic leader and a group of followers. Mommsen (1974) argued that it is better characterized as "leadership" than "authority" for this reason. Among the various types of legitimate authority, the charismatic form is the most "personalized" type, with power literally vested in an individual. Religious prophets and other revolutionary leaders, such as Jesus Christ and Fidel Castro, in the earliest phases of nonformalized leader/following structures are

prime examples. Possession of charisma comes from utterly noninstitutionalized mechanisms—it inheres in the person and cannot be acquired by others through formal training, hereditary transmission, or other vehicles.

The basis for legitimacy in charismatic authority is a belief among followers in the extraordinary and unique "giftedness" of the leader in various capacities that justifies compliance with administrative mandates (in the form of revelations) as a matter of "duty" that is irrespective of economic and rational considerations. Its irrational, unpredictable, affective/emotive basis of decision-making and other actions is diametrically opposed to rational-legal principles of authority. Charismatic leaders have had revolutionary capabilities in uprooting especially traditional forms of authority. Weber (1922, 1114) notes that charismatic authority suffers from an inherent instability that derives from the necessity of leaders to provide ongoing "proofs" of their unique abilities to rule:

"The charismatic hero derives his authority not from an established order and enactments, as if it were an official competence, and not from custom or feudal fealty, as under patrimonialism. He gains and retains it solely by proving his powers in practice. . .by bringing well-being to his faithful followers; if they do not fare well, he obviously is not the god-sent master."

This situation is complicated further by the limited administrative scope of an individual leader and by the absence of rules of succession to compensate for the leader's mortality.

Weber (1922, 1121–48) refers to the transformation of charismatic authority to legal-rational and traditional forms as the "routinization" of charisma. Passing of individual charisma to formalized channels of acquisition such as kinship lineages, ethnic and racial group memberships, offices, kingship, plutocracy (bought memberships), and schooling are examples of this process that takes purely personal authority to more complex, group-level administrative forms. This facet of charismatic authority has been useful for understanding the trajectories of upstart religious and political movements that challenge traditional and legal-rational governance structures.

## Varieties of Traditionalism

Weber's concept of traditional authority included several variants that were pervasive in world history. Everything was centered on rule within "household" economic and political structures. It was typically a male-dominated system legitimated by cultural beliefs in historically immutable hereditary rights of a *group*, rather than an individual charismatic leader. Weber (1922, 215–17) describes this belief as:

> [R]esting on an established belief in the sanctity of immemorial traditions and the legitimacy of those exercising authority under them. . .based on personal loyalty which results from a common upbringing. . .The person exercising authority is not a 'superior,' but a personal master, his administrative staff does not consist mainly of officials but of personal retainers, and the ruled are not 'members' of an association but are either his traditional 'comrades' or his 'subjects.'

Patriarchy was the simplest and most personalized form, with a single male authority claiming hereditary rights to power. Gerontocracies extended this power to a group of elders. Patrimonialism created the beginning of a still relatively powerless administrative staff of extended kin group members who implemented masters' orders in relation to subjects. The feudal estate was a more complex structural precursor to modern bureaucracies, where a staff of military, judicial, and other officials assumed varying degrees of discretionary power and social status (i.e., privileges of an "estate").

Traditionalism, even in its most advanced administrative forms, always was a fetter on the development of expansive, formally rationalized economic, and political institutions because of its mooring in arbitrary personal authority and the complacency of time-honored practices. In Weber's (1922, 237–41) view, the absence of impersonal, universal, and consistent legal codes of conduct that promote stability and calculability limited capitalist developments under such regimes to trading, tax farming, state supplications, and colonialism.

As Shils (1981) discussed, this form persists in many realms of contemporary societies. Meyer and Rowan (1977) and Dimaggio and Powell

(1983) provided classic analyses of formal rationality in organizations *as traditions* of institutionalized mythic/ritualistic practices and mimicry of other organizations.

## Legal-Rational Authority

The third type of legitimate authority is the legal-rational form manifested in bureaucracies as late historical developments. As Bendix (1978) elaborated along Weberian lines, a precondition for its emergence was the uprooting of traditional authority in all its forms by democratic political movements and accompanying citizenship rights. This form of organization had its origins in modern political/legal structures and in the Western rational capitalist economy. Weber saw this mode of organization and authority as a highly transformative force that was spreading to all institutional arenas as the definitive mark of modern civilization. Compared to other historical forms of organization, the legal-rational bureaucracy was a very stable arrangement that would be difficult to supplant in any significant measure. A belief in the legitimacy of impersonal, democratically enacted, formal rules of administration as technically efficient means to achieve collective goals replaces prior bases of authority. Predictability, consistency, stability, calculability, technical competencies, and clearly delineated impersonal authority are hallmarks of this type of organization.

Weber's (1922, 217–225; 956–1005) lengthy depiction of an ideal-typical legal-rational bureaucracy in its fullest, always empirically unrealized form contains the following key elements:

1. Consistent performance of administrative functions in a manner that is governed by written rules of conduct that are preserved and accessible to appropriate parties.
2. Clearly specified areas of substantive jurisdiction, together with the requisite authority to carry out duties within a technically defined division of labor.
3. Hierarchical organization of appointed (not elected) offices with rights of appeal and grievance from lower to higher offices. Offices serve as primary, full-time, career occupations of incumbents and are not appropriated by their holders; they are subject to rules of appropriate conduct and dismissal.
4. Specialized technical training qualifies individuals for offices. In the strongest cases, this competence is credentialed through formal examinations and/or educational degrees.
5. Officials are non-owners of the productive and administrative apparatuses of the organization.

Classic studies of governmental and industrial bureaucracies by Selznick (1949) and Gouldner (1964) demonstrated that these features of modern organizations may be present or absent to greater or lesser extents in concrete cases and may be found in combination with elements of charismatic and traditional organizational structures where such cases deviate from the ideal type.

Weber (1922, 973) argued that bureaucracy was "technically superior" to other prior forms of administration in terms of "precision, speed, unambiguity, knowledge of the files, continuity, discretion, unity, strict subordination, [and] reduction of friction and of material and personal costs." Stinchcombe (2001) clarified that formality indeed works best *where these traits are needed to perform particular tasks*, i.e., in complex, geographically and functionally far-flung enterprises, such as running large business enterprises or universities where personal rule is an inefficient device.

The structural framework of legal rationalism would be of little consequence if it were not accompanied by corresponding cultural predispositions and propensities to particular courses of action. Weber discusses at the social action level pervasive "instrumentally rational" conduct that is guided by beliefs in achieving organizational goals through the most technically efficacious means and the belief that the hierarchy of authority and technical competence of office incumbents is the legitimate way to do these things. The secular "spirit" of capitalism that Weber (1904a–1905) depicted as ironically emerging from believers' calculations of their religious salvation prospects is precisely this "culture" of legal rationality or what later analysts would come to call a "bureaucratic ethos." Elias (1939) traced

this trend as a form of internal "discipline" in the modern age.

This juggernaut of structural, cultural, and social action forces had few limits in terms of spheres of influence. Weber's (1911) analysis of the evolution of the uniquely rational character of Western music is a fascinating extension of his theory, as are his studies of the growth of legal rationalism in law, education, religion, and cities, to name a few. Later elaborations of Weber's ideas about rationalization include Merton's (1938) classic study of the development of systematic scientific and technological pursuits, "critical theorists" such as Habermas (1981) who depicted rational colonization of the "life world" of modern societies and Ritzer's (2000) popular account of the "McDonaldization" of society in accord with the routines of the fast-food chain.

## Conclusion

Weber (1904a–1905, 182) had trepidations about the entrenchment of legal-rational authority as an "iron cage" that governed various spheres of society:

"No one knows who will live in this cage in the future, or whether at the end of this tremendous development entirely new prophets will arise, or there will be a great rebirth of old ideas and ideals, or, if neither, mechanized petrification, embellished with a sort of convulsive self-importance. For of the last state of this cultural development, it might well be truly said: 'Specialists without spirit, sensualists without heart; this nullity imagines that it has attained a level of civilization never achieved.'"

Democracy movements and citizenship rights had ended the powers of traditional authorities in many areas, but bureaucracy substituted for them the nominally "impersonal" rule of professional experts in widespread contexts which remained a source of contentious power struggle. Tensions between democracy and bureaucracy produced recurring popular calls for a return to charismatic and traditional forms of rule. Technical efficiency principles "disenchanted" the world of human creativity, passion, and leadership that Weber saw as essential to social and political life. Weber knew that we were relegated to bureaucratic institutions for the foreseeable future, but he nevertheless argued in his famous "Politics as a Vocation" speech for an infusion of a restorative charismatic element of passion to modern organizational life Weber (1919a).

Weber's legacy in organizational studies is immense, with continuing relevance in the twenty-first century. There is an ongoing genre of "Weberian Studies" that attests to this fact (Scaff 2014). As more of Weber's unpublished and untranslated writings become accessible, an even fuller recognition of his already daunting contributions will become possible.

## Synonyms

Comparative public administration performance analysis; Performance indicators; Performance measures; Tools for analyzing police performance and risks

## Introduction

Measures for police performance, i.e., performance measurement (PM) tools for police work, are analyzed in this entry. This entry suggests practical performance measures for analyzing police work quality, cost-effectiveness, and risks and is based on a comparative case study using both qualitative and quantitative data from Spain and Finland. Performance measurement (PM) within the public administration has grown in both number and importance, even if measuring, for example, police performance is not easy because of the intangible nature of safety and some other outputs (see Lapsley 2009; Rautiainen et al. 2017). Performance measures (or indicators) are currently an integral part of police work, focusing on the quantifiable elements of performance, such as services or operations performed or on the public perceptions on police (Rautiainen et al. 2017). However, there are differences between countries in the ways of public service production, and thus the applicable key performance indicators (KPIs) may also differ. The service field and country-specific differences offer an interesting field for comparative public administration (CPA; see Jreisat 2018) analysis.

In official police reporting, there are typically relatively few KPIs about police work quality and risks, even if police work may be different in different countries and regions (Rautiainen et al. 2017). Exact all-round indicators of police performance are difficult to find because in different contexts and circumstances also different performance management is needed. Therefore, comparative case research into KPI development and risk issues at different analysis levels (local police, national police, and society) may reveal new insights for improving police work management. Generally, police functions include defending public security and maintaining order and law compliance. Yet there are several focus areas of police service provision. It is not clear how performance in these areas (e.g., in citizen security or traffic security) can be measured and what KPIs are emphasized in police work. Further, the measures needed and the perceived value created for the public may differ depending on the focus of operations, such as number of arrests, etc., or achieving of social impact (Davies 2017; Trochmann and Gover 2016).

This entry analyzes the risks and applicable PM indicators of police work, comparing Finland

and Spain, targeting to develop value-added risk and quality balanced measures for managing police work performance, taking into account the country-specific differences. This entry therefore analyzes the similarities and differences among police PM in Finland (a Northern European country with about five million inhabitants only) and in Spain (a Southern European country with 46 million inhabitants). The comparison of police work in two European countries with different sizes and traditions allowed us to understand the complexity of police performance management and to further develop and design new performance indicators to measure police work quality and risks in a balanced way.

There is much research on performance indicator design in the public sector. Typically the research has emphasized key performance indicators (KPI) in balancing financial and operative perspectives of public sector operations (Batac and Carassus 2009; Muñoz et al. 2006). There is also a lot of accounting and PM research into health services, but the risks in public sector operations have received relatively little attention (Lapsley 2009). Further, several political and other stakeholders present in the public sector may affect managerial decision-making and complicate the use of KPIs. Therefore, police work stakeholders may benefit from assessing performance in a balanced way, i.e., taking into account multiple performance aspects, such as risks, cost-effectiveness, and the citizens' perception of the quality of service.

There are a few accounting studies on police services and police PM (e.g., Carmona and Grönlund 2003; Collier 2006; Rautiainen et al. 2017). These studies have noted the complexity of police work PM and the difficulty of creating KPIs that foster cost-effectiveness. Further, there is literature on police strategic and risk management, where it has been noted that the risks of police work relate, for example, to community unrest, use of force (Davies 2017; Trochmann and Gover 2016), or perceived stress (Hart et al. 1993). Stress and community unrest may also be visible at the organizational level financially because of, for example, absences or in overtime pay (De la Fuente et al. 2013; Niemi 2012; Vuorensyrjä 2012). In risk management-focused police research, the focus often tends to be either on financial or personal aspects (e.g., Kohan and Mazmanian 2003), though these are not necessarily disconnected issues, and there may also be political risks related to financial budget negotiations (Rautiainen et al. 2017). The diversity of police work complicates the design of balanced indicators so that overall cost-effectiveness and the risks of services are difficult to measure (Diez-Ticio and Mancebon 2002). Thus, there is a need for analysis of KPIs, risk management, and managerial decision-making in security services among European countries with differing sizes and cultural backgrounds (see Carmona and Grönlund 2003; Collier 2006). Here an aim is to combine aspects of PM, quality, and risk management by creating comparable police cost-effectiveness indicators for police managers and for future PM research. In order to understand the differences and similarities in the police work, a comparative approach is used, i.e., police organizations from differing European countries with potential differences in operating culture and risk management are observed. The research questions (RQs) are as follows:

*RQ1: What KPIs on quality and risks of Police work are used in Spain and in Finland?*

*RQ2: What kind of complementary indicators might be developed based on existing PM and risk data?*

In case studies the use of both numerical and qualitative data (mixed data) may be useful, although often qualitative interpretive case research tradition is mainly followed. This means looking for meanings in the case events and data in order to understand how performance indicators might be used in a more motivating way, redesigned or new measures constructed (Kasanen et al. 1993). The research questions will be answered based on analysis of police work KPIs in Finland and in Spain available on the Internet, using archival data and published reports, and data from interviews and discussions with police managers and other personnel. Further, additional qualitative data was gathered in 2013 with 11 recorded follow-up interviews with police officers in both Spain and Finland

(Appendix 1). These interviews provide a perspective on the trends of police work.

Contributions to public sector PM literature are sought for by comparing police PM in two European countries with quality, efficiency, and risk measurement focus (Lapsley 2009; Kohan and Mazmanian 2003). This increases accounting knowledge of risk-based indicators suitable for police work performance measurement. Next, the Spanish and Finnish cases are introduced, including analysis of the disclosure, usefulness, and comparability of KPIs. Finally, new measures for risk-based performance both in terms of financial and professional risks may facilitate balanced police work performance measurement, including quality, cost-effectiveness, and risk issues.

## Spanish Case Study

The aims of the Spanish police are to protect citizens, to foster compliance with the law, and to control the traffic in the country. The Spanish police comprise three institutions: the national police, the Guardia Civil, and the local police. The national police and the Guardia Civil are positioned under the Ministry of Interior, while the local police depend on the local councils. In Spain, there are 52 provinces and 8116 municipalities. The Spanish police defends the security of 46.7 million inhabitants, 10% of whom are immigrants, and has over 60.6 million tourists annually.

Spanish police work is divided into several areas as coordination, traffic, citizen security and harmony, and administrative and judicial areas. These functions are divided among the three police bodies. For example, the local police and the Guardia Civil have their traffic control competences divided into urban or rural areas. Further, the national police and the Guardia Civil are more focused on counter-terrorism, cybercrime, and environmental crimes, while the local police are more focused on citizen security, domestic violence, and traffic offenses. Currently the three bodies prioritize the measurement of the risks, quality, and cost-effectiveness of the services offered to the citizens. Data about each police institution are published on the Internet including its aims, services, KPIs, and other statistics. The currently published indicators do not provide much information about quality, risks, or cost-effectiveness. The statistical information disclosed by each police institution may have some differences of focus, but the general KPI categories are relatively similar (see Appendix 2). The researchers were involved in the development of police performance reporting practices and the comparability of the KPIs among Spanish regions in a longitudinal municipality project during 4 years.

In order to examine the qualitative aspects of the research, data from five follow-up interviews in the Central Spain Police District (Appendix 1) are also used. Regarding the use of KPIs in decision-making, some of the interviewees informed us about a cultural change toward measuring results, instead of inputs, as Appendix 2 shows.

> Our main focus is on the citizen perception and satisfaction; therefore, the most important indicators are outcome indicators such as the amount of crime offences solved or the delinquency rate. (Interviewee 1)

Absence from work is measured also because high police visibility is seen as preventive activity, even though it is difficult to measure. From the economic point of view, the police are trying to maximize results with the minimum of resources. Gradually cost consciousness is spreading, even though some police officers still consider operative decisions to be separate from finances. These opposite views may, however, frustrate police officers and reduce their job satisfaction.

> For some years now rationalization of the services has spread: cost is prioritized when before it never was. Cost indicators were not relevant when we had to make interventions. (Interviewee 2)

> When the police have to act against crime . . . they will not look at the cost of the activity, but reductions in the budget are currently made by reducing investments drastically, so that we have no more new vehicles, offices etc. (Interviewee 3)

> Police must achieve the maximum cost efficiency in parallel with citizen satisfaction. (Interviewee 1)

Regarding risk and quality analysis, interviewees 1 and 4 saw the development of new crime types and the cutting of resources as risks in police work.

> The biggest threat currently to achieving good quality police work, from the operational point of view, is the use of new technologies by delinquents (cybercrime) and by international terrorists. From the financial point of view the budget is decreasing and there are fewer human resources, and from the administrative point of view there is the increase in regulations to comply with and the number of reports to fill in before any intervention. (Interviewee 1)

Some qualitative (e.g., political or personal) PM aspects on individual level risks, such as stress, health issues, or experiencing physical harm (e.g., by certain demographic groups), can be considered confidential or difficult to measure. This decreases the amount of such KPI information being disclosed, so the risks to different local police organizations cannot be properly compared, with the consequence that local area performance cannot yet be judged based on risk and quality data. Increased disclosure of information might facilitate the development of more comparable indicators of performance.

## Finnish Case Study

In Finland, there are only 5.35 million inhabitants in total and far fewer immigrants than in Spain. The Finnish police are organized as a national unit under the Ministry of the Interior. There are central national sub-units, for example, for financial crimes and for national security, and then there are 11 local police areas. The local police areas are not organized under local government organizations but belong to the one national Finnish police. Finnish police performance statistics are gathered routinely and systematically in a Crime Reporting System by the local police areas. Further, the Emergency Response Center (where citizens call for emergency help) keeps statistics on the response times and the number of emergency calls. Lately attention has been paid to the accuracy of statistics, because statistics on costs and effects are an essential part of the funding negotiations with the Ministry of the Interior. Further, when scarce resources have to be faced, the response times are prioritized: crime investigation times do not always need to be fast, but response times need to be. The most important performance information (see Appendix 3) is given to the media and is publicly disclosed on the Internet, mostly at the national (aggregate) level.

Some police work KPIs may need to be analyzed together. For example, if the overall funding of the police increases but the number of crimes investigated remains relatively similar, poor cost-effectiveness might be indicated. But an increase in the percentage of severe crimes or drug crimes being solved might give a more in-depth view of the situation. Because the effects of different types of crimes are not known, the long-term cost-effectiveness of police work cannot really stated, but simple indicators potentially representing police work cost-effectiveness can be constructed.

In the sparsely populated areas of Finland, there are automatic traffic surveillance cameras, which are cheaper than police patrols. However, this also indicates a choice toward preventive controlling and assigning the scarce resources to more strategic crime fighting duties in the urban areas. For example, the average response times for important emergency calls in Finland have decreased in general (especially in the Helsinki capital city area during recent years). Thus, the *average* efficiency may have increased, even though regional differences (variation) in service levels have grown.

Relatively little data is available regarding police work risk factors and the well-being of police officers in Finland. In a medical study, Niemi (2012) noted that police officers often spend a lot of time in a car or in the office, and this kind of work increases the risk of diabetes and cardiovascular diseases that are associated with being overweight. Vuorensyrjä (2012) noted that the risk of physical harm toward the police officer or his/her family was considered small in Finland, but police work was considered very hectic. Further, an insufficient flow of information and unwanted leadership styles were seen as possible causes of work-related stress (ibid.). Moreover, repetitive administrative duties and complaint management tend to be disliked, and, obviously, the perceived fitness level required for field activities deteriorates with aging (ibid.).

In the six Finnish follow-up interviews (Appendix 1), it was found that without clear rules the employees cannot know what is expected

from them, a situation which may lead to lack of focus, frustration, and subsequently low job satisfaction. Further, there is a risk of non-equal practices and costly errors if clear rules for operations are missing.

> Now [after a fusion of 5 small police units] . . .formal bureaucracy or administration has increased. . . . Some feel it is frustrating but . . . it is necessary. [Interviewee 3]

Under the recent tight economic situation, there has been a clear focus on financial issues and budgetary discipline in police work planning. By prioritizing their operations (e.g., having police officers present at known problem times, such as Friday nights), the police department has managed both to reduce costs and to improve their average response time KPI. With emphasis on a certain KPI (the average response time) and with careful risk-based work planning, the cost-effectiveness of the police has improved.

> We can't be waiting in scarcely populated areas if there is a call. . . There is little traffic and few missions. . . We need to shape our operations according to case density (or crime risk) in order to focus our operations on places where there is the greatest call pressure. [Interviewee 3]

> In a way the maximum sentence of certain crime indicates its severity, or weight but. . . we don't weigh our cases . . .Our recent organization changes are financially based but recently. . . severe crimes have become more prominent, such as organized crime, financial crime and drug crime, and they are not issues just for the local village. [Interviewee 1]

This shaping of operations based on crime risks suggests that cost-effectiveness can be improved with risk analysis. However, optimizing of resources may lead to risk of physical harm if suddenly there is a need for more force and back-up units are unavailable.

## Quality, Cost-Effectiveness, and Risk Performance Measures: Some Proposals

### Police Work Quality: The Comparative Quality Factor (CQF)

At the organizational level, next, the use of the *Comparative Quality Factor (CQF)* is proposed as a practical complement to the KPIs already disclosed. The Comparative Quality Factor (CQF) is a weighted average-based performance measure that considers the improvements in the operational quality of work and applies the improvement percentage to the actual amount of output produced, in order to get a comparable figure for the output between separate years, countries, or areas. For example, if the quality of service has improved by 1%, the output now is comparable to 1.01 times the output before (assuming some linearity and complementarity in small changes). The quality of police work is difficult to measure, but the crime solving percent and the timeliness of operations (measured according to response times) may be considered proxies for quality. The solving percent might be weighed with the severity of crimes (judging from the average or maximum sentences), if considered necessary. However, the respondents were relatively reluctant to prioritize solving crimes but thought that the police should try to solve everything in order to give a reliable signal to the public. Therefore the first part of the CQF formula (with 50% or 1/2 weight) is calculated based on the *solving percent of the equivalent number of crimes*, and the second part (also 50% weight) is calculated based on the *average response time*.

$$\mathrm{CQF} = \frac{\text{Solving\%in year X}}{\text{Solving\%in year X} - 1} * \tfrac{1}{2} * \frac{\text{Crimes in year X}}{\text{Crimes in year X} - 1} + \tfrac{1}{2} * \frac{\text{Response time in year X} - 1}{\text{Response time in year X}}$$

The CQF formula is designed so that continuous improvement is striven for. It is considered that improving the solving percent (solving more crimes) is a good thing, especially if the workload (number of reported crimes) has increased. It is assumed that the number of crimes and the distribution of different crime types are relatively comparable among years. Finally, getting to the crime scene faster is considered a good thing, and a shorter average response time in minutes compared to the previous year improves the CQF (because the response time of the previous year

is over the division line). The interpretation of the CQF formula is that if the CQF is above one, the effectiveness (also a proxy for quality) of police work has improved.

### Illustration of the Police Work Cost-Effectiveness Index

The case analyses show that police work cost-effectiveness is not easily captured. However, in order to have research results that aim at practical developments (Kasanen et al. 1993), next the *Police Work Cost-Effectiveness* index (PWCE) for aggregate level police work analysis (the organizational or even societal level) is proposed. The basic idea of the PWCE index is to calculate the cost of comparable (equivalent) services. For example, the value for the ratio of "Funding/number of crimes" can be multiplied by the Comparative Quality Factor (CQF): see PWCE formula below.

$$\mathbf{PWCE} = \frac{\text{Total Police Funding Year X}}{\text{Total crimes in year X} * \mathbf{CQF}} = \text{Equivalent police cost} - \text{effectiveness}$$

The CQF adjustment facilitates better (albeit not perfect) comparability among years and countries. This kind of simplified measure might be useful in decision-making as a proxy measure of progress. The costs per solved (equivalent) crime might be of use in assessing how economical the police work is, but the PWCE type approach (e.g., the CQF) reacts to improvements in multiple areas of service, for example, in crime solving and in the timelines of services, thus also potentially revealing trends in police work cost-effectiveness.

### Risk-Adjusted Measurement

Davies (2017) mentions assessment of threat level and other risks in use-of-force situations. However, threat levels or the importance of assignments are difficult to decide either personally or at an organizational level. For organizational level analyses, preliminary risk analysis approaches are next presented, e.g., for prioritizing different crime cases in police work. First, the risk categorization is presented in Table 1. The different duties are graded using several categories of importance. However, in Table 1, the different columns are not related but represent independent categories so that, for example, the probability of the crime to recur is not related to the monetary value of the crime. The probability to recur means whether the criminal if not caught is likely to continue committing crimes that cause significant harm to others. Monetary value is involved, for example, in burglaries and in financial crimes. Small monetary amounts might be given little weight (low grading). Crimes with a high maximum sentence have already been considered more severe and more important by the legislative bodies. High societal interest may be involved in crimes made against political or business leaders or against nationality or religious groups, where the press may be very interested and even the image of police is in question. However, if it is (almost) certain that the criminal cannot be caught at all, the police should not prioritize that kind of investigation. The average grades of the different categories are then added up in order to form an *overall total expected risk score*. The more the total expected risk score of a crime is, the more priority is given to the duty or investigation in question.

For example, if probability of recurrence is high, monetary value is medium, maximum sentence is 4 to 10 years, and societal interest is low;

**Measures for Police Performance in Spain and Finland, Table 1** Example risk categories (A–D) and grading for prioritization

| Grade (given independently for categories A to D) | (A) Probability of recurrence if not caught | (B) Monetary value involved | (C) Maximum sentence (years) | (D) Societal interest/ image importance |
|---|---|---|---|---|
| 1 | Very small | Low | Less than 1 | Low |
| 2 | Small | Medium | 1 to 4 years | Medium |
| 3 | Medium | Large | 4 to 10 years | Large |
| 4 | High | Very large | More than 10 | Very large |

an overall expected risk score of 10 (i.e., 4 + 2 + 3 + 1 = 10) is formed. Additional risk categorizations might include using risk data for the time of day, or for the area (e.g., crimes performed in certain city areas). This information might be used in planning patrol routes and work hours for police officers.

At the personal level of risk measurement, personnel surveys and interviews might be most feasible assessment methods. However, considering the expected impacts of different aspects of police work on well-being might be made using the *expected (or perceived) risk impact* (ERI) measurement, presented in Table 2.

In the example in Table 2, the variables include examples mentioned in earlier research (e.g., Hart et al. 1993). The probability estimations are subjective examples used for weighing the effect of different types of risks on the citizens' perceptions (used, e.g., in Spain). The expected effect on police well-being is estimated here using only categories 1–4. The effect grades in this example are 1 (mild positive), 2 (strong positive), 3 (mild negative), and 4 (strong negative). They suggest that negative effects on perceived police work well-being may be more important to avoid than positive effects are to obtain, especially regarding motivation. Further, the impacts of events and personal responses to stress factors (personal danger in use-of-force situations, repetitive work, etc.) may differ among persons, positions, and police organizations (Davies 2017). Further, even with a low probability, a very high-impact event, such as a police officer being killed on duty, may affect the working capacity of several fellow officers. Overall, the motivational and personal aspects of police work do not seem to be much considered both in Finnish and in Spanish police work reports. Some information may be confidential, but there may be a lack of focus on these issues by the central police managers.

## Discussion and Conclusions

This entry compared KPIs and PM practices in police services in Finland and Spain. The current police PM indicators in both countries seemed insufficient for improving quality, cost-effectiveness, and risk measures. As the KPIs may gradually affect behavior and motivation, the focus of control should be carefully considered in each organization, even among differing police work activities, where the focus may be on outcomes or on processes. Further, relatively little information about police work risks and well-being was disclosed, either at the personal or organizational level. As a limitation, but also as a result of this study, a notion can be made that the publicly disclosed police KPI data lacks comparable risk and quality data and measures, which may hamper the possibilities to motivate police officers. Consequently, new indicators for both academic researchers and practitioners may facilitate developments in operations, in risk management and in PM in police work – and possibly in the changing public sector more generally.

Police work is affected by multiple requirements and risks, both at individual and societal levels, which can blur the focus of work but also serve as ways of prioritizing operations and building new KPIs. The multiple risks also complicate police work and thereby affect the pressures and stress felt by police officers, in turn affecting the level of job satisfaction of police officers. Besides personal risk or threat level assessments

**Measures for Police Performance in Spain and Finland, Table 2** Examples of the Expected Risk Impact (ERI) grade at the personal level

| Variable | Probability to occur/ accentuate (during a year) | Expected effect on police well-being and work quality | Expected Risk Impact (ERI grade) |
|---|---|---|---|
| Police salary increase | 40% | Strong positive (2) | **0.8** |
| Less manual reporting | 10% | Mild positive (1) | **0.1** |
| Personal health issues, e.g., overweight | 10% | Mild negative (3) | **0.3** |
| High stress or burnout % | 20% | Mild negative (3) | **0.6** |
| Danger or physical harm (e.g., police being shot at) | 10% | Strong negative (4) | **0.4** |

(Davies 2017), different risk-adjusted measures for the various levels of police organizations can be constructed. Typically the operational (or practical) issues are emphasized in local police work, but financial aspects are more and more emphasized at upper organizational levels (Rautiainen et al. 2017). However, causal links between overall results, spending, and the time allocated to various policing tasks are not clear and require further research. By improving and prioritizing processes, some (administrative, etc.) duties may be made faster, thereby allowing more time for strategic and operative tasks. This would diminish the amount of repetitive administrative duties and PM, which may affect both cost-effectiveness and officer well-being (Vuorensyrjä 2012).

The comparability of KPIs between years, countries, and organizations is not always clear, and some of the disclosed police KPIs do not reveal much about police work cost-effectiveness, for example, in preventive work (e.g., Carmona and Grönlund 2003; Navarro-Galera et al. 2008). A lower amount of investigated crimes may be a sign of the efficiency of preventive work but also a sign of inefficiency, apathy, or lack of resources. Without knowledge of the risks and effects (or perceived severity), i.e., long-term impacts of crimes, it is not clear whether it is better to control traffic or sports events or focus on financial crimes. Therefore, in this entry, ways to prioritize and measure police work were presented, and the adoption of balanced KPIs considering the risks was promoted. Police performance cannot be assessed by financial terms only but also by citizen safety and other measures. With risk-informed decisions, there are possibilities for having risk-adjusted processes that improve the cost-effectiveness of police work (even if it is still difficult to measure; see Batac and Carassus 2009). Moreover, developments in police work should not be arbitrary but based on risk analysis and political consensus, allowing for long-term developments (Collier 2006).

In order to serve both practical and academic interests (Kasanen et al. 1993), new PM tools, namely, the Comparative Quality Factor (CQF) and the Police Work Cost-Effectiveness index (PWCE index), were presented. Further, risk-adjusted performance measures, such as individual perception-based ERI (Expected Risk Impact), were presented. These may facilitate analysis of cost-effectiveness and finding relevant leading indicators of police performance locally, nationally, and internationally. Further, by developing PM, some of the interests of creating client satisfaction, fair treatment of individuals, achievement of social outcomes, and creating just social relationships may be balanced. Finally, if there is crime density-related data, the most probable crime scenes might be estimated based on experience or using computer simulation. Thus, there are several future research lines, such as modelling and analyzing service work in public administration among countries and analyzing the effects of different risks in police work as well as the practical usefulness of the suggested new tools.

## Synonyms

Cost reduction; Costs and income; Healthcare; Level of consumption

## Definition

It refers to the correct level of consumption of resources to achieve a better health status for the patient.

## Introduction

Measuring efficiency in hospitals has become a major topic in health policy and applied economics in the past three decades. Efficiency in hospitals refers to the correct level of consumption of resources to achieve a better health status for the patient, and it has been analyzed at the country level, as well as in cross-country analyses. Faced with an increase in the complexity and number of population healthcare needs resulting from a gradual aging of the population and an increase in social inequality, the sustainability of the structure of the provision of health services is an increasingly central problem. The aim of the healthcare systems should be to ensure an adequate level of quality of the healthcare provided to citizens using the least resources possible.

Since most countries have based their healthcare systems on public hospitals, it is necessary to control the efficiency level of such hospitals because they are strongly connected to public spending. There is a growing pressure internationally to contain healthcare spending and to improve the performance of health services (Hollingsworth 2012). Thirty years ago, little attention was paid to public spending and there was the belief that hospitals should provide every care necessary, without considering costs. Measuring efficiency, along with quality and productivity, is necessary for providing suggestions to hospital management and medical and nursing for improving the performance of healthcare services. Measuring efficiency is also necessary for ensuring efficient management of activities (such as first-aid accesses, recovery, surgery, outpatient visits), scheduling for future health programs, and continuous monitoring of them. This contribution highlights the concept of efficiency in hospitals, why it is important to measure this efficiency, the different types of efficiency, and how it is possible to assess levels of efficiency.

## Key Variables for Measuring Efficiency in Hospitals

Technical efficiency refers to producing the maximum output in relation to input or to producing a set amount of output using the minimum of input. If an organization is technically efficient, it is operating on a production frontier. Allocative efficiency refers to an organization having an input

mix that minimizes cost, given the input prices, or having an output mix that maximize revenue, given the output prices. Together, technical and allocative efficiency represent overall efficiency. An efficient organization is operating on its cost or revenue frontier (Farrell 1957). Efficiency differs from productivity because productivity refers to the ratio between an output measure and a measure of the input used; however, efficiency refers to the maximum output achievable with the available input. Indeed, hospitals' activity can be assessed at the correct employment of resources to produce the desired output and their contribution to the improvement of the patient's health status. Efficiency and effectiveness are closely connected, but it must be clear that efficiency differs from effectiveness, productivity, and quality. Quality in hospitals is connected to waiting times, perceived quality of healthcare from the patient or their friends and relatives, accuracy of provided care, and the mortality rate of in-hospital care.

In hospitals, efficiency refers to the provision of the maximum or correct level of care to patients using the minimum resources possible. As stated, in many European countries, healthcare systems are principally composed of public hospitals (such as Italy, France, Spain, UK, Norway, Sweden). For example, hospital management can control the resources utilized (e.g., labor, direct costs), while other indicators such as the number of patients or days of hospitalization cannot always be controlled. It is not easy to achieve a high level of efficiency in hospitals because physicians are motivated to provide the correct healthcare to a patient and do not always understand the resources being consumed; indeed, it is important that physicians also have a managerial approach (Kumpusalo et al. 2003). It is also difficult to achieve high levels of efficiency in hospitals because most of countries finance their healthcare systems through the Diagnosis Related Groups system, which means that revenues are fixed, and to improve net income, resources must be employed efficiently. In the early 1990s, on the wave of New Public Management, efficiency became very important for public hospitals, and there was an increasing necessity to monitor the hospital internal situation through performance-management systems of control to better manage hospitals, to schedule new topics, to achieve greater efficiency, and to reduce the public resources used. A performance-management system is also important for monitoring organizational efficiency within hospitals because if efficiency is not controlled, it cannot be measured, and if it is not measured, it cannot be improved. In hospitals, the recipients of the information gained from the performance-management system are the management staff, the physician staff, and the nursing staff, as well as legislators who must use the information to improve the entire healthcare system of the country. From a perspective of corporate social responsibility, patients and the general population should also be informed on how the public resources are spent and which areas are improving and which areas are suffering degeneration. When hospital efficiency is examined, it is important to distinguish between input variables, refer to materials, labor, and invested capital, and output variables, refer to hospital production, for example, number of admissions, number of outpatient visits, and outcome measures which are related to the effectiveness of the care provided.

The input variables most used to measure the efficiency level of hospitals are the number of beds, the number of full-time equivalent staff (e.g., physicians, nurses, and other clinical or nonclinical staff), and operating costs. The input variables usually include material and labor measures. The number of beds is a proxy of the hospital size and of investment capacity. The number of physicians and the number of nurses are the two principal input variables employed to measure hospital efficiency. This is due to the importance of the resource of labor in production processes. Operating costs are often divided into costs of medical supplies, labor, supplies, and other operating costs. Supplies represent a proxy for material resources.

There is less unanimous research consensus in the past years on what constitutes outputs in measuring hospital efficiency. However, the most relevant outputs employed are number of discharges, number of admissions, number of outpatient visits, number of patients per year, number of surgeries,

and days of hospitalization. In the past 40 years, lots of studies have used days of hospitalization as an output, despite sometime this variable has been used as possible efficiency determinant (Hollingsworth 2008). In studies on hospital efficiency, output typically accounts for the activities. The volume of the patients the hospital must manage is considered one of the natural outputs of their own business. However, hospital users want to improve their health status (through hospitals services), so output should be measured in terms of health outcomes. For this reason, many researchers used both activity measures and health-outcome indicators as outputs in their studies.

The outcome indicators employed in researches include mortality rate, unplanned readmission rate, percentage of surgeries with decubitus, and percentage of surgeries deleted (e.g., Bilsel and Davutyan 2014).

Most studies on healthcare efficiency employ Data Envelopment Analysis (DEA) developed by Charnes et al. (1978), with a second important development by Banker et al. (1984), to evaluate hospital efficiency (Hollingsworth 2008). Sherman (1984) was the first study to evaluate hospital efficiency using Data Envelopment Analysis, and Färe et al. (1994) was the first study to employ Data Envelopment Analysis to measure hospital efficiency in Europe, after which, the method became widespread among researchers. Recently, researches in hospital efficiency have made increasing use of parametric methods, principally Stochastic Frontier Analysis (SFA), which is an econometric and parametric approach that was first introduced by Aigner et al. (1997) and Meeusen and van Den Broeck (1977) as a form of production function to estimate productive inefficiency. The estimated error is divided into two components: inefficiency error and random error.

Data Envelopment Analysis allows the researcher to obtain a ranking of hospital efficiency, which then allows the investigation of efficiency determinants. Data Envelopment Analysis creates virtual units and benchmarks these to other decision-making units. While Data Envelopment Analysis cannot test hypotheses because it is based on mathematical programming, Stochastic Frontier Analysis is a parametric method that can test hypotheses, and it separates noise from efficiency scores of Decision Making Units. Banker (1993) suggested combining Data Envelopment Analysis and Stochastic Frontier Analysis. Data Envelopment Analysis is a non-parametric technique, which is often used in operational research to assess the efficiency performance of decision-making units. The method uses the observed input and output to evaluate the production frontier using mathematical-programming techniques. The relative efficiency is the ratio of total weighted output to total weighted input. The ratio ranges are from zero to one; when the ratio is equal to one, the Decision Making Unit is considered relatively efficient. There are two configurations possible of the Data Envelopment Analysis: the input oriented and the output oriented. The input-oriented approach denotes the ability of each Decision Making Unit to minimize the input consumed for a given level of output. The output-oriented approach denotes the ability of each Decision Making Unit to maximize the level of outputs for a given level of inputs. The most widely used of these configurations in analysis of the healthcare sector is the input-oriented approach because hospitals tend to hold health gains constant and minimize inputs. In addition, for hospitals this approach is preferable because hospital management can control the number of staff and costs, while the number of treated patients can be considered an exogenous factor. In the literature, it is common to find a two-stage approach with the first step of efficiency measurement through Data Envelopment Analysis and the second step with an assessment of efficiency determinants within regression analysis. However, recently, there has been an increase in the use of the Data Envelopment Analysis within bias correction through the bootstrap approach developed by Simar and Wilson (1997). Recent developments with Data Envelopment Analysis are the additive Data Envelopment Analysis model and the dynamic network Data Envelopment Analysis model, which as an example were used by Kawaguchi et al. (2014) to assess efficiency in Japanese hospitals.

## Factors Affecting Efficiency

To measure efficiency in hospitals, researchers should pay attention to the selection of variables. Some exogenous factors have an important effect on efficiency, such as demographic characteristics (density of the population, age), size, and public or private ownership. Endogenous factors related to hospital efficiency include the case-mix, complexity of admissions, and skills of medical staff.

The principal findings highlight that hospital size is positively related to the level of efficiency; and days of hospitalization are negatively related to the level of hospital efficiency. In examining the effect of ownership structure on efficiency level, United States studies have demonstrated that public hospitals have a higher efficiency score than not-for-profit hospitals. Research has also found that private hospitals tend to be more efficient when they have more than 1,000 beds (Ramamonjiarivelo 2016; Ding 2014). Studies on European healthcare providers have found that public hospitals have a higher level of efficiency than private hospitals (e.g., Hadad et al. 2013). However, Guerrini et al. (2017) found that a high-competitive context, private hospitals have higher performance in productivity and cost saving than public hospitals. Generally, teaching hospitals are found to have higher costs because of the cost of providing medical education and research (Hollingsworth 2008). In addition, big hospitals have higher performance than smaller hospitals, principally due to economies of scale (Porter and Teisberg 2006). Most studies include only one year in their analyses despite the results of longitudinal analyses being more robust (O'Neil et al. 2008). Days of hospitalization have been found to have a negative effect on efficiency level (Staat 2006). An average age of patients higher than 65 has a positive effect on hospital efficiency, which is attributable to the higher demand of healthcare services required by the elderly population (Hollingsworth 2008).

The most relevant findings of Stochastic Frontier Analysis analyses of hospital efficiency are that not-for-profit hospitals are most efficient, followed by public hospitals and for-profit hospitals. Stochastic Frontier Analysis studies in healthcare focusing on nursing homes have found that the ownership structure is not a significant factor in levels of hospital efficiency (McKay et al. 2003).

These findings of previously studies should be used to provide advice to improve the management of hospitals, with particular attention being paid to hospital production and review of healthcare planning.

New researches on hospital efficiency should adopt the Data Envelopment Analysis method with a bootstrap or double bootstrap and consider for the outputs: number of discharges, number of admissions, number of outpatient visits, number of patients per year, number of surgeries, or days of hospitalization and for the inputs: number of beds, number of full-time equivalent physicians, number of full-time equivalent nursing staff, and operating costs. Until recently, research evidence into hospital efficiency highlighted the trade-off between efficiency and quality. However, more recent research includes qualitative indicators of hospital efficiency (e.g., outcomes such as in-hospital mortality rates, mortality rates in 30 days after the discharge, case-mix index, and rate of surgeries with decubitus) and has found no such trade-off. For this reason, it is suggested that research on hospital efficiency should include quality and outcome indicators to better understand whether resources are used correctly and contribute to achieving a higher level of quality, rather than simply focusing on reducing the amount of resources consumed.

# Measuring Leader Effectiveness

Cassandra R. Henson
College of Health Professions, Interprofessional Health Studies Department, Towson University, Towson, MD, USA

## Synonyms

Good governance; Leadership; Leadership competencies; Performance measurement; Public administration

## Definition

A *leader* is a person with the ability to inspire and motivate those within their work environment. *Leadership* is the act of leading, persuading, and guiding individuals and organizations toward a common goal.

## Introduction

Public administration is indeed an ever-changing environment, and we therefore need leadership that can continue to change and evolve with it. We must continue to grow our field while ensuring effective communication and collaboration with the private and social (nonprofit) sectors. Of course we typically look to senior-level public leadership for the management of this process, and recent research efforts have given some feasible suggestions as to what the role of the public leader should look like. How then should public leaders and their leadership be measured? This article will discuss the foundations of leaders

and leadership, as specifically relevant to public administration. Methods for measuring effectiveness will be suggested, as well as a discussion on what may be needed for the future of public administration.

## Foundations of Leadership

*Leadership Theories*. There have been numerous leadership theories to emerge over the years, and we can each undoubtedly point to a favorite. The opinion of an ideal leader and the traits possessed is quite subjective, but the differences in theories may not be as vast as once thought. Discussion here as it pertains to foundations of leadership theory details a few well-known theories highlighting two distinct approaches: independent and collaborative (Amanchukwu et al. 2015; Roman and McWeeney 2017). Independent theories argue that leadership capabilities lie with the individual, with no (or little) dependence on extrinsic forces and environments. Collaborative theories, however, consider those external environments as well as people that impact the success of leadership. The "great man" theory describes leadership characteristics as natural talent. Basically, this theory implies that the ideal leader is born to be in the role, not simply trained to be. In this theory all successes are to the sole credit of the leader. Similarly, the "trait" theory argues that potential leaders are born with certain traits and values that make it easier to become successful leaders (above average intelligence, integrity, superior decision-making abilities, etc.). The two previously mentioned independent theories dismiss the external influences and environments that impact leadership as well as the associated decision-making required in such a role. The next few theories will briefly discuss collaborative ideologies.

The "contingency" theory implies that leadership and its success is dependent on the environment in which it operates, contrary to the underlying concepts that support the great man and trait theories. In this scenario, certain leaders will excel in certain situations but may perform less than optimally in others. "Participative" theory values the input of others in the decision-making and operational processes. Leaders actually motivate and persuade by encouraging participation by those involved in the achievement of goals or objectives. "Transactional" or "exchange" theory requires a somewhat reciprocal relationship with those seeking guidance from a leader, with consensus on goals or objectives to be accomplished. There are motivational strategies (intrinsic or extrinsic) as well as reward systems implemented by the leader to insure that the agreed upon goals are met. "Skills" theory acknowledges the presence of natural skills and abilities as identified in the independent theories, but focuses more on the skills and knowledge obtained by professional experience and training. Many organizations today follow the skills theory and have dedicated substantial resources to their leadership training and development efforts (Wolinski 2010). "Transformation" theory states that leaders use personality traits to transform others, as they gain support and buy-in for goals and objectives.

## Leadership or Management: Is It All in the Title?

*Leadership* is the act of persuading or guiding others in accomplishing specific organizational goals and objectives (Buchbinder and Shanks 2017). This often social position has the ability to affect real change within an organization's culture, at virtually all levels including the bottom line. Leaders are often without the official title but have the necessary personality traits to persuade peers and colleagues – honest dialogue, integrity in the workplace, and trustworthiness being among the most common of traits.

Every work environment is different as is every industry, presenting quite the challenge for even the most experienced of leaders. Several types of leadership emerge in response to specific needs and functions of the organization, focusing on both internal and external priorities: operational, strategic, and network (Buchbinder and

Shanks 2017). Operational leaders are internally focused, with primary responsibilities lying with the daily routine processes of the organization. Strategic leaders are both internally and externally focused, with efforts centered on the organization as a whole – mission, values, and vision. Network leaders are externally focused, concentrating on the relationships with others in the community and industry. Some of the determining factors of the type of leader needed are size and focus of the organization, amount of communication needed (internally and externally), and the organization's relationship to the community and industry.

*Management* is the control of an organization's resources, utilized to achieve the identified strategic goals. At this level, titles and power are official with specific functions required, but there is still significant support needed from the leaders (Buchbinder and Shanks 2017). The key management functions are strategic planning, reporting and organizing, staffing (training and development), controlling/directing, and decision-making. The accompanying management competencies are conceptual skills (big-picture thinking), technical skills (information technology and task-specific systems), and interpersonal skills (communication and social interactions) (Buchbinder and Shanks 2017).

*Management and Leadership*. Are managers natural leaders within an organization? Are managers and leaders the same? Many would venture to believe these to be true, but it is not the case. The functions are different for each, but the organization needs the partnership of the two to be operationally effective. Sound decision-making skills and management competencies are critical for effective public administration leadership. As professionals, we have become quite adept in transforming theory into practice, but not without the real-world events that have molded our experiences. The next generation of leaders must have the foundation and ability to react quickly, identifying issues within the public service, as well as collaborate to resolve issues within our cross-sector partnerships. The types of leaders (discussed in the next session) focus on different aspects of the real-world scenario, but it's the relationship with the management team that clarifies what needs to be done. The real world is a bit different now, and future public administrators must be educated and properly prepared for these new challenges.

## Measuring Effectiveness: Gauging Leader Performance

*Performance Measurement*. There are numerous schools of thought on performance measurement, but most still revolve around a few common elements. All include the foundational elements of sound mission, objectives, and some basic financial criteria, but begin to vary on which non-financial items are included in their analyses. Behn states that meaningful performance measurement requires a gauge and a context (2003); an effective gauge provides the criterion for measurement, while the context provides the scope within which to operate. According to Behn, the purposes for which performance measurement is used can focus on one specific goal or some combination of the basic eight outlined in his work: evaluation, control, budgeting, promotion, motivation, celebration, learning, and improvement (593).

*Leader Effectiveness Measurement Metrics*. Successful leadership is key to creating and maintaining a high-performing organization, starting with shared mission, vision, and values (Wooldridge 2007), but the challenge becomes how to measure this success. Performance in public administration must be both impactful and meaningful (Tummers and Knies 2013); therefore, the effectiveness measurement metrics used to gauge leader performance must cover a wide range of factors. Effective leaders must show evidence of commitment, motivating and team building, vertical and horizontal communication, and strategic/organizational awareness.

*Level of Commitment*. Leaders succeed when they find their work meaningful and containing purpose. As one identifies with an organization, believing in its core vision and mission, an

emotional attachment is formed creating a sense of satisfaction (Allen and Meyer 1997). With job satisfaction comes increased performance, and potential leaders emerge. These higher levels of commitment result in employees that stay with the organization longer and strive to do more than just the minimum requirement.

*Motivation and Team Building*. While most leaders are intrinsically motivated, others within the organization may require both intrinsic and extrinsic motivators to facilitate goal achievement. Personal values and desired accomplishments are often the intrinsic (internal) motivators driving those that believe in the purpose of the organization as well as the leader guiding the process. Extrinsic motivators such as additional pay, bonuses, status, or job title may be used to persuade those that may not be completely vested in the process. In most cases, there needs to be a balance (in some combination) of both types of motivators for job satisfaction to exist. An effective leader uses motivation to create the common commitment (no matter the intrinsic/extrinsic reason) to build teams, improve relationships, and increase collaborative problem-solving.

*Communication*. Effective communication plays a major role in maintaining employee engagement and commitment (Goleman 2000). Leaders must communicate with all levels of personnel within the organization, horizontal and vertical – with employees to strengthen relationships and commitments as well as with the management team, to be recognized as effective in their role. Communication competency often means improved employee and organizational performance (Garnett et al. 2008).

*Strategic/Organizational Awareness*. While the leader is not responsible for the creation of the organization's strategic plan, they are integral in the implementation of that plan. Ideally, the leader should possess a fair amount of "strategic awareness" – general knowledge of the key goals, objectives, and milestones. Motivation and team building efforts guide daily operations, interdepartmental relationships, as well as the strategic initiatives. Awareness of the organization's strategic initiatives also supports the efforts of the management team.

## Leadership in Public Administration: What We Need

Public administration, as with many other industries, relies on highly competent leaders to move forward, but the challenge appears to be identifying and supporting these leaders (Kellis and Ran 2013). The measurement metrics previously mentioned (commitment, motivation/team building, communication, strategic/organizational awareness) must first be introduced at the academic level. According to NASPAA (Network of Schools of Public Policy, Affairs, and Administration), core public administration competencies to prepare future leaders should include (1) public governance leadership, (2) participation in the policy process, (3) problem-solving and decision-making, (4) application of public service perspectives, and (5) productive communication (NASPAA 2017; Haupt et al. 2017). At the career level, additional support must be available to leaders by way of continued education, training, and development. New leaders must be trained to turn theory into practice, applying what they've learned to real-world scenarios. Public administration would surely continue to benefit from solid foundations and strong leadership.

## Conclusion

Leaders in public administration are an important driving force in efficient and effective agency operations. Strong leadership does impact outcomes, so efforts must be supported and honed by the organization. Integrity, honesty, and ethics must continue to be among the characteristics of leaders, to ensure continued employee engagement and commitment. Collaborative efforts between leaders and managers are needed to manage resources and deliver the desired results while incorporating the mission, values, and vision. Multiple styles of leadership may be necessary to address the internal and external needs of the organization; therefore, versatility of the decision-makers is key.

## Synonyms

Severe acute respiratory syndrome; Social investment program; Social media; Sound governance

## Definitions

Covid-19: A disease caused by corona virus that leads to respiratory illness while damaging the human immune system, transmitted through droplets of an infected person into another person's eyes, nose, or mouth and highly fatal in nature (Ekwunife et al. 2020c).

Government palliative: An approach that improves the quality of life of individual facing problems associated with life threatening illness

Media: This refers to mainstream and social media which gathered and disseminated information on covid-19 related issues in Nigeria.

Good Governance: This is contextually used as sound governance which in the thought of Farazmand (2017) refers to a more comprehensive governance that is less biased and has all the characteristics of governance that is superior to

M

good governance and is sound technically, organizationally, managerially, politically, and economically. It is democratic and responsive in character.

## Introduction

The phenomenon of coronavirus pandemic, known as covid-19, could not have been more predictable. BBC had reported in 2018 that experts believed a flu pandemic was only a matter of time and that there could be millions of undiscovered viruses in the world, hence the chances that the next pandemic is not worth ignoring. In 2019, US President Donald Trump's Department of Health and Human Services carried out a pandemic exercise named "Crimson Contagion," which imagined a flu pandemic starting in China and spreading around the world. The simulation predicted that 586,000 people would die in the USA alone. Therefore, if the most pessimistic estimates about covid-19 come true, the far better named "Crimson Contagion" will seem like a day in the park. As of 26 March 2020, there were more than 470,000 confirmed cases of covid-19 around the world and more than 20,000 deaths, touching every continent. This was understood to be a pandemic long before the World Health Organization finally declared it one on 11 March 2020.

Coronavirus, otherwise known as covid-19, is a deadly disease which is recognized as an infection caused by Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-COV2). The pandemic is highly contagious and spreads quickly, transmitting from person to person across the globe. Originally, coronavirus emerged in Wuhan city of China. Investigation reveals that cov2 is closely related to SARS like bat viruses. This implies that bat could be the bane of covid-19. The pandemic has touched every part of the world closely, and we should have seen it coming as it marks the return of a very old deadly and familiar enemy of all – both young and old throughout history. Perhaps, nothing has killed more human beings than coronavirus (Kumar et al. 2020).

According to a report published on 24 January 2020, corona virus infected patients have many common features such as fever, cough, and fatigue, while diarrhea and dyspnea were found to be uncommon features. Many of the patients showed bilateral abnormalities. Corona virus was isolated from bronchoalvelor lavage fluid in china in 2020. It was also detected in blood samples. Till now, corona virus was not confirmed in faces and urine sample of patients. While this is not the first pandemic experienced in global history and may not be the last, the entry for this study focuses on the role of the media in the coverage of covid-19 palliative distribution with careful attention to its implication on governance in Nigeria. Attention to the distribution of covid-19 palliative is so significant as the distribution reveals a lot about the managers of national resources and the insensitivity and unpreparedness of the ruling class to the perils of the vulnerable masses, hence, ***hungerdemic*** – a situation of virulent hunger among the people.

## Covid-19: Origins

The pandemic covid-19 emerged in Wuhan city of China and traveled down to 2003 disease outbreak known as Severe Acute Respiratory Syndrome (SARS). The virus belongs to the coronavirus subgroups, which initially affected China's population in Guangdang province. It spread rapidly around the globe with more than 200,000,000 persons infected and several deaths recorded. In 2012, another coronavirus disease was identified in Saudi Arabian nationals known as MERs-Cov (Middle East Respiratory Syndrome Coronavirus), which was also similar to SARS-Cov, as well as ARDS (Walsh 2020).

Investigations show that this disease has similar sources such as bats, dogs, snakes, and so on as the key carriers and transmitters of the virus. Recently in December 2019, China informed the World Health Organization (WHO) about her encounter with the outbreak of the disease in Wuhan City and the drastic spread of the phenomenon which had infected more than 50 persons. Also, it was suggested that persons infected by the virus in Wuhan City of China might have visited the seafood market where live animals like bats, snakes, dogs, rabbits, birds, among others were

sold, or perhaps contracted the virus from consuming the seafoods (Muhammad 2020; Ekwunife et al. 2020c).

On 30 January 2020, the outbreak was declared a public health emergency of international concern. The international community asked for US $675 million to help protect states with weaker health systems as part of its strategic preparedness and response plan. Also, on 11 February 2020, WHO announced a name for the new coronavirus as covid-19, and findings revealed that covid-19 spreads even without the record of visits to seafood market or through its consumption but through human to human as cases have been recorded in more than 100 countries across the world.

## Covid-19 and Nigeria Experience

Nigeria having the population worth over 200 million people, and one of the most populous among the black nations worldide, officially recorded the outbreak of covid-19 pandemic in the country on the 27 February 2020. A 44-year-old Italian citizen was diagnosed of the virus in Lagos State. This was the first case confirmed in Nigeria since the government of China reported its first case in January 2020. As stated on the 24 February 2020, the case arrived the Murtala Muhammad International airport, Lagos State, at 10 pm aboard Turkish airline from Milian, Italy. Report showed that a total number of 16 contacts under follow-up were identified in Lagos State while 36 contacts were identified in Ogun State as a result of the case trip to his company site in Ogun State on the 25 February.

Following these events, the outbreak in Nigeria was announced on 28 February 2020 at a press briefing at 9:30 am by the Honorable Minister of Health. A multisectoral national Emergency Operation Center (EOC) was also activated at level 3. As the highest level of response in the public emergencies led by NCDC, two rapid response teams were deployed to Lagos and Ogun States, respectively, on 28 February for the ongoing risk communication campaign across the country. No doubt this pandemic is still considered a nightmare to Nigerians as well as other countries around the world, placing the world in a condition of inconvenience and hardship (Independent Newspaper 2020).

Following the outbreak of covid-19, activities within and outside the country were withdrawn in respect to managing the spread of the disease. These measures include travel ban on 13 countries with high cases of covid-19 such as China, United States, Spain, Germany, South Korea, lran, Japan, Switzerland, Netherlands, United Kingdom, Italy, and Norway. Schools and institutions of learning were also closed down indefinitely. Transportation, markets, and businesses have faced serious bans as well as religious gatherings above fifty worshippers, among others (Lawrence 2020). Following these restrictions, the National Youth Service Corp activities were also suspended indefinitely, including the Nigeria Football Federation and the National Sports Festival. Furthermore, following the continuous increase of cases confirmed in the country, the government of Nigeria announced a compulsory lockdown and measures to contain the spread of covid-19 in the country. There was the provision of isolation facilities to localities, testing equipment targeted at identifying persons infected by the virus as regards contact tracing, since more than 30% of all cases in the country are found through contact tracing.

There is no doubt that Nigerians experienced difficulties in the lockdown since their everyday livelihood was greatly tempered with. There are now evident concerns that the pandemic has spread further than it was initially expected to. Following the recent mysterious spike in the increased number of deaths in parts of the country, local grave diggers have raised concern of burying larger number of bodies than the usual.

Thus, there is an outbreak in the country, activities suspended, prices of goods and services increased, several persons are getting infected daily, more death cases including young and old, the rich and the poor are recorded with few recovering. Individuals cried, grieved, and lamented because their movements were restricted and lockdown imposed on them. The poor and most vulnerable people in the country were left to hunger and thirst, and frustration has turned individuals to embrace robbery, leaving the country in misery (Alamba 2020).

## Covid-19 and Government Palliative

In the world today, the covid-19 pandemic has exceedingly displaced and disrupted all human activities and everyday living as a result of its unprecedented outbreak. To this effect, on April 13 2020, the President of the country Muhammad Buhari announced a continuing lockdown already imposed in Lagos State, Ogun State, and Abuja – the Nation's capital. Of course, other states were not excluded from these measures as a result of the increasing rate of confirmed cases in the country (Okon 2020). Also, in respect to the containment and fight against the spread of the disease, the Federal and State governments of Nigeria announced and introduced palliative measures as means to support the citizens to enable survival during the lockdown.

Thus, the initiative of palliative measures by the Nigeria government has so far prompted notable and commendable donations from prominent personalities and corporate organizations towards assisting the poor and the most vulnerable people in this period of covid-19 pandemic. However, the reverse seems to be the case as the announced economic assistance by the Nigeria government proves to be compromising, following the process of the palliative disbursement which failed to accomplish its supposed purpose of reaching the vulnerable it was intended to reach (Nwite 2020). Hence, considering the palliative measures announced by Federal and State governments comprising of conditional cash transfer of 20,000 naira (US $52), 50 billion Naira facility by Central Bank of Nigeria, loan repayment waivers, and distribution of food rations, among others were released.

Unfortunately, tears and lamentation trailed continuously among Nigerians, especially in the most affected parts of the country such as Lagos State, Abuja the Federal Capital, Ogun and Kano States as a result of the inadequacies deployed in the palliative distribution process. It is important to note that individuals upon sighting the limited items made available, supposedly intended for millions of Nigerians lost interest as it was proven to be hijacked by middlemen. Following individuals' witnesses, the rate of irresponsibility and undeserving attitudes portrayed through politics in distribution locations of the inadequate relief packages made available is highly condemning and insulting to Nigerian citizenry. Hence, this inadequacy and incompetence deployed towards the palliative distribution to the populace whose daily livelihood depends on everyday earning does not measure up with global best practices in the light of sound governance. More so, it proves that politics has no boundary. It is indeed embarrassing and spite that political elites in Nigeria whom the citizens look up to for assistance prove to be mischievous and appear to be more in need of these palliatives at the critical period of pandemic than the vulnerable. This is evident as already revealed in the quest to latch every opportunity to exercise politics, blinded by continuous ambition of acquiring electoral fortune, thereby constituting irresponsibility towards the disbursement of palliatives to the deserving Nigerians.

In respect to international human rights, Nigeria is obligated to protect people's right to an adequate standard of living, including adequate food and nutrition for the highest attainable standard, health, and right to social security in times of economic crises. Also, countries must demonstrate that they have made every effort to mobilize all available resources, including international assistance, and allocate them in a way that maximizes respect for human rights. This should take into account the precarious situation of disadvantaged and marginalized individuals or groups. Governments are obligated to ensure access to food, water, health care, and other basic needs for everyone at all times, and in particular those subject to lockdown and other severe restriction on movement.

In view of this, Nigeria government is expected to create a plan of action to provide economic relief or support to its populace who is already suffering due to hunger and frustrations incurred as a result of the lockdown, particularly poor households who are not buoyant enough to stock food and purchase health materials prior to the sudden notice of government's decision of an imposed lockdown. In addition, the government is expected to deploy the greatest level of transparency, honesty and efficiency, showing commitment in its responsibility of adequately distributing the provided palliatives across the

country. This will prove and or ensure harmony as well as genuine acceptances from everyone under this present catastrophe caused by COVID 19 pandemic.

## Covid-19 and the Media

The media as the fourth estate of the realm or arm of government has long been recognized as a powerful body responsible for reporting the activities of the government. It plays the role of surveillance as it monitors the activities of the government. It is also a praise singing machinery (Ndolo 2011; Bittner 1989). The media shapes how individuals perceive the world. This roles are realized through adequate and proper research that follow closely the pathways of the technological mediums or channels of communication such as the internet, new media, radio, and television as well as the print media like newspapers, magazines, among others. The place of the new media, in particular, in shaping the world is summarized in the concept of the global village propounded by McMarshal Luhan in which the communication researcher views the media as miniaturizing or shrinking the world into a global village (Okunna 2012). The media being a relentless body in communication has long been exercising its responsibility of gathering factual information on events. In Nigeria, the media has struggled to cover the outbreak of covid-19 as they continue to work relentlessly to curtail and manage the disease through proper information, enlightenment, public education, and impact by promoting adequate responses for proper healthcare precautions and corresponding adherence by the public, as regarding measures targeted at preventing the spread of covid-19.

Moreso, following every necessary step in managing this pandemic, the media has gathered and published verified facts through multiple news stories, emphatic headlines, press briefs/release, and other numerous articles and updates, not minding the challenges and difficulties encountered as they sought for news on the disease. Therefore, the role of curtailing and possibly eradicating covid-19 and saving human lives remains the media's utmost desire and responsibility. This notwithstanding, media communication at some point is considered a rhetoric. This is on the background that the media outlets through control measures remain loyal to their proprietors since "he who plays the piper dictates the tune." The implication here is that many media outlets' coverage of covid-19 in Nigeria was awash with misinformation, fake news, and propaganda simply meant to protect certain interest (Ekwunife et al. 2020c).

Consequently, fake news, misinformation, fear, stigma, and anxiety created through social and mainstream media spread false information and sentiments concerning vaccination for health treatments. Other boiling areas in the media (particularly social media) were the spread of 5G network as the reservoir of covid-19. News also circulated about covid-19 infected nose masks and fairly used clothes deliberately imported from China with the intention of ensuring that Africans died in mass. All these information traffic were happening at the same time when the media paid attention to the statement credited to the wife of Bill Gates that bodies of Africans would liter the street unburied as a result of too many deaths resulting from the pandemic. The implication of this is caught in the writings of Ekwunife et al. (2020c), Ogbuoshi (2006), and Ndolo (2011) regarding the agenda setting function of the media. As these news stories caused traffic in both social and traditional media, they became issues of attention to the masses and elicited comments that heightened tension in the society, thus, corroborating the finding of Ekwunife et al. (2020a) that the social media in particular is a strong purveyor of misinformation in times of crises. There is no doubt that all this only has one motive to ravage the image of the country as well as poison the ignorant minds of the public at large. Thus, it is necessary that the recognized and trusted media organizations attempt to counter this challenge by ensuring balance and objectivity in the reportage of news and information sharing. Again, the media has exceedingly proven its function as an agenda setting body which does not necessarily tell people what to think but tends to tell them what to think about through constant discussions and debates

on the phenomena, "covid-19." By this, the media invariably sets agenda for the people.

In Africa, coronavirus is a reality. Recently, 38 countries and two territories in the WHO African region had reported infections, sparking fears that COVID-19 could overwhelm already fragile public health systems (WHO 2020). Though a key component of managing any crisis is effective communication (Ekwunife et al. 2020b), this could still be difficult during an infodemic. As the world scrambles to contain the coronavirus pandemic, the role of effective communication is becoming increasingly critical. Ntonjira (2020) observes that "health experts and governments need to position themselves as trustworthy sources of information to the public who needs to understand the situation, be aware of the precautions they can take, and stay calm."

Media outlets have so far exhibited commendable efforts in carrying out their agenda setting function as well as sensitizing the public on health matters relating to covid-19. Global Alliance for Public Relations and Communication Management (2020) has pointed out the need for the media to effectively report facts as obliged and in view of communication ethics that is mindful of the right source of information, and employing good language in the quest for truthful and effective communication.

## Media and Covid-19 Palliative; Challenges for Good Governance in Nigeria

In Nigeria, various precautions and measures have so far been implemented, but the threat which Corona virus poses seems to be a battle of an uncertain victory as people in the country are encountering various threats resulting from the global catastrophe. The pandemic has resulted in threats, panic, misinformation, politics of calumny, indecision, and hunger to crown it all. At the peak of the crisis in Nigeria, many persons, particularly in Lagos, defied the lockdown order out of hunger which became more life threatening than the corona virus.

Initially, panic and misinformation in Nigeria seem to be the order of the day, that is, the highest challenge faced by many in the country as the case of the virus continued to rise and spread. On the other hand, misinformation is said to take the lead role in triggering daily development of increase in the number of persons captured by panic. By this, individual States took proactive steps by closing down schools, markets, businesses, places of worship, transportation, etc. There was an indication that human behavior is controlled to inhibit the spread of the virus. This implies that people's behavior towards the disease can be changed in a way that promotes the spread of the virus and or which might endanger individuals' lives as it incurs more risk about the actual phenomena. Also, individuals suffer greatly from panic as a result of misinformation which is evident in Nigeria, leading people to wrong actions and complacency. Many individuals believed that black people could not get infected by the virus as well as the thought that chloroquine toxicity was an effective cure for the virus.

Furthermore, political activities associated with governance of a country are expected to have limits or boundaries towards its citizens as regards issues concerning the containment of a pandemic. It is also alarming to note that Nigeria's economy is in jeopardy (Ozili 2020). Stating this, "Nigeria Center for Disease Control confirms that no money has been released by the Federal government." The challenge and basis involved in the distribution of palliatives by the government to its citizens were also factors that disposed the country as lacking good governance. This is predicated on the platform that the same government has no data base of the citizens to enable equitable distribution of palliatives. Ekwunife et al. (2020c, 14) capture it in the following words:

> In view of sound governance which caters for the empowerment of citizens, a study of this kind questions this rationale for the distribution of palliative in a country that has no data base; a country where the average person lives on less than one dollar per day. These indices. . .are indeed a statement on the poverty level and the insensitivity of the ruling class in Nigeria

In the heat of this quagmire, the ex-governor of Anambra State, Peter Obi noted that "hunger cannot be quarantined." The truth is that while the media was flooded with the news of palliatives

and distribution, the masses complained of hunger and inability to receive any help from the government. It became a period when covid-19 middle men and fraudulent leaders enriched their pockets while the poor masses starved. Hence, nothing less than 100 million Nigerians were imprisoned by poverty following the total lockdown of the country by the Federal and State governments as a measure to curtail the spread of covid-19. There are millions of the country's citizens who are either unemployed or under-employed; people whose means of livelihood depends on daily income which the lockdown measure definitely worsened. Peter Obi, the ex-governor, explained in the media that it would be counterproductive to keep only the elites in mind when taking such far reaching decisions as closing down markets without having some cushioning means for the vulnerable.

It has been a nightmare for many Nigerians who were deprived of working and conducting their daily businesses since the pronouncement of the lockdown. Traders, local food vendors, and others have lamented greatly about their plight of not being able to feed their households during the stay at home, and the fact that they depend on daily earnings as their only means of survival aggravates matters. Using arrests and other stringent measures to control those who left houses as a result of hunger, the government proved insensitive to the plights of the vulnerable masses. This contradicts the principles of sound governance which Farazmand (2017) sees as governance that is responsive, managerially, economically, and democratically sound. Worse still, the media, particularly the government owned media, continually sang the praises of the political class as competent. It is no surprise that in every era, media content is controlled by media owners thereby straining editorial independence.

Looking at government palliative in response to covid-19, it is ridiculous to note that Nigeria's economic response to the distribution of the palliatives did not factually and adequately protect the most vulnerable people in the country. An increase in food prices as a result of the lockdown also means that many cannot stock up on necessities. According to Anietie Ewang (2020), "millions of Nigerians observing the covid-19 lockdown lack food and income that their families need to survive." The covid-19 experience in Nigeria revealed that the upcoming generations' fate in respect to academic pursuit is bleak and uninviting. This is evidenced in the reality show that while many developed systems were keying into online studies, there was not the slightest indication that any ray of light was going to shine for the educational sector in Nigeria; hence, all institutions were completely shut down without a ray of hope. There is no doubt that Nigeria has a weak and underdeveloped digital system even before the outbreak of covid-19, while the covid-19 only exposed these weaknesses, showing that there was no framework to cushion such a challenge or crisis. There is hardly any school or university that offers a full online educational curriculum from start to finish. Most banks and establishments operated on the traditional office mode as opposed to the home model being the major barrier faced by educational and business sectors in Nigeria as a result of not being technology inclined and prepared.

At present, the pandemic has not been declared over. The masses are still suffering their colossal losses which will not be recovered in the nearest time. In the face of these challenging situations, while the media is still loaded with the news of palliatives distributed by different countries, Nigerians have woken up with the news of hike in fuel and electricity tariffs, a reality which has added pepper to the open and painful sore. Worse still, while negotiations between the Federal government and the organized labor over the hike ended in deadlock, unarmed individuals who took to the street in Lagos State for protest have been arrested by the government (Citizen online, September 17, 2020). This is a statement on the democratic nature of governance and citizen participation, a society where legitimate means of registering misgivings by the masses are shunned, hence, autocracy in a democratic dispensation. This is antisound governance!

Consequently, the draining down of the economy and the lack of facilities in the nation's public health to manage both expected and unexpected health challenges is an indication that there is something fundamentally faulty with governance in Nigeria. No wonder many are clamoring and

agitating for a reconstruction of the country, and consequently, the economy so as to ensure equitable distribution of resources which is in tandem with good governance. This is most significant and timely since the formula for the covid-19 palliative distribution in Nigeria remains questionable, a plural country where the distribution of the national cake is hinged on unfounded indices. The government via the media has propagated lots of public health measures to contain the challenge of covid-19 (Lobato 2020) but these measures remain incomplete and ineffective if the economic base of the people is not taken care of. Hence, public health measures must be combined with economic efforts to prevent the pandemic from destroying the society's poorest and most vulnerable people through what this study calls *hungerdemic.* Sound governance must show commitment at critical periods in a nation's experiences like this and fight for adequate and effective measures for curbing the pandemic without drifting away millions of families to their untimely death and grief. Summarizing the influence of poverty in realizing the fight against covid-19, Citizen online (2020, 1) writes:

> The Senate on Tuesday reviewed the nation's fight against the covid-19 pandemic and submitted that the European style adopted by the Presidential Task Force (PTF), which is coordinating the exercise was killing Nigeria's economy. . . poverty was the strongest weapon used in Nigeria to fight the pandemic

## Conclusion

From the fore-going discussion, it could be gleaned that the distribution of palliative during the corona virus pandemic in Nigeria was a pure silhouette of poor governance. The media, both mainstream and the social media, have played active role in informing and misinforming the Nigeria populace. Some of these media outlets are active instruments in the hands of the ruling class who end up projecting and protecting the activities of the governing class irrespective of the damning effect on the vulnerable masses. The indices for ascertaining the vulnerable for covid-19 palliative distributions were very ridiculous as the country could not boast of a strong data base to ensure equitable and even distribution of palliative materials. Worse still, the materials were so hijacked by the rich who were meant to deliver them to the poor. This in particular x-rays the unpreparedness of Nigeria in the face of emergencies, hence an outright negation of sound governance.

# Media and Crisis Management

Tham T. Nguyen
Gaylord College of Journalism and Mass Communication, University of Oklahoma, Norman, OK, USA

## Synonyms

Disaster management; Journalism; Mass communication; Mass media; News media

## Definition

The term *media* refers to collective mass communication outlets or channels, which produce, deliver, and store information, data, or news products. News products are the result of a journalistic process of gathering, assessing, creating, and disseminating news via mass media for the general public or target audiences. A news report attributed to an author can take on myriad forms (i.e., written, audio, and visual). News products can be disseminated either through traditional media or digital media or both. Traditional media includes print media, such as newspapers and magazines, as well as broadcast media such as radio and television. Digital media consists of news websites, news blogs, and news applications.

## Introduction

Media and crisis management have a complex and multidimensional relationship (Quarantelli 1996). Media coverage in a crisis situation plays a significant role in affecting individuals' perception of crisis management efforts. Thus, an organization needs to understand how news media work to develop crisis responses and disseminate key messages to target audiences.

Disaster management consists of four phases, including mitigation, preparedness, response, and recovery (Quarantelli 1999). The mitigation phase measures the possible impact of potential disasters (usually before actual ones occur) so as to prevent or reduce potential negative consequences. Disaster management teams need to implement long-term programs to encourage environmental friendly activities through educational programs or land use regulations. Disaster preparedness includes actions planned and executed to prepare for disasters that are likely to occur. Disseminating warnings and implementing evacuations are two important actions during the preparation phase. The response phase consists of crisis responses during and in the aftermath of a disaster event. Public safety is the priority concern during this phase. Possible actions include search and rescue as well as providing emergency medical services or essential items for survivors. The recovery phase attempts to rebuild and restore functional facilities undertaken after the crisis response phase is over. The recovery phase also concerns financial loss and reputational loss of locations affected by a disaster. Once public safety is guaranteed, rebuilding efforts can subsequently provide financial support at a basic level.

## Differences in Media Coverage

Disaster coverage varies in the patterns and depth of news stories among mass media organizations. Also, not all media organizations cover disaster events, instead they maintain their routine topics (i.e., specialized newspapers or magazines). In the wake of severe disasters, mass media organizations, especially middle-sized media outlets, tend to change their formal structures, division of labor, or routine programs to report disaster events.

*Print Media* versus *Broadcast Media.* Media organizations are different in the gatekeeping process as well as the frequency of news reporting during a disaster event. Possessing technological apparatuses, such as radio, television, as well as online newspapers, allows for instant media coverage. The television and the radio often abide by broadcast times and schedules. Whereas TV news can visually depict disaster images, especially images of victims, to attract the viewers' attention, the radio conveys the immediacy of events by using short reports. The radio can gather disaster information from authorities to swiftly disseminate warning messages by abruptly interrupting its current program. In contrast, the print media does not have a specific time frame to report the news. News stories published by print newspapers can provide background material and analytical coverage in the postimpact period and rarely include the transmitting of personal messages to readers in the wake of a disaster (Quarantelli 1996).

*Local Media* versus *National Media.* Local media organizations focus on the detailed consequences of a disaster and establish good relationships with local authorities, when contrasted with the outside media. Good relationships with local authorities allow local reporters to obtain information swiftly and in a straightforward manner. Local media organizations consider disasters, which occur in their own communities, important. Field reporters are perceived to have more autonomy than usual when covering disaster-related stories (Quarantelli 1996). Thus, local media organizations can produce exclusive news stories and extensive media coverage on disasters in their own communities.

Meanwhile, the national media aims to report general information during and in the immediate aftermath of a disaster, as well as challenge authorities with tough questions regarding disaster responses and, possibly, cause disaster myths. Moreover, any national media that attempts to gain greater control of their news with the purpose of providing a good story for viewers might produce greater inaccuracy during its reporting (Fischer 1996). To reduce inaccurate news reporting, the national media tends to rely on local sources of information about the disaster in their communities (Quarantelli 1996). The national media is able to obtain more information from citizen sources than it previously could. Videos, pictures, or information posted on residents' social media can become news stories published by the traditional media. Reporters also develop stories based on the perspectives of those who are able to maintain contact with them.

## Media and Crisis Management

Typically, the media plays a dual role in disaster management, reporting what is happening on the one hand and delivering warning messages on the other (Quarantelli 1999). The media's first role is to perform the function of reporting as an outsider, and its second role is to serve as an integral part of the emergency preparation system. Also, the level of media coverage varies during different phases of a disaster incident.

Mitigation activities do not gain much attention from the media. The media has their own methods of reporting the news to attract their audiences' attention. Interesting or shocking news can attract viewers' attention as well as touch human emotion. Also, not everyone has a long-term view of the future with regard to potential risks for the environment, which are caused by people (i.e., landslide, fossil fuel burning) (Quarantelli 1999). Hence, although disasters can have a high impact, mitigation efforts do not yield sufficient media attention. Media coverage intensifies in the prevention phase, when the probability of a disaster transpiring is high. The media reports news when tracking potential disasters and involved in

emergency responses by disseminating warning messages, disaster preparedness, and even evacuation orders from governmental bodies.

In the prevention stage, crisis management needs to understand how people process information from warning messages transmitted through different sources. The individuals' perception is principally based on message sources, media channels, and message features (Quarantelli 1990). First, people are more likely to believe warning messages through the mass media, which are delivered officially by governmental bodies, rather than member of groups or private citizens. Second, the degrees of credibility are different among mass media sources within a community. People tend to search for disaster warnings from channels that they perceive to be credible. Traditionally, the radio plays an important role in transmitting warnings about potential disasters. People are more likely to believe warning messages when they are propagated by multiple sources, both formal and informal, through mass media and personal information networks. Finally, the consistency, context, and content of the message itself can affect the individuals' perception. The more consistent warning messages are, the more likely people will believe them. A detailed warning message is perceived to be more credible than a general warning message. The context of message delivery is important in enhancing the public's belief of a potential danger. A broadcasting station that ceases its standard programming to completely and immediately broadcast emergency messages is trusted far more by their audiences (Quarantelli 1990). Yet, if a warning message is transmitted by shortly interrupting a current program, people tend to perceive it as an indication of something being wrong, rather than a genuine urge for them to respond to the warning (Quarantelli 1990). Thus, a warning message should transmit prompt concerns of a potential disaster and encourage citizen involvement (Dynes 1998). In other words, the media plays an important role in defining a disaster situation and calling for actions to prevent or mitigate human and financial lost (Rosenthal 1998).

During the response phase, the media serves as a proxy for societal attention to any disasters. Yet, incomplete news reports can lead to an unbalanced picture of what follows in the wake of a disaster event. For example, media reports tend to focus on gathering news from formal and organized search and rescue groups, while many of these efforts are informally undertaken by local people helping one another. Besides, social media has become a prominent topic in traditional media to uncover the power of social media in changing disaster responses.

In the recovery period, disaster responses require an understanding of media coverage and its impacts on public perception regarding damaged locations. Media coverage can influence individuals' risk perception with regard to certain locations. News media tend to focus on conflicting aspects and atypical problems, such as damages and rescue efforts (Quarantelli 1996). Negative news stories can make a location appear more perilous than it really is. Misleading media coverage tends to exaggerate and misconceive the potential risks in a certain location as well as fuel anxieties of potential visitors. On the other hand, positive destination images disseminated by the media can increase visitation. Thus, the accuracy of media coverage is essential in shaping a potential visitors' perception of a given destination. Misleading media coverage can affect recovery efforts, such as the restoring of businesses and the tourist industry.

Crisis management implemented by government bodies and community leaders should have a plan to communicate with the media to provide follow-up information of the recovery process. By doing this, crisis responses can reduce the secondary impact after a disaster incident that precipitates media coverage. The media tends to exaggerate the severity of the situation with shocking news so as to attract its audiences' attention, instead of reporting on multiple aspects of the incident. Consequently, media coverage indirectly diminishes the willingness of individuals to travel to a given place and intensifies the economic challenges, which the disaster recovery efforts are attempting to overcome.

Crisis management must develop a contingency plan to lessen the impact of disasters through mitigation and preparation as well as to better respond to a crisis. Crisis management

needs to identify ways to respond to both the reality and perception of a crisis, anticipate scenarios that constitute a crisis in order to execute response mechanisms, and communicate properly at different phases of an emergency situation. Ideally, crisis management should make the media a part of disaster management planning and involve the media in their rehearsal activities. Once the media knows more about the disaster management plan, news reporting will be more informed and accurate. By doing this, the crisis management team can inform the public what needs to be done and is being done. This process enables the team to provide accurate information in a timely manner as well as dispel rumors.

## The Impact of Media in Crisis Management

Media coverage can cause a certain positive or negative impact on disaster responders, decision-makers, authorities, communities, and the general publics.

*Positive Impact.* The news media plays an important role in providing public services related to disaster management such as broadcasting alerts, warnings, and advisories. During the prevention, response, and recovery phases, the media delivers messages and directions to local communities. Also, media coverage of the consequences of a disaster can stimulate donations and volunteerism. On the other hand, they play a helpful role in transferring needed information to decision-makers in disaster responses. By reporting news at damaged locations, the media depicts reality and provides some information for measuring the effectiveness of disaster responses in addition to suggestive improvements for subsequent disaster preparedness plans.

*Negative Impact.* The media is blamed for misleading public opinion concerning the severity of disasters as well as contributing to the politicization of disaster and crisis management. Selective news reporting occurs when some activities received extensive media coverage, while others gain little treatment. Emergency responses from formal organizations are more often depicted than informal emergent groups and volunteers, who are not part of the traditional news set. Bias in reporting also occurs when the media obtains information from community officials at the command post of an emergency operations center (Quarantelli 1996). Thus, providing balance views from some citizen-generated content is crucial.

Media organizations tend to focus on stories that appear stressful to local residents, as well as controversial or provocative ones to gain its audiences' attention. Negative news stories formulate perpetuated myths, most notably that the local residents are always frightened; disasters affect entire communities, mass shelter utilizations, mass evacuations, victim helplessness, and a high probability of crime and lawlessness throughout the damaged locations. Consequently, people may assume that affected communities need all kinds of goods and services. Thus, disaster response teams may receive unneeded and unwelcome donations (Federal Emergency Management Agency 1999).

On the other hand, the media can be aggressive in gathering information and tends to create news stories in a framing and blaming context (Rosenthal 1998). Critical media coverage can put pressure on crisis managers, decision-makers, and political authorities by questioning the justification of their disaster responses or stating incisive concerns about possible causes of deficient emergency operations and litigation procedures. Hence, it requires the authorities to maintain their public appearance until the crisis is over. Also, news media bear the "freedom of press" and are not obligated to report or give information as requested by any governmental bodies. Critical media coverage can cause stress to crisis responders, interfere or complicate the work of an emergency responder, stimulate political opponents to criticize each other, or attribute responsibility or blame someone for failure to respond to a disaster incident (Federal Emergency Management Agency 1999).

## Implications for Policy Makers and Crisis Managers

Media coverage can influence an individuals' perception on public officials' disaster management.

Critical media coverage consists of media scrutiny of emergency management personnel's actions, while the rescue efforts focus on saving lives and protecting property. Responding to a crisis requires public officials to identify public safety as a primary concern and appear to be responsive and sympathetic to victims. National coverage of local events that illuminates the repercussions of disasters can motivate national and state leaders to respond to the event even when local authorities have not filed a request.

Media coverage can have both positive and negative impact on crisis response efforts. On the one hand, news reporting provides information that may motivate political leaders and public officials to investigate any incompetence, mismanagement, or wrongdoings during disaster responses. On the other hand, newsgathering and investigative reporting search for stories or videos of strong human interests. As a result, the media not only conveys urgency, immediacy, and danger in disaster events but also covers controversial issues among or between public officials. Consequently, media coverage of disaster responses can shift toward debates among public officials and divert the focus away from disaster relief.

# Mediation in Public Administration

Amanda Swartzendruber
Illinois State University, Normal, IL, USA

## Synonyms

Alternative dispute resolution; Conflict resolution; Negotiation

## Introduction

Public administration in the United States is moving toward efficiency and transparency. One straightforward approach touted to aid transparency is to increase community involvement in the government. Alternative dispute resolution (ADR) aids in efficiency as it aims to settle disputes without litigation via negotiation, arbitration, or mediation. Mediation allows for public mediators to hail from a variety of backgrounds including counselors, attorneys, advocates, planners, and public administrators. This affords numerous opportunities for community contribution from a vast spectrum of individuals while reducing the caseload of the local court. Mediation is defined as a process where a neutral third party guides disputing parties through negotiation in a safe environment, listens impartially, does not pass judgment, and allows parties to reach a

mutually acceptable solution. Mediation in public matters can be quite effective. If disputants are interdependent, a mediator can find common ground and allow citizens, business leaders, and activists to utilize a safe process to share views, unite goals, and discover agreeable solutions to concerns in their own communities. This is especially helpful when there is a history of dissension between groups. The presence of an outsider with knowledge and beneficial qualifications can ease tensions and allow for progress. In the case where a perception of bias exists with a politician, for example, a mediator can bring legitimacy to the situation. In the occasion a satisfactory solution cannot be reached, the mediator takes on some accountability for the decision. This can assuage some protracted animosity between parties. Mediation as a form of ADR has played an integral part in several major multifaceted events in industry, civil rights, and government over the course of the US history.

## A History of Mediation in US Public Administration

Mediation in US public administration began with labor issues. When unions first formed, common law deemed them illegal labor monopolies. Court injunctions were utilized to break strikes. The legalization of unionization and collective bargaining led to mediation's move to the preferred method for conflict resolution between management and labor. The American Arbitration Association was established in 1926 to offer dispute resolution to avoid civil court; today it operates as a not-for-profit in the ADR field. The National Mediation Board was created in 1934 to tackle issues with labor in the railroad and airline industries and continues to offer statutory mediation, grievance arbitration, and voluntary ADR services such as training, online dispute resolution, and grievance mediation (National Mediation Board 2016). In 1947, the Federal Mediation and Conciliation Service (FMCS) was established with an expanded focus on other areas of labor. This independent agency works with labor and management within government agencies, industry, and local communities (Federal Mediation and Conciliation Service 2016). Over time, the courts legitimized ADR. In 1960, the US Supreme Court handed down three rulings referred to as "The Steelworkers Trilogy" that impacted the legality of ADR methods when it fully legitimatized the arbitration process and limited court involvement by giving deference to the arbitrator's decision (Hodges 1990). The court made it almost impossible to successfully challenge adverse arbitration results in federal courts (Gregory et al. 2010).

Efforts to implement ADR methods aimed to reduce the inefficiency of the judiciary, offer most appropriate processes for each type of case, increase accessibility for citizens and save money for all involved. In 1964, the Civil Rights Act established the Community Relations Service (CRS) to offer nonviolent conflict resolution. It is an agency which works with the government, private and public organizations, and community activists/citizens to tackle issues related to race, disability, religion, gender identity, and sexual orientation (Community Relations Services 2016). Findings by the presidential Commission on Law Enforcement and the Administration of Justice in 1965 illustrated a definitive need to unburden the court system (National Mediation Board 2016). The late 60s saw mediation become a real viable alternative to litigation. The concerns which existed in urban areas spurred an activist response which came in the form of community-focused centers.

In 1969, one such center, the Philadelphia Municipal Court Arbitration Tribunal, developed by the Philadelphia Municipal Court, the Philadelphia District Attorney, and the American Arbitration Association offers disputants binding arbitration (McGillis 1997). In 1971, the Columbus Night Prosecutor's Program used law professors and students to utilize 30-min time slots to mediate cases. These two programs were replicated all over the country (McGillis 1997). The 70s saw an upsurge in mediation as these Neighborhood Justice Centers (NJCs) began to offer cheap or free mediation to resolve minor community disputes. Communities envisioned them as a way to invite citizen participation in the

prevention of and intervention in conflict. The hope was to return power to the people, encourage socialization in the neighborhood, and increase involvement in community development. The courts began to favor this type of ADR because it lessened their load and it served underrepresented disputants and low-income citizens who could not afford a lawyer.

The Federal Mediation and Civil Services Office of Arbitration Services was created in 1973 as well as an advisory committee of 12 labor relations experts and arbitrators to advise on procedures and policies. Also in 1973, the Rochester American Arbitration Association Community Dispute Service Project was created to address racial conflicts in its population. They handled everything from interpersonal criminal matters to city regulations and bad checks (McGillis, Neighborhood Justice Centers and the Mediation of Housing Related Disputes 1979). In 1975 both the Institute for Mediation and Conflict Resolution in Manhattan and the Miami Citizen Dispute Settlement Programs began to offer ADR in their respective cities (Federal Mediation and Conciliation Service 2016).

FMCS officially began to provide ADR in 1975 when Congress passed Public Law 93–531. This required the agency to appoint a mediator to facilitate land negotiations with the Hopi and Navajo Tribes. This is often referred to as the "healing case" by those in the government and the "Relocation Act" by Native American advocates. The mediator was required to instruct each tribe to create a team of five to negotiate, facilitate meetings on a specific timeline, enforce provisions put in place should either team be uncooperative, and have a solution by a deadline or, if not met, provide a recommended settlement to the district court to make a final determination (Congress 1974). The mediation resulted in over 900,000 acres of land going to the Hopis with 1.8 million acres overall divided equally with the Navajo tribe (Yazzie, et al. 2012).

In 1976, the National Conference on the Causes of Popular Dissatisfaction with the Administration of Justice, also known as the Pound Conference, introduced Professor Frank Sander's multi-door courthouse or Dispute Resolution Center idea. He described a method of directing cases filed in court to other options which best address the specific dispute. These options include case evaluation, arbitration, continuation of litigation, early neutral evaluation, and court-annexed mediation. Agents work to direct disputants toward the proper alternative dispute program which helps to streamline processes in court and possibly avoid litigation. The question remained how best to implement these options in communities.

In 1977 the Law Enforcement Assistance Administration (LEAA) of the US Department of Justice published a report entitled "Neighborhood Justice Centers: An Analysis of Potential Models" which reviewed operating programs and then funded three test centers which they studied. They found staff in the operating programs varied anywhere from 4 to 10 employees, cases totaled anywhere from 350 to over 4000, and resolution was found in 90% of cases (McGillis and Mullen, Neighborhood Justice Centers – An Analysis of Potential Models 1977). In 1978 Neighborhood Justice Centers were established in Atlanta, Kansas City, and Los Angeles after a year of planning so they could be studied for best practices. The LEAA identified suitable sponsoring agencies, assisted in developing programs, grant preparation, and award distribution, and hired project directors. They then trained the directors who assisted in staff selection and training and mediator selection and training. In 1979 the LEAA published an Interim Evaluation Report which found it would not work to create a universal model due to complications with individual community needs, resources, and neighborhood perceptions of law enforcement (Sheppard et al. 1979). The centers were more successful if they were tailored to their respective communities and worked into existing service frameworks.

By 1985 there were over 170 programs and support continued to come (Federal Mediation and Conciliation Service 2016). The Civil Service Reform Act of 1990, the Administrative Dispute Resolution Act of 1990, and the Negotiated Rulemaking Act of 1990 directly stated alternative strategies to resolution of administrative

disputes should be implemented by federal and state agencies and departments. In 1993 California passed the Civil Action Mediation Act which established a pilot mediation program for Los Angeles County. It defined mediation as a process where a neutral party facilitates communication between disputants to assist them in reaching a mutually acceptable agreement, and this act remains the statutory basis for mediation programs. By 1995, there were approximately 300 community mediation centers (Federal Mediation and Conciliation Service 2016). This number has continued to grow. The National Association for Community Mediation estimates there are now over 650 centers who hear over 50,000 cases annually (National Association for Community Mediation 2016).

## Mediation in Twenty-First-Century Public Administration

A number of states have adopted the Uniform Mediation Act which provided express authority for the government to utilize mediation (Illinois General Assembly 2004). There are also numerous specific laws in place which allow state agencies to use mediation in certain cases. The National Association for Community Mediation has determined today's community mediation centers should be nonprofit or public agencies with governing/advisory boards who offer alternatives to the judicial system in all stages of conflict, encourage a diverse group of people from the community to volunteer in mediation services without requiring them to have specific credentials, and affect change by offering access to the public without regard to the ability to pay and with consideration for language differences, physical needs, and cultural identities (National Association for Community Mediation 2016). Mediation creates decisions which allow participants to better understand the logic behind how they are reached and help them find justice in unique ways.

A variety of cities now have community mediation programs. One current example, the Community Mediation Center (CMC) of Knoxville, Tennessee, has existed since 1994 and helped thousands. It provides an illustration of the types of programs currently offered from these mediation operations. Court-based programs offered by the CMC include Knox County General Sessions Mediation in civil court which is facilitated by volunteers trained at the CMC. For example, if there is a landlord and tenant dispute or a property dispute between an unmarried couple or roommates, they can sue. In these instances, the people determine the outcome of the case themselves, privately, in a straightforward way and with several legal options (Community Mediation Center 2016). In criminal court, the district attorney can choose to utilize mediation before or after a warrant is issued. These cases tend to be assault, theft, or harassment between people who know each other like former spouses or roommates. In juvenile court, mediation is used in age-related offenses like smoking and truancy, in parenting and visitation cases, and in cases involving children being placed into foster care (Community Mediation Center 2016). Mediation is also used in divorce cases, divorce parenting cases, and domestic violence cases. There are also several non-court programs which use the CMC. These include parent visitation cases, mediation within nonprofit organizations and small businesses, mediation between organizations and small businesses, neighborhood disputes like noise complaints, peer mediation training for schools, and elder care problems (Community Mediation Center 2016).

All federal agencies are required to utilize ADR. For example, the Alternative Dispute Resolution Division is housed within the Departmental Appeals Board of the Department of Health and Human Services (HHS). They oversee mediation in federal cases involving everything from workplace disputes and Equal Employment Opportunity complaints to civil enforcement actions (Department of Health and Human Services 2016). Mediation is also used in the public school system, for example, when parents and teachers disagree over an Individualized Educational Program (IEP). A mediator can work with the two groups to discuss a best course of action for the child's needs. Within the public workplace, mediation may be used by

human resources departments to assist with employers' sensitivity to employee issues, open communication between management and employees, and allow management to proactively address conflict. State environmental agencies utilize mediation for land use disputes. The United States Postal Service utilizes REDRESS mediation which is a program created in 1994 to offer workplace mediation as a test in three Florida locations; today all US Postal workers have access to this service (USPS 2016). It tracks user satisfaction and combines conflict resolution with training to use mediation to improve the workplace as opposed to simply resolving specific disputes (USPS 2016). The Department of Justice utilizes the American with Disabilities Act Mediation Program to refer disputes to mediators with no charge to the disputants (Department of Justice Civil Rights Division 2016). The American Arbitration Association (AAA) was designated by the Congress to assist with over 1500 disputes resulting from the bankruptcy and reorganization of General Motors and Chrysler and has worked via federal statute to settle disputes between sports organizations and the US Olympic Committee and worked with the governments of Louisiana and Mississippi after Hurricanes Katrina and Rita to resolve claims disputes and with the state of North Carolina to offer a statewide disaster mediation program. The federal government also legislates the use of the American Arbitration Association to solve conflicts between private parties (American Arbitration Association 2016). The Financial Industry Regulatory Authority utilizes mediation to resolve security-related disputes between investors, brokerage firms, and individual brokers (Financial Industry Regulatory Authority 2016). Simple discussion of modern-day mediation in the public sphere is difficult because it can include everything from peer mediation to collaborative governments and continues to expand into other areas.

## Conclusion

Mediation can be an effective form of alternative dispute resolution in so many areas in part because it allows all parties to have input. In public administration, this is particularly beneficial as the process can aid in improving relations between government and the constituency by giving people a voice and empowering them through a collaborative process. It is cost saving both in dollars saved by avoiding litigation and in limiting friction and stress which can come with a more adversarial approach to managing conflict. Mediation in public administration will most likely continue to grow in popular use. As the cost of litigation increases, technological innovations like web-based mediation and new areas like foreclosure mediation programs further expand the field. Mediation is now utilized to assist with elder care issues by allowing adult children to resolve conflicts with aging parents and make care decisions. Law firms have added ADR departments to their offices, the government continues to use ADR to handle external and internal disputes, the courts continue to encourage ADR to avoid trials, and the Internet has allowed organizations and individuals to connect and share knowledge. Efforts are being made to standardize mediator training and credentials. In 2012 the Mediation Committee of the American Bar Association's Section of Dispute Resolution offered guidelines for a credentialing program, but currently each state has varying requirements for mediators. Many in the field discuss legitimizing mediation through training requirements with care to avoid alienating possible future participants by making the process too similar to adjudication. Scores of practitioners and scholars are offering training, mentoring, attending/hosting conferences, publishing books, articles and webinars specifically on mediation styles, the need for regulation, and possible additional future uses for mediation. Universities and colleges now offer conflict resolution certificates and degree programs in various departments from law to communication. As long as conflict exists, so too will the need for mediation in all its many forms.

# Merit-Based Pay in the Public Sector: Unwillingness to Abandon the Concept

Gurmeet Singh[1], Neale Slack[2] and Shavneet Sharma[1]
[1]School of Business and Management, The University of the South Pacific, Suva, Fiji
[2]Ex-academic of Fiji National University and is now an independent researcher, Sydney, Australia

## Synonyms

Incentive management; Managing pay; Pay for performance; Reward management

## Brief Definitions

*Merit* – being worthy of praise or reward.

*Merit-based pay* – a compensation system that links an individual's salary to an evaluation of their performance.

*Pay* – the act of being paid a wage or salary.

*Performance* – accomplishment of work.

*Public sector* – government and all publicly controlled or funded entities that deliver public programs, goods or services.

## Introduction

For decades governments have been battling budgetary constraints and citizen's perceptions that public servants were under-worked and overpaid, while attempting to seek out and implement practical strategies that would generate evident

improvement in public service performance. Against this backdrop, and with an ever-changing and globalized world where public servants are no longer contracted for life, and governments compete with the private sector to recruit from a limited pool of high performing human resources, the question of how to suitably reward public servants once recruited remains somewhat unanswered and an overwhelming challenge. A proposed solution adopted in various sections of the public sector "is to replace or complement the traditional civil service system of automatic salary increases based on length of service with financial reward for good performance." Such an approach where pay is conditional on performance is commonly referred to as "merit-based pay" or "performance-related pay" and has increasingly been adopted by developed and developing nations' governments (OECD 2005, p. 1). For clarity sake, in this chapter we will use the term merit-based pay ("MBP").

The notion that public servants should be paid based on their work performance seems logical, forms part of MBP systems, and is founded on an evaluation of individual employee achievements and apportionment of financial rewards to the most productive. While the origins of this concept are traced back to the late nineteenth and twentieth century, by the 1940s MBP was broadly accepted in the private sector as a means of rewarding outstanding employees. By the 1980s, MBP systems were also being adopted in the public sector. After four decades of public sector experience with MBP systems, growing consensus among researchers, academics, and government administrators is that these systems have failed to achieve the desired outcomes such as improved employee performance and productivity, job satisfaction, and reduced employee turnover. Nevertheless, the practice continues despite evidence to the contrary (Hawke 2012, p. 19). Governments continue to openly support the MBP concept and "seem unwilling to abandon the concept" (Kellough and Lu 1993, pp. 45, 46).

## Theoretical Underpinnings of Merit-Based Pay

An ongoing belief is that the public sector needs to be more business-like in the way in which it is operated (Dart 2004). Hence, public sector reform has been characterized by the introduction of management practices and techniques derived from the business sector. A case in point is the introduction of MBP systems in the public sector (Swiss 2005). MBP systems focus on the creation of a clear relationship between employee effort and financial incentives. These systems are suggested to be grounded in the expectancy theory, goal-setting theory, and equity theory, with financial incentives intended to sufficiently motivate employees to produce the desired high-performance outcomes (Choi and Whitford 2017). The expectancy theory assumes that employees understand the performance goals and believe they have the required skills to achieve those goals; employees believe that if they perform to the standard as specified in the goals, their performance would be rewarded; and performance rewards would be sufficiently significant as to justify the required additional effort, or workplace behavioral change. The goal-setting theory holds that MBP will improve employee performance, where those goals are clearly defined and challenging, and have been accepted by the employees (O'Donnell and O'Brien 2000). The equity theory maintains that employees evaluate fairness in their relationships with their organizations and employers through a comparison of their perceived inputs (such as applied effort) to their perceived outcomes (such as salary and other benefits) and with the ratios of other employees (Choi and Whitford 2017). Researchers (Green and Heywood 2008) suggest that MBP systems that comply with the foundational assumptions of these theories can motivate employees and improve effort, performance, productivity, and job satisfaction. However, other researchers (Hawke 2012; Kellough et al. 2010; Perry et al. 2009) have established that these ideal assumptions are often not recognizable in the public sector context and contend that MBP systems in the public sector turned out to be abject failures, with no empirical evidence to show that MBP improved motivation and performance in the public sector. Further compounding these disparate viewpoints, Chenhall (2003) suggests that the public sector has specific characteristics which may restrict the naïve adoption of MBP. Bowman

(2010) sums up the status regarding MBP systems in the public sector by stating that in the public sector the linkage between compensation and desired outcomes remains unclear. Despite these opposing viewpoints, mixed findings, and concerns as to whether MBP systems suit the public sector context, these systems remain attractive and continue to be advocated in the public sector as a means of promoting performance improvement (Choi and Whitford 2017).

## Misconception that Pay Motivates

The presumption that pay is foundational to the motivation of public employees is less than conclusive. Researchers suggest that intrinsic rewards such as workplace participation and job enrichment are the main determinants of motivation and job satisfaction rather than monetary compensation. The expectancy theory also recognizes that people differ in what is of importance to them. However, the MBP system fails to take these differences into consideration and merely focuses on providing extrinsic financial incentives (Hawke 2012; Kellough and Lu 1993). It is suggested that individuals with higher levels of intrinsic motivation (motivated to contribute to providing public services for the betterment of society) are attracted to public sector employment and do not require extrinsic incentive systems to direct behavior (Christensen and Wright 2011). However, extrinsic financial incentives forming the basis of MBP systems have the potential of overwhelming and harming the public service intrinsic motivation of these employees, and the employer telegraphing to employees that intrinsic motivation is less important than extrinsic motivation (Prentice et al. 2007).

## Subjective Nature of Performance Evaluations

The subjective nature of the performance appraisal systems linked to MBP systems, in combination with the hierarchical public sector environment, significantly increases the level of managerial discretion, influence and control over employees' work allocation, career progression, and financial compensation and can be problematic in the public sector (Kellough and Lu 1993). Even the best-intentioned performance evaluations are judgmental in nature and presumptive "that the person's inadequate contribution is separable from any systemic origin of poor performance" (Hawke 2012, p. 19). Because people are subjective, the evaluation philosophy, method, and criteria will vary between one rater and another. Also, various factors which are not job-related, such as gender, age, qualifications, physical appearance, etc., influence either favorably or unfavorably rater bias applied to evaluations and outcomes of performance evaluation (Hawke 2012). Politicization of public sector performance appraisals is also possible. Therefore, the public sector has established elaborate procedures to ensure political neutrality of the public administration. Notwithstanding, as a result of the subjective nature of performance appraisal, it could be argued that MBP systems invite political intrusion and create a tension between neutrality and reward for performance (Hawke 2012; Kellough and Lu 1993).

## Specific Characteristics of the Public Sector

Specific characteristics of the public sector are markedly different from the business sector from which MBP systems were derived and have the capacity to negate potential benefits derived from public sector adoption of a MBP system (Chenhall 2003). The public sector is multifaceted, with diverse objectives and priorities that are influenced by issues beyond their control, and which are difficult to define and measure. The public sector also provides community-wide public services to multiple principals, namely, citizens (tax payers) and stakeholders (internal and external of the public sector), each with competing priorities. Further, many public sector tasks are so complex as to require a team of employees to complete (Prentice et al. 2007). These specific characteristics of the public sector make

individual public sector employee task prioritization, performance measurement, attainment, and incentivization extremely difficult (Propper and Wilson 2003).

## Preconditions Required for Successful Merit-Based Pay Implementation

Scholars argue that specific preconditions are required for successful implementation of MBP in the public sector (Choi and Whitford 2017). Preconditions are suggested to include "trust in management, a valid job evaluation system, clear performance factors, consistent and meaningful funding, and accurate personnel appraisal" (Bowman 2010, p. 74). Further, public sector research has identified that performance appraisals, fair recognition of performance, and public sector motivation are strongly associated with job satisfaction (Park and Rainey 2007) and trust, justice, and perceived fairness form crucial connections between financial incentive schemes and behavioral outcomes (Perry et al. 2009). Notwithstanding, Hawke (2012, p. 22) argues that "none of these preconditions can be assured" in the public sector and that fundamental procedural concerns exist regarding MBP systems in the public sector.

## Trust, Perceived Fairness, and Justice Are Central to Merit-Based Pay Systems

The employment relationship is a social and economic exchange between employees and the organization, with management representing the organization in the relationship. "Some suggest that if employees trust management fairly to recognise and reward their contribution, they are more likely to have positive attitudes about their organisations and work" (Choi and Whitford 2017, p. 447). Conversely, where employee's lack trust in the exchange relationship, they can react with dissatisfaction, withdrawal, and counterproductive work behaviors (Cohen-Charash and Spector 2001). Therefore, employee trust and perceptions of fairness and justice are central to successful financial incentive systems such as MBP (Frey et al. 2013), as any reduction in employee perception of fairness and justice relating to rewards distribution may result in distrust of the system, management and organization, and negative behavioral countermeasures taken by employees that adversely affect individual and organizational performance (Salimaki and Jamsen 2010). Cause for concern is that many factors in the public sector (that are beyond the control of individual employees) affect employee performance, perception of fairness and justice, and trust of the performance appraisal and MBP systems, management and the organization and include: managerial hierarchy; unequal power distribution between raters and employees; employee perceptions that performance criteria are imposed, ambiguous, competing, not clearly explained, irrelevant to the work tasks undertaken, and unachievable; and subjectivity, biasness, and discrimination by raters throughout the performance appraisal and rewards distribution processes (Choi and Whitford 2017; O'Donnell and O'Brien 2000).

## Procedural Concerns with Merit-Based Pay Systems

Public sector employees have raised concerns that procedural issues undermine the effective operation of MBP systems in the public sector (Hawke 2012; Choi and Whitford 2017). It is common for MBP systems in the public sector to fail due to the performance appraisal process implemented being dependent on a manager's perception (judgment) of an employee's performance. An absence of objective data and standard criteria for comparing employees, combined with an appraisal system subject to a number of biases, makes it difficult to distinguish between various aspects of individual employees' performance and performing and nonperforming employees and to appropriately distribute MBP rewards. Also, rater leniency in order to avoid conflict and maintain good relations with employees gets the performance appraisals completed, but at the cost of inflated ratings (with employees being rated

higher than their performance actually warrants), therein undermining any true relationship between merit (performance) and pay, and perpetuating a type of automatic pay increase system. Where raters do attempt to establish distinctions in performance between employees, other problems can result. As a result of the evident failings in the performance evaluation system and its application, employees lack confidence in a system that lacks credibility. Exacerbating the lack of confidence and credibility in the appraisal system is that performance raters often lack training in the evaluation of their subordinates, variation exists in the manner in which the appraisals are administered within and across agencies, and a culture supportive for performance evaluation is often not developed. Ultimately, trust is eroded between management and employees, and conflict and dissatisfaction with the appraisal process and the associated MBP system results. Also, employees that received lower performance ratings commonly experience decreased commitment to the organization and alienation in the organization (Hawke 2012; Kellough and Lu 1993).

## Financial Constraints on Merit-Based Pay Systems

Budgetary constraints and reductions resulting from public sector fiscal stress, and specifically imposed on MBP systems, are commonplace. Arbitrary decisions that funding under the MBP system are restricted to the same levels as previous general reward systems, offset arrangements applied whereby funding limitations require that merit increases for some employees must be offset by decreases for others, and the requirement for equity to be maintained across departments and hierarchical levels, severely restrict the opportunity for any tangible benefits to be derived from a MBP system. Considering the obvious financial constraints and potential for antithetical behavioral outcomes such as rater and employee frustration and demotivation, and the resultant adversely impacted performance outcomes, begs the question whether implementation and operation of a MBP system is worth the effort (Hawke 2012; Kellough and Lu 1993).

## Side Effects of Merit-Based Pay Systems

The majority of MBP evaluations in the public sector refer to the USA, UK, Australia, and other OECD countries. These results highlight that despite the attractiveness in principle of rewarding employee good performance, in practice these systems have at best generated limited success and at worst been dismal failures (Cardona 2007). MBP systems in the public sector have also created unintended side effects that have been difficult to address. An inherent problem with incentive payment schemes, and as evident in MBP systems in the public sector, is that they produce an escalation of performance ratings and associated merit payments, which results in increased salary costs. In theory it could be argued that increased salary costs resulting from public sector MBP systems could be offset by corresponding increased productivity, as often is the case in the private sector. However, in actuality measurement of productivity in the public sector is complex and problematic, with some activities conflicting and difficult to measure, and offset of costs often not possible. These systems also require development, implementation and maintenance of sophisticated, bureaucratic, costly, and time- and resource-consuming administrative processes to control, and tie up valuable resources that could otherwise be deployed elsewhere in the organization and put to more productive use.

Where MBP systems are operational, employees often work towards optimizing their own performance regardless of the impact on the system or organization, as evidenced by creative accounting, withholding information, delaying results, and reducing quality at the expense of increased output, etc., which increases individual visibility and control at the expense of cooperation, and misaligns resources with organizational goals. Inappropriate practices relating to perceived absence of procedural fairness and justice, biasness, favoritism, patronage, and subordinate

sycophancy, combined with individual monetary incentivization, are commonplace in MBP systems in the public sector. Under these conditions, side effects proliferate such as conflict among employees; employee demotivation; damage to employee self-image; restriction of employees prepared to work on interdependent tasks; damage to employee morale, teamwork and organizational culture; restriction of output; and decreased performance and service quality (Hawke 2012).

## Unwillingness of the Public Sector to Abandon Merit-Based Pay Systems

The underlying issues relating to MBP systems in the public sector are persistent. Procedural concerns with MBP systems, inherent subjectivity of formal performance appraisal, inadequacy of funding for merit pay, and the potential for use of merit pay as a mechanism for political control (or the illusion of control) remain as undesirable constraints of the MBP compensation system. Despite the MBP system appearing to have failed to achieve its primary objectives, the public sector seems dependent upon, and reluctant to, abandon this system. What then are the reasons for public sector persistence with a failed system? (Hawke 2012; Kellough and Lu 1993).

Due to the enduring negative public perceptions of the public sector, and demands for improved efficiency, transparency, and accountability, the MBP is suggested to be a symbolic response by the government to control the bureaucracy and deemed politically attractive. Hence, MBP has a compelling political argument for its persistence. A perception also endures that the private sector and their management are held in high regard because they know how to run businesses well; therefore, the public sector should imitate the practices of the private sector and be run more like a business. This perception is fundamentally flawed because it ignores the differences between the private and public sectors. Also, it is assumed that the MBP system operated in the private sector is a business management success. Evidence to the contrary in the private sector highlights that MBP system results at best are mixed with some instances of absolute failure. Nevertheless, the perceptions of the private sector and the viewpoints that the public sector should mimic the private sector and implement MBP systems persist. An obvious reason for persistence of MBP systems in the public sector can be explained by the perception that MBP can be used as a control mechanism by management. Simply put, those (management) who control the performance appraisal process also control the rewards distribution and employee behavior and reinforce the bureaucratic hierarchy and power structures. It would be reasonable to suggest that public sector management could be influenced to overlook the inherent failings in the performance appraisal and MBP systems, confident in the expectation that such systems would reinforce their power and control (Hawke 2012; Kellough and Lu 1993).

Finally, MBP systems require considerable "selling" and building of expectations (that these systems have the capacity to increase public sector efficiency, effectiveness, transparency and accountability), in order to gain approval for adoption and funding of such a system. Adoption of MBP systems also requires considerable investment by governments over a number of years, and ongoing training of managers and employees. Considering the enormous sunk costs already incurred by governments relating to MBP systems, an inability to "get the systems working well," desire not to expose dysfunctional systems and organizational consequences of the systems, and the need for bureaucratic and public "face-saving," the public sector continue to be unwilling to abandon the concept (Hawke 2012; Kellough and Lu 1993).

## Conclusion

In theory, MBP systems seem suitable for use in the public sector. However, in practice, MBP systems are challenging to implement and maintain, are founded on flawed performance managements systems which employees perceive as unfair, unjust and not to be trusted, and often produce the opposite results to those expected, such as

employee dissatisfaction and discouragement, and decreased performance output (Hawke 2012, p. 22). Notwithstanding the evident shortcomings in MBP systems, and that these systems for all intents and purposes appear not to have worked very well for the past four decades, governments continue to make MBP systems a central part of their remuneration structures and "seem unwilling to abandon the concept" (Kellough and Lu 1993, pp. 45, 46).

It is suggested that public sector MBP systems need to be redesigned with the direct involvement of management and employees, and based on a well-structured, holistic, transparent, robust, fair, just, and trusted performance management system comprising mutually agreed goal setting, and with regular periodic performance follow-ups between management and employees. Further, considering that many public sector tasks are so complex as to require a team of employees to complete (Prentice et al. 2007), and that the specific characteristics of the public sector operating environment make individual public sector employee task prioritization, performance measurement, attainment, and incentivization extremely difficult (Propper and Wilson 2003), it is further suggested that consideration should be given to adoption of forms of team performance measurement, reward, and recognition.

# Metabolism of Public Organizations

Mario Coccia
CNR – National Research Council of Italy, Torino, Italy
School of Medicine and Yale New Haven Hospital, Yale University, New Haven, CT, USA

## Synonyms

Budget system; Cost analysis; Cost management; Public research labs; R&D Funding

## Definition

Metabolism of public organization is a managerial approach to explain the utilization and transformation of inputs (mainly public funding) to produce and supply products and services in order to reduce costs and increase the efficiency of organizations in competitive markets.

## Introduction

The concept of metabolism, in a broad analogy, can be applied from biology to public management to analyze processes running from inputs to outputs in organizations and explain how public organizations use economic resources provided by governments to produce/supply outputs and services in society. The concept of metabolism is uncommon in the studies of management and a brief background is useful to clarify it. In biology, metabolism indicates chemical processes that, in living organisms, transform food and drink into energy. The concept of metabolism in a context of Generalized Darwinism in science can explain how complex systems – e.g., organizations – function and behave. Metabolism has a vast use in several disciplines, such as industrial ecology, urban geography, economic geography, ecological economics, etc. (Coccia 2018a). Metabolism of public organizations is a new approach for analyzing the use of inputs (e.g., public funding) to support production, operations, and survival of these organizations in turbulent markets. This approach can also detect organizational problems for designing best practices of public management directed to control and improve the allocation of public funding and other inputs for increasing the efficiency of public organizations themselves (Coccia 2018a). Next section presents a theoretical framework of this new approach for cost analysis of public organizations.

## The Metabolism of Public Organizations

This approach can be described for a specific public organization, such as Public Research Organizations (PROs). A public research organization is an institution that combines economic and human resources to generate new knowledge in basic and applied fields of research, scientific breakthroughs and innovative outputs (cf., Coccia 2014, 2018a; Coccia and Wang 2016). Of course, the approach can be generalized for all typologies of public organizations. The concept of metabolism in public research organizations (PROs) has the goal to explain *how* these complex systems use and transform inputs (e.g., public funds) to manage labs, produce and supply scientific and innovative outputs in society (e.g., scientific research and new knowledge, inventions and technological innovations). In particular, the concept of metabolism, applied in public management, considers public research organizations as complex systems of economic and human resources (inputs), and production processes directed to produce/supply products and services in society (Coccia 2001a, 2008a, b; Coccia et al. 2015; cf., Brown and Svenson 1998):

**Metabolism of Public Organizations, Fig. 1** A linear model of the metabolism of public research organizations (PROs)

1. *Inputs:* human resources, equipment, public funding for research, etc.
2. *Production process* transforms inputs into outputs in labs.
3. *Outputs*: publications, software, patents, innovative outputs, etc.

The system of public research organizations is represented in Fig. 1 with a linear model of metabolism.

This approach can identify how public funding for research is used within public research organizations to analyze possible causes of organizational efficiency or inefficiency. Especially, the approach of metabolism here can support managers to analyze costs and design appropriate best practices of R&D management directed to increase efficiency and productivity of public research labs in the presence of scarce economic resources (Coccia 2009, 2016, 2018b).

- Firstly, the preliminary analysis of the metabolism of public organizations is given by descriptive statistics, trends, and bar graphs that represent the arithmetic mean of variables on *y*-axis and inputs (public funding, etc.) on *x*-axis.
- Secondly, the coefficient $M_{it}$ (M = Metabolism) explains the metabolism of public organization *i* over time *t*: it is the ratio of a critical input divided by a source of funding (measured in U$ or €uro for international comparisons, or local currency for domestic comparisons). This coefficient represents a contextual measure in public sector. In particular, the formula of $M_{it}$ for a public organization *i* is given by:

$$M_{it} = \left(\frac{\text{cost of input}}{\text{revenue}}\%\right)_t \quad (1)$$

For instance, considering the cost of personnel in PRO*i*

$$M_{it} = \left(\frac{\text{cost of personnel}}{\text{State subsidy}}\%\right)_t \quad t = time \quad (2)$$

In particular, Eq. (2) indicates the proportion of the cost of an input (personnel) on total revenue; this is a main indicator of the consumption of public funds in PROs for specific inputs. Similar coefficients can be calculated for other inputs divided by revenue of PROs.

- Thirdly, another technique of this approach is the rate of arithmetic growth of main organizational variables, such as revenue (based on state subsidy and public contracts), cost of personnel, and total cost. In particular, if the level of these organizational variables at beginning is $P_a$ and at the end of the period is $P_t$, and the period of time is equal to *t*, the rate of

arithmetic growth $r_a$ of organizational variables is given by:

$$P_t = P_0 + P_0(r_a \cdot t)$$

$$P_t - P_0 = P_0 \ r_a \cdot t$$

and hence

$$r_a = \frac{P_t - P_0}{P_0 \cdot t} = \text{rate of arithmetic growth} \quad (3)$$

## Application: A Case Study of Metabolism within a Large Public Research Body

An application of the approach of metabolism of public organizations is on the largest public research body in Italy: The National Research Council of Italy or Consiglio Nazionale delle Ricerche (in short, CNR) that has an organizational behavior similar to other research institutions in Europe, such as CNRS in France, CSIC in Spain, etc (Coccia 2014). The sources of data are the annual financial statements of the CNR. Results of this approach of metabolism, based on data from income statement of the Italian National Research Council (CNR) over 1997–2015 period, are as follows. Figure 2 shows main components of cost of the CNR; the highest level of cost within this PRO is given by the cost of personnel, followed by cost of service, materials and products, leased assets of third parties. In particular, the cost of personnel is mainly based on salary and social security taxes. Therefore, the analysis here, considering this preliminary result, focuses on critical factor of the cost of personnel to assess the processes of metabolism within this public research organization under study, and as a consequence, its organizational and managerial behavior (cf., Coccia and Rolfo 2010, 2013; Coccia and Cadario 2014; Coccia 2014).

Figure 3 shows that the proportion $M_t$ (Eq. 2) of the cost of personnel on total revenue (state subsidy) within this PRO (i.e., CNR) is growing over time and in 2015, it absorbs more than 65% of total revenue received by government.

Table 1 shows the growth rate of economic factors of the CNR based on Eq. (3). Results indicate, from 1997 to 2015 period, that the cost of personnel has a very high growth rate (167.87), total cost of CNR has a high one (127.44), whereas total revenue (state subsidy) has a lower growth rate: 118.72. This result suggests an

**Metabolism of Public Organizations, Fig. 2** Metabolism of the CNR organization: arithmetic mean of main costs in € (Euro)

**Metabolism of Public Organizations, Fig. 3** Metabolism of the CNR organization: proportion of the cost of personnel (and other costs) on total revenue from 1997 to 2015

**Metabolism of Public Organizations, Table 1** Metabolism of the CNR organization: rate of arithmetic growth of some economic factors based on data from annual income statements

| Rate of arithmetic growth | Total revenue | Cost of personnel | Total cost |
|---|---|---|---|
| $r_a$ (1997–2015) | 118.72 | 167.87 | 127.44 |

imbalance of growth rates between total revenue from governments and vital costs within this PRO. This imbalance of growth rates can be the source of economic issues for this public organization in the course of time.

To sum up, the analysis of the metabolism seems to reveal that this public research organization absorbs a substantial proportion of public funds (state subsidy and public contracts) to cover high costs of personnel over time. Overall, then, the approach of metabolism applied on this research institution suggests possible organizational inefficiencies, driven by high costs of personnel in the long run.

## Conclusion and Public Management Implications

The metabolism of public organization can reveal critical organizational and managerial issues, such as public research organization described above absorbs a high share of the total revenue for the cost of personnel, generating economic problems and several organizational inefficiencies over time. This result is also due to a public research system in Italy that has rigid research organizations to cope with public rules of budget balance that generate cuts of public funding from governments to research organizations (Coccia 2018a). This approach provides main information for public management of the PRO under study that has to control the growth of the cost of personnel in the presence of shrinking public research lab budgets to support efficiency and sustainability of this research body in the long run.

In general, the approach of metabolism, presented here, is critical to cost analysis and management within public organizations. In particular, this approach can support public management that, in the presence of budget cuts, can improve the allocation of resources and the efficiency of public organization by controlling specific costs (e.g., cost of personnel), and by balancing the utilization of public funding between different costs to support the efficiency

of overall public organization over time. Moreover, if public organizations cannot reduce the high cost of personnel in order to increase general productivity, as well as they cannot offer substantial *extrinsic (financial) incentives* because of rigid scheme of salary and scarce public funds, then public management could increase *intrinsic rewards* to support motivation and performance of public organizations (Belle and Cantarelli 2015; Weibel et al. 2010; cf., Benati and Coccia 2018; Coccia and Benati 2018; Coccia 2019). O'Reilly et al. (1991) have suggested that intrinsic rewards may support job involvement and satisfaction of people in organizations (cf., Coccia 2001b). Specifically, intrinsic rewards may support productivity of personnel also in the presence of budget cuts (cf., Coccia 2019). In this context, Crewson (1997, pp. 503–504) argues that: "Intrinsic rewards are more important to public employees than to those employed in the private sector."

Hence, the approach of metabolism proposed here can be a useful managerial technique to analyze costs and design best practices of public management directed to support efficiency of public organizations in turbulent markets.

# Methodology of Theory Building for Public Administration

Hassan Danaeefard
Faculty of Management, Tarbiat Modares University, Tehran, Iran

## Synonyms

Theory construction

## Definition

A theory is one or more hypotheses that temporarily represent, describe, analyze, and explain the behavior of a phenomenon.

## Introduction

Theorists present their theorizing experience in a variety of ways. However, from some theorists' perspectives (Mintzberg 2005), it is impossible to provide an accurate methodology for theorizing. But in recent years, a field called "theory-building research" has emerged that seeks to explore methods of theory-building. It should be noted at the beginning of this essay, the words "theory" and "theory-building" seem vague and sometimes unattractive to many academics (Hatch 1997). The publications about theory-building methodologies infected with ambiguous jargon language have created pessimism and sometimes fear in researchers. Some people think that theorizing is merely the work of scientists, whose primary profession is theoretical knowledge production. The author has studied many books and articles on theory-building in public administration, public policy and management in particular, and the social sciences. It also emphasizes that Mintzberg's theory methodology (2005) and Weick's theory construction approach (1989) are more practical and useful. However, it is necessary to have a comprehensive and systematic methodology that, while being simple and far from the jargon language of some theory-building researchers, shows a kind of order in theorizing and open the black box of the subjectivity of the theorizing process in the approach of Mintzberg (2005) and Weick (1989). By studying the primary methodologies (Dubin 1978; Weick 1989; Lynham 2002; Van de Ven 2007; Carlile and Christensen 2006), the author presents his methodology, which results from his experience. Therefore, this methodology is based on the parts of the above methodologies. The author does not claim comprehensiveness in this regard. Still, he argues that this methodology can foster the audacity of theorizing for experienced researchers and postgraduate and doctoral students.

## What Is a Theory?

There are almost as many definitions of theory as there are people who have talked about theory. Reynolds (1971: 3), for example, sees theory as a set of laws, definitions, axioms, propositions, and descriptions of causal processes. Dubin (1978) considers theory: as a set of causal relationships between variables, as he called units of theory. Gioia and Pitre (1990: 587) describe the theory as a framework for describing, explaining, and representing an observed or experienced

phenomenon. Pedersen (2007) argues that one reason for the ambiguity about theory is the diversity of definitions of theory; therefore, in his article, he tried to enumerate its main components. By analyzing the content of theory definitions, he has determined the four defining elements of the theory: the logical structure, features, parts, and the relationship between theory and research.

Therefore, there are many definitions of the word "theory." "Theories simplify, and by simplification, we [humans] attempt to bring phenomena under a focused lens to see and understand them better. Theories, then, like models, serve to explain and help us understand what happens in our surrounding world. They claim to represent reality or interpret realities, either socially created realities, or as they exist in nature" (Farazmand 2002: 19). "Theories may also be developed through propositions, hypotheses, experimentations, and with empirical studies that produce similar results with consistency over time" (Farazmand 2022, forthcoming). The author finds Mintzberg's (2005) view of theory useful. Mintzberg (2005: 355) argues: "I have no clue how I develop theory. I don't think about it; I just try to do it. In my view, theory is a spectrum that can accommodate different descriptions, explanations, and analyses to varying degrees." By accepting this view, the author defines the theory as follows:

A theory is one or more hypotheses that temporarily represent, describe, analyze, and explain a phenomenon's behavior. So the first point is that theory is always a hypothesis. The second point is that the theory represents the phenomenon; not the phenomenon itself, and description and explanation by a theory are temporary. Third, this definition includes theories from quantitative, qualitative, and mixed-methods research. It also encompasses positivist theories and ranges from ordinary typologies to grand theoretical frameworks. With this definition, the author has presented his theory-building methodology; therefore, based on this definition and the present methodology, we can construct grand theories and middle-range theories (Bourgeois 1979).

## Rationale of New Methodology for Theory-Building

Inspired by Weick's particular approach to theorizing (1989), the author argues that some earlier theory-building methodologies (e.g., Dubin 1978; Lynham 2002; Van de Ven 2007; Carlile and Christensen 2005) put the theorist in methodological strictures. Some of the others (e.g., Weick 1989; Mintzberg 2005) do not articulate the complexities of theorizing and cannot determine the interactions between variables apart from establishing statistical relationships. The complex and technical language of these methodologies creates a fear of theorizing in the theorist. Besides, suppose the theorist is caught in these methodologies' strictures. In that case, he/she is deprived of recognizing and explaining the various aspects of many phenomena that do not fall within these steps' framework. Also, in the author's view, although Weick's (1989) view can address some of the shortcomings of previous methodologies of theorizing, his language is somewhat technical and must be operationalized and taught. Thus, the author tries to simplify these ambiguities in his methodology. On the other hand, the author accepts Mintzberg's (2005) view, who argues that theory should be seen as a spectrum. Accordingly, the author defines the theory as follows:

"A theory is one or more hypothetical propositions that temporarily represent, describe, analyze, and explain the behavior of a phenomenon."

Therefore, the theorist can build different typologies on public administration and public policy, and grand theories by the author's methodology proposed. On the other hand, endorsing Lindblom (1987), the author argues that theorists should not sacrifice creativity, imagination, and originality for validity. Suppose we limit theorizing to the realm of validity. In that case, we will be deprived of knowing many aspects of the phenomenon under study that cannot be understood in a quantitative theory based on provable hypotheses. If a theory catches others' eye, and its theoretical narrative creates in them the belief that it adequately describes, explains, and analyzes the phenomenon's behavior in question, even if it can

be presented in the form of a theory, being a theory it is acceptable. The steps of the author's methodology are described below.

## A General Methodology of Theory-Building

### Understanding an Issue, Problem, or Diagnosing an Anomaly

Most quantitative and qualitative researchers of theory-building research (e.g., Dubin 1978; Freese 1980; Blalock 1969; Lynham 2002; Van de Ven 2007; Whetten 1989) have emphasized that it is the starting point of theory-building to identify a problem. Even Weick (1989), who claims that theorizing is a kind of disciplined imagination, mentions the first element and step of theorizing as a "problem statement." Although the starting point may be the completion of a story (Polanyi 1989), the question (Turner 1987), the strategic research material (Merton 1987), or the scientific anomaly (Schank 1988), in the author's view, the first stage of theory-building has identified an issue or anomaly. Whether the research is theory-based or problem-oriented, the starting point of theorizing can be an issue.

These two elements (issue and anomaly) cover the starting points of all theory-building methodologies of theory researchers; because the issue can be theoretical or practical, and the anomaly can also be theoretical or empirical. Moreover, using the word "problem" in social sciences, which is not pure science, will not be beneficial, although it is common in universities' research methods. Therefore, the term issue seems more appropriate. Although scientific anomaly, in the view of Thomas Kuhn (1962), is relevant only to the theoretical field, the author's view is that the scientific solution of a problem, if over time cannot show its effectiveness, has become a kind of anomaly. Therefore, the first step in theory-building can be to identify an issue or diagnose an anomaly, but understanding an issue or anomaly in a scientific field depends on knowing the phenomenon under study (scientific or theoretical phenomenon), and methodologies and methods of theorizing. A theorist equipped with the power to discern these two theory-building elements is called an expert (Lynham 2002). Accordingly, having expertise (both practical and theoretical) to the appropriate extent is an essential condition for developing a theory. With his/her expertise, when a theorist recognizes an issue or a scientific or practical anomaly, he/she thinks to give it meaning or solve it, which Weick (1989) calls disciplined imagination.

### Perform Scientific Imagination

Lindblom (1987: 512) argues that theorists often write trivial theories because the process of theory construction is hemmed in methodological strictures that favor validation rather than relevance. Relying on Lindblom's assertion, Weick (1989) argues that these methodological strictures undermine the act of theorizing because it diminishes the contribution of imagination, representation, and selection of theorized solutions. It does not pay much attention to the importance of alternative theorizing activities such as mapping the phenomenon's behavior, conceptual development, and speculative thinking (Weick 1989: 516). The author takes Weick's (1989) view as the second step in his proposed theory-building process methodology, arguing that it must have a scientific character when systematic imagination is considered. In the sense that some abstraction process takes place in the theorist's theoretical treasury, it must rely on the induction, deductive, and abductive reasoning. That is, when a person enters the treasury of his/her imagination, he resorts to induction, deduction, and the abduction reasoning process to give meaning to a subject or tiger an initial theory. His/her practical experience helps his/her draw a conclusion based on what he/she has observed in practice and integrate it into a unit. These three processes simultaneously and continuously occur in the theorist's mind, and a kind of intra-mental discourse is continually taking place between them. This imagination may occupy the theorist at work, at home, traveling, or even at rest. In this mind game that operates away from methodological strictures, the theorist builds and destroys his/her theory as a continuous puzzle, increasing and decreasing its element, and relations between; adds or removes margins; but

the theorist performs simultaneously time, scientific imagination. Hence, he/she imagines based on his/her expertise. From the heart of these mental games emerges an "*unexpected raw theory*"; hence, Weick (1989) considers it a thought trial.

### The Emergence of an Unexpected Crude Theory

Weick (1989) relies on evolutionary epistemology, which claims that each phenomenon goes through three stages of evolution: variation, selection, retention, called the second step of his theorizing methodology as the "artificial selection"; but the artificial selection is different from natural selection. According to Darwin's theory of evolution, when a phenomenon emerges, it is selected to adapt to the environment and thus survive. Otherwise, the environment destroys it; because the phenomenon is not compatible with the environment, the environment avoids giving him/her the necessary resources. But in artificial selection, both phenomena and selection criteria are representations (i.e., not real phenomena but their representations). Thus, the imaginary game is played with representations, and the selection of appropriate representations is based on criteria by which, according to Weick (1989), the resulting theory can be complete. Accordingly, Weick (1989) argues that the resulting theory should be "interesting" (Wake inferred this criterion from Davis (1971) as "it's interesting"), believable, and beautiful. Mintzberg (2005) uses the term "surprise" and argues that theory unexpectedly emerges from the theorist's systematic imagination and should surprise others. In other words, a theory must attract others' attention and create a belief that the theorized phenomenon behaves as the theorist theorizes; at the same time, a kind of beauty in the arrangement, relationships, and interactions of the theory evokes in the mind of the reader. But when the theorist's unexpected theory is formed, it must be judged by others.

### Preliminary Judgment of Raw Theory

The theory is formed in the emerged imagination, but it also has Dubin's characteristics (1978). Dubin (1978), in his two-part model (conceptual and empirical formulation of theory), claims that each theory is formed of units that are governed by a kind of rules of interaction and have certain boundaries. According to the units and the type of management of interaction between them, different system states emerge. Propositions are extracted from different states of the system, and then hypotheses are formulated based on them and tested according to empirical criteria. According to the author, at this stage, the theorist presents his/her initial theory in scientific circles (e.g., theorizing meetings, national and international conferences, and specialized roundtables). Feedback and critiques of the theory lead to the refinement of the units of theory and the laws of interaction that govern them and the system's states that govern the theory. But not all theories in the style of positivism will have precise boundaries; if they take such a form, they will lose their philosophical element (Agamben 2009) that will cause their expansion. This step creates relatively clear boundaries for the theory. By applying views, critiques, and suggestions to modify the raw theory, the theorist enters the next stage of theorizing, the formation of enriched theory.

### Articulation of a Rich Theory

The result of presenting raw theory in various circles (from friendly scientific meetings to student classrooms and regional, national, and international circles and theorizing meetings) is to find the gaps and weaknesses of raw theory with the theorist's help. It can solidify its theory and offer an enriched theory. At this step, the theorist may examine the units of theory, the laws of interaction between them, and the states of the theory system, and conclude his/her theory's totality. The theorist now puts his/her theory to the test. Another step might be to publish it in the form of an article or a book.

### Testing Enriched Theory

In the author's view, a theory is a continuum that may be a list of several variables to a grand theory that explains the behavior of a wide range phenomenon at one end of the spectrum. Therefore, at this step, some theories need to be tested on the subjects through various tools to determine the validity of the relationships and rules, as well as

the system states of the theory. In other words, the chance or imaginative nature of the internal interactions of the theory is removed and validated.

### Applying Theory

Experts in a field validate some theories because analysts use those theories to analyze phenomena. In other words, some theories (e.g., Herzberg's theory of motivation) have been and are being used by world leaders when they have been tested. Still, we cannot test the theory of symbolic interaction in the detailed form of a positivist. Scientific circles of the world accept this theory and believe in its practicality (although not everyone may believe so). In other words, when researchers and scholars use a theory to analyze a phenomenon, they are applying it. Thus, when others accept that the real phenomenon in the universe acts on it, some theories' practicality becomes clear.

### Improve Theory

When a theory is accepted in practice, it may develop some anomaly over time. In other words, there may be behavior in the theorized phenomenon that the existing theory cannot explain. In this case, the theory suffers from a lack of explanation. Referring to Porter's theory, for example, Mintzberg (2005) argues that the comparative advantage theory dominated international trade. Still, the behavior of countries such as Japan and Italy created an anomaly in this theory, and Porter proposed the theory of competitive advantage (Mintzberg 2005). Sometimes the theory can remedy anomaly. The theorist improves his/her theory by referring to the previous steps. Sometimes, the current theory cannot explain the behavior of the phenomenon in any way, so it is invalidated, the theorizing steps have to go through (see Fig. 1).

## Conclusion

Doctoral and master's dissertations in the fields of public administration and public policy are deprived of innovation, imagination, and originality by falling into the trap of statistics. It is not uncommon for a student to theorize a merely innovative and creative idea of a phenomenon in the field of public administration or policy-making in his/her dissertation without using statistical techniques and having it accepted by the faculty committee. The student should be allowed to present his creative theory in a narrative rather than merely displaying statistics. According to the author, the methodology proposed in this chapter will help scholars and students to create a variety of typologies, frameworks, and theories by resorting to systematic scientific imagination. This methodology can justify both grand theories and the relationship between two variables. The theory derived from this methodology must have the necessary rationale, and the theorist must have the required expertise to justify the interactions of the elements within his theory. Therefore, any assertion that is disorganized and without substantial support, and lacks rational-logical justification cannot be considered a theory. Mintzberg's typology of organizational structures is a theory, but they have a logical rationale that encourages the reader to believe it. Public-private typology is also a theory, but it is justified; because it tells the reader what a public organization is and what a private organization is. Therefore, not every assertion can be called a theory. This methodology is undoubtedly evolving, and the author does not believe that this framework is final and complete.

The author argues that the initial spark of a theoretical idea or the initial meaning of observation is more valuable than merely testing a theory. This methodology tells the reader that no theory is initially presented in a formula; the theorist must formulate and present his theory's narrative initially; later, some turn its constructs into variables and test it. While having the strengths of these methodologies and avoiding their weaknesses, the author's methodology draws a more realistic theorizing process in the theorist's mind. This methodology does not have

**Methodology of Theory Building for Public Administration, Fig. 1** A general methodology for theory-building

the rigid features of these methodologies. And it agrees with Weick's (1989) viewpoint and Mintzberg's perspective (2005), but the black box makes the last two theorists more transparent. Simultaneously, the theorizing process from the author's point of view is not linear but reciprocal. The dotted lines show these reciprocal states.

City-region governance arrangements; Metropolitan governance tools; Metropolitan integration and plurality; Metropolitan multilevel governance; Urban governance models; Urban territorialism and deterritorialism

## Metropolitan Governance Answers to Problems of Urbanisation

Metropolitan governance arrangements vary based on two factors: (1) governance mechanisms that consist of combinations of hierarchies and networks and (2) the administrative tiers that primarily steer the structure. This article ponders the sources of success and failure of metropolitan governance in the realm of these factors.

Metropolitan areas are becoming more and more important, as larger proportion of people live in cities all around the world. This creates multiple opportunities. Metropolitan areas produce higher GDBs than the states' average. Urban spaces create social and cultural platforms in which new forms of human activity can develop. Dense urban structure can also diminish pollution. Alternatively and simultaneously, urbanization causes problems and challenges. Uncontrolled growth can lead to urban sprawl and social segregation, which can, again, accelerate congestion and worsen the quality of life in metropolitan areas. Metropolitan challenges are thus complex socially and spatially: both prosperity and poverty are nested in metropolitan areas, and metropolitan challenges include issues that cover neighborhood level, but also ones that are connected to global challenges.

Metropolitan governance is about finding and implementing the right means to respond to these challenges. Existing administrative structures can take care of metropolitan governance tasks, or governance arrangements can be established solely for this purpose. The sphere of approaches to metropolitan governance is wide, but there are two significant factors that define the nature of metropolitan governance. These factors are governance tiers and governance mechanisms. A governance tier refers to the level of government that principally coordinates and steers metropolitan governance: local, regional, or national. Governance mechanisms can be divided into those that are based on hierarchical steering and those that rely on networked cooperation.

Every metropolitan governance model, consisting of different mechanisms and tiers, is a result of both active choices and evolutionary incremental change of the administrative systems, their operating environments, and global trends. The actors and institutions that are dominant in metropolitan governance represent different governments or governance tiers. They also use different governance mechanisms to achieve their goals. Metropolitan governance is a practical combination of different tiers and mechanisms, but the governance system in different metropolitan areas often leans toward one end or the other in both factors.

## Metropolitan Governance Tiers

The actors and institutions struggle to define the "best" territorial scale for dealing with contemporary issues. This structural tension is present in both academic and practitioner discussion on rescaling, and it is particularly strong in the case of metropolitan governance for multiple reasons. First, metropolitan governance cannot be easily determined under any of the existing tiers, since the metropolitan issues cover different spatial scales. Second, metropolitan areas hardly ever respect the borders of existing administrative borders. They are in a constant flux, as they grow and change. Third, metropolitan areas also have an increasingly important role in the state economy and as a place of residence for a growing number of people, and therefore the state level is particularly interested in metropolitan areas and their governance.

The relationships between different levels of representative bodies vary across countries and traditions. This variance can be seen in the representative bodies' tasks, funding, jurisdictions, and autonomy. The role of the existing tiers is mainly connected to the role of local government in the country in question. Similar conceptions of local government also follow geographical borders and historical path dependencies. A well-known example of different traditions in local governments is the division to Napoleonic, Anglo-Saxon, and Nordic and Middle-European variant. In the Franco group, the local governments are pronouncedly political, as local communities are expected to stand for local interests against higher levels of government. In the Anglo group, the local governments are highly autonomous, but they have a weak legal status. In the Nordic and Middle-European group, the local level has the strongest status among the tiers. The examples are from Western democracies, but there are surprisingly big differences in the relationships between

administrative tiers among countries that are seemingly similar.

The status of local government is important in shaping metropolitan governance structures. However, even the status of local actors is mainly connected to their relation vis-à-vis the state. Due to the increasing importance of metropolitan areas, their relationship with the central government is particularly noteworthy among central-local relations. The growing significance of metropolitan areas also appears as twofold nature of this relationship. It may give them a special and more autonomous status among cities and regions, but it can also lead to increased control over the area and its governance.

Metropolitan governance structures thus represent the efforts of national and subnational authorities to close the gap between socio-economic areas and administrative jurisdictions. What kind of metropolitan governance structure is established is largely defined by the power relationships between these authorities.

## Metropolitan Governance Mechanisms

Metropolitan governance is organized with different combinations of hierarchies and networks. The essential difference between these mechanisms is how the citizens' voice is heard. Administrative hierarchies that make decisions on public policies are typically based on representative democracy, where hearing the citizens' voice is based on voting. The representatives make decisions on behalf of the represented, and their mandate is given through predefined and trusted elections. Vertical steering and accountability together with clear jurisdictions based on position are considered to guarantee the transparency, openness, and continuity of the decision-making.

Network governance is based on deliberative democracy. Its main idea is that active citizen participation gives decision-making bodies a much wider perspective on the views of the people than a system that is based on representative democracy. Multiple stakeholders take part through various channels continuously, not just in elections. The networks are also considered to be more flexible than hierarchies, since they are able to regenerate themselves. Thus, networks consisting of independent but interdependent actors are seen to reach better solutions for wicked problems in a world that changes at an accelerating pace.

Networked decision-making is, again, criticized by those who emphasize the importance of representative democracy: different channels of participation hinder the transparency of the process and thus diminish democracy. Horizontal accountability can paralyze networks in conflict situations, as no one has power over others. In addition, a structure that is built upon individual qualities is more vulnerable than a structure that is based on position in the structure, which threatens the continuity of the decision-making bodies. Although the premises of the two mechanisms contrast with one another, they are applied together in the practices of different governance structures, including metropolitan governance.

In the context of metropolitan governance, hierarchical steering basically means that there is a governance structure that covers an area that is defined as metropolitan region, and the decision-making of the structure is based on representative democracy. Among other challenges, the problem of hierarchical steering in the context of metropolitan governance is that the areas tend to grow, and the metropolitan governance structure ends up covering only a part of the metropolitan area. Networked structures can either be multiple territorial communities such as decision-making bodies consisting of municipalities or multiple specialized bodies, possibly covering different functional areas. Municipality-based networks have multiple challenges such as different statuses and competition between the municipalities. Functional networks may cover very different areas and be isolated from other decision-making bodies in the same area. This is connected to another challenge: overlapping and unclear jurisdictions of different actors.

## Success and Failure of Metropolitan Governance

Similar structures in their basic features, such as governance mechanisms and tiers, have succeeded in some metropolitan areas and failed in others. There is no simple recipe for establishing a metropolitan arrangement that has the capacity to govern, the ability to construct effective policy, and to participate in multilevel policymaking.

### Context and Legitimacy

The context of the metropolitan governance structure has a big impact on its success or failure. Not only the institutions but also the different types of administrative and governing traditions, political history, and administrative culture influence which tiers and what kind of combinations of networks and hierarchies are seen as suitable for handling metropolitan-level tasks.

Context creates the invisible framework in which the metropolitan structure can be considered legitimate. Legitimacy, again, is necessary for the governance structure to be able to perform metropolitan governance tasks. Altogether, legitimacy is one of the most significant factors in metropolitan governance arrangements' success, but it does not guarantee it. Fully legitimate structures can end up being more about reproducing legitimate cooperation than about actual governance.

The essence of legitimacy is that the decision-making power is accepted by those who are ruled. What is considered legitimate is connected to the tradition and the relationships between the existing government levels and administrative actors.

When metropolitan governance structures are created in countries, where the local level is strong, the local governments cannot be bypassed. If the local level is nevertheless overridden, fragile legitimacy will likely not be achieved, and the workability of the arrangement is threatened. If the administrative system is highly state-centered, metropolitan governance can also be centralized and steered in a straightforward manner.

Legitimacy is therefore about respecting (national) administrative contexts and their fundaments rather than trying to copy successful models from other metropolitan areas, even if the models are applied in countries with similar administrative premises.

### Legitimacy and Changing Paradigms

The premises of legitimacy change, even though mainly slowly. International trends often appear as theoretical and practical paradigms about governance. These prevailing conceptions about what is important in governance and how capacity can be best achieved effect on what kind of mechanisms and which tiers are even taken under consideration to dominate the metropolitan governance processes.

Metropolitan governance structures, and the way they appear nowadays, are strongly connected to changes in international trends and administrative paradigms, particularly the shift from government to governance. Governance is commonly understood as a shift further from hierarchical structures and toward networked governance structures.

Theoretically, hierarchies and networks have completely different conceptions of what kind of decision-making processes are the most legitimate. Hierarchies rely on input legitimacy, as voting is seen to give the best mandate for representatives. Also, jurisdictions based on position and vertical decision-making structures are considered to guarantee the transparency and reliability of the structure. Networks are based on output legitimacy, as the involvement of various stakeholders is seen to be the best tool to find outcomes. In output legitimacy, the best possible solutions cannot be defined in the input phase or by the representatives alone. Networks' legitimacy as a governance tool is, again, questioned. Networks are seen to be less legitimate, because their decision-making is seen to be less transparent than in hierarchies. Also, networks rely on output legitimacy in theory, but common problem

in networked arrangements is that they are uncapable of solving internal conflicts; why they may actually have challenges is accomplishing visible outputs.

The discussion on regionalism, public choice, new regionalism, and reterritorialization combines the discussion about mechanisms and tiers in metropolitan governance. These paradigms have had their particular golden ages, but they are all still present in discussions about metropolitan governance. Regionalism is the form of metropolitan reform, where the growing metropolitan area and its challenges are attempted to be managed by creating a monocentric and hierarchical metropolitan governance structure with clearly defined area and jurisdictions. Public choice advocates believe that competition between smaller areas, such as local governments, brings the best results. The competition forces the local level actors to keep the taxes low and provide good services to keep their inhabitants and businesses. New regionalism also relies on local governments, but it emphasizes cooperation rather than competition. The best results are seen to be accomplished in networked governance structures of interdependent local actors. Reterritorialization represents a form of regionalism that can be considered even more fundamental in its nature. It is connected to global urbanization, where the competitiveness of nations is created on metropolitan level, thus demanding strong metropolises or megalopolises to compete with other metropolises. Different paradigms fit better in different contexts, but they may also slowly prepare the ground for structures that eventually change the context.

### Cooperation and Continuity

In addition, political power relations affect what is seen realizable and/or desirable under the existing circumstances. Changes in power relations have an influence in establishing and disestablishing metropolitan structures. This means that political power changes can lead to pendular metropolitan reforms: structures that are established under certain political ascendancy can be dissolved in another. In this framework, the success and failure of the structures is connected to wider issues, such as political culture that encourages actor cooperation, trust, and dialogue rather than one that focuses on disrupting the structures that are created by political rivals and creating political cleavages.

# Middle Class Formation in Russia

Svetlana Mareeva
Centre for Stratification Studies, Institute for Social Policy, National Research University Higher School of Economics, Moscow, Russia

## Synonyms

Middle class criteria; Middle class identification; Middle strata; Middle-income groups

## Definition

Middle class – social entity that occupies positions in the middle of social structure sharing common social characteristics; according to different approaches, emphasis may be placed on its structural positions in relations of production (socio-professional and educational specifics), level of welfare/income or shared self-identification.

## Introduction

A period of qualitative changes in Russia has led to the transformation of many social aspects, including the social structure. Unsurprisingly, its specific features and certain social groups and strata are of particular interest at the moment. Both the scientific community and the general public are traditionally interested in the social entity of middle class. Questions are raised whether a middle class even exists in Russia and if it does, it needs to be established what it is like; how it correlates to middle classes of the Western countries; what the specifics of its behavioral practices, norms, and values are; how it interacts with the state; and what chances Russia has to become a "middle-class society."

The interest in the middle class is quite understandable. First of all, it is associated with a number of crucial social functions. It comprises the most productive, highly qualified and educated workforce and ensures its intergenerational reproduction. Characterized by possession of accumulated resources, the middle class is interested in sustaining stability of social, economic, and financial institutions, because it has "something to lose." The middle class is the main consumer on many goods and services markets and can also participate in style consumption due to available financial resources, not limited to sustaining survival standard of living. Furthermore, the middle class is the first social group to proceed to mass consumption of innovation products and services and then convey these practices to other social strata. The middle class is also a major taxpayer and hence the state's co-investor in social services. However, the question remains open whether the current Russian middle class can successfully fulfill all these functions.

In addition, middle class development is closely related to Russia's prospects in the world arena: successful political, social, and cultural processes depend not only on reforms conducted on the macro level but also on the population's ability to support them. In this regard, it is the middle class as a mass social subject that can directly and significantly affect the performance of the nation's economic system, define the quality and quantity of human and innovation potential, and establish behavior patterns for other social groups.

The term "middle class," however, does not have a universal definition. Its meaning has been changing along with the social development and social structure transformations, depending on the historical context of a society. Moreover, several conceptually different approaches to identifying the middle class were emerging separately (due to the fact that middle class analysis was based on different goals and objectives that required different methodologies).

In Russia, there is ongoing theoretical debate over the necessary and sufficient conditions for classifying an individual or a household as middle class. Arguments for existence of the middle class in the country are quite often completely different as a result of diverse approaches and respective criteria, as well as the chosen thresholds, for

identifying the sought-for middle class. Differences in the methodology of middle class identification lead to a considerable spread in the estimates of its share, from 2% to 3% to at least half of the population.

## The History of the Middle Class

In a dictionary of sociology, one may come across a definition of this kind: "middle class is a large group of qualified employees and small and medium business owners who occupy similar positions on the labor market and share labor and market values" (Middle Class 1994); in other words, the emphasis here is placed on the common socioeconomic features of its representatives.

In the analysis of preindustrial and early industrial societies, the middle class was usually viewed as a "residual" social group that included everyone who did not belong to large-scale classes (for instance, townspeople like small merchants and tradesmen who were not gentry or peasants). Consequently, the structure of the middle class as a residual category varied together with the changes in society as a whole, in accordance with a specific historical period.

An interpretation closer to the current definition was developed later. According to some scholars, middle class as a specific large-scale social entity emerged in the nineteenth-century USA. However, a more widespread opinion implies that the mass middle class developed with the transition of societies in the Western Europe from the industrial phase to the post-industrial one. During that period, the number of people in the group between the rich and the poor significantly increased, and structural positions corresponding to middle class started to form on a mass scale in the economic structure of the society. This process was facilitated by several factors that had to do with the development of the society and its economic structure during that historical period. Mass production growth led to an increased demand in highly qualified workers and experts; consolidation of production facilities and more complicated management processes resulted in the appearance of a broad category of managers. Developing social infrastructure, including education and healthcare systems, and growing number of universities and colleges contributed to an increase in the number of typical middle class representatives – doctors and teachers. Another factor was the economic and social policy that now focused on supporting middle class instead of helping the poor, because it was the middle class that could, with its growing wealth, provide the economy with workers possessing high-quality human capital, as well as stimulate general economic growth due to a stronger demand in goods and services. As a result, there emerged a major social stratum of non-manual workers that received income in salary for their skills and competencies – in other words, the middle class.

Over time, however, the middle class was becoming less homogeneous, which was reflected in new approaches to its analysis. The middle class was divided into a "new" middle class (qualified specialists and professionals receiving returns on their human capital) and "old" middle class (small entrepreneurs receiving returns on economic capital). Eventually, the "old" middle class also split up into micro-entrepreneurs and the self-employed, on the one hand, and entrepreneurs engaging external workforce, on the other. Due to the heterogeneity of the "new" middle class, various scholars introduced the categories of professionals and managers, professionals and semiprofessionals (based on further differentiation of the income-generating resources). It was noted that all these subgroups have their own specific features and different life chances and prospects of future development.

Thus, it is not a one whole middle class, but "middle classes," or separate subgroups, that increasingly often become the object under consideration. The upper stratum of the new middle class, its "elite," is of particular interest here. This stratum has received different names from different researchers (upper middle class/middle class core/professionals/service class, etc.) but consists, in fact, of highly qualified white collar workers with unique competencies that bring them returns in form of income. Researchers name different

key features of this group, including their work autonomy, high level of culture capital, availability of power at work place, specifics of employment contracts, high level of investments in human capital, etc.

## The History of Middle Class Studies in Russia

Russian sociology also experienced transformations in approaches to the middle class analysis amid changing historical realities of the country. In different time periods, middle class was charged with functions that were considered the most important in certain socioeconomic or political contexts, and the idea of those functions was changing along with the development of society: during different periods of the new Russia's history, the middle class was successively viewed as an indicator of the liberal reforms' efficiency, as the most adapted socioeconomic group, as a potential modernization actor, as an agent of political transformations, etc. (Avraamova and Maleva 2014).

In the contemporary history of Russia, a surge of interest in middle class studies in the 1990s was explained by the fact that the middle class en masse was considered to be a social basis for reforms and at the same time a gauge of ongoing social transformations efficiency. Then, with a deteriorating social and economic situation, the focus shifted to adaptive capabilities of the middle class. In the early 2000s and during the period of further economic growth, researchers addressed functions that theoretically could belong to the middle class, and some studies were dedicated to analyzing the actual performance of those functions. However, results typically showed that certain functions were still uncharacteristic of the Russian middle class (for instance, an active political role), while the most successful behavior proved to be in the areas of consumption and innovation.

Another special topic is the role of the middle class in building a civil society. Some research works concerned a need for democracy among middle class members (this issue has long been the focus of attention of foreign researchers), as well as their attitude towards law and order, authorities and state as a whole. In Russia, this aspect of the middle class sparked particular interest after a wave of protests in 2011–2012 that led to discussions about Russia's further development. However, analyzing if it was the middle class that led the protest movement again runs into the methodological problem of the middle class definition. In particular, the degree of differentiation among the protesters, according to empirical data, was fairly high and their self-identification was not the same, therefore it is incorrect to speak of them as middle class. On the other hand, there was emphasized a certain similarity between the protest movement in Russia and new social movements that emerged in Western countries after the 1960s and were initiated by the "new" middle class or its certain professional subgroups (in contrast to earlier social movements that had mostly lower classes, as well as workers and farmers as their social basis) announcing new demands and emphasizing new, typically middle class problems – the freedom of expression, the problem of identity, etc.

Studies of the relation between the middle class, civil society development, and democratization in Russia continue, and a common answer to the questions raised has not yet been found, although the majority of researchers speak about low political activity of the Russian middle class, its tendency to solve problems independently and individually, and the lack of a foundation for middle class self-identification as a united social entity.

## Approaches to Identifying the Middle Class in the Russian Society

All approaches to identifying the middle class applied by Russian sociologists can be divided into three main groups.

The first approach can be called an economic one. It relies on the idea of the middle class as the main consumer of goods and services, and its crucial criteria are those defining the standards of living and consumption. Therefore, typical issues

under consideration here include income and expenses, ownership of real estate, durable goods, etc.

At the same time, there exist two broad subgroups of methodologies within the economic approach that are based on the amount of income. The first ones can be called absolute as they rely on the predetermined specific income figures, and the second ones are relative as they are based on average or median income figures and determine a middle class identity by comparing the real incomes with these thresholds that are supposed to reflect the typical living standards of a certain society.

A common approach in the first group is the World Bank's methodology, according to which those who have a consumption level of at least 10 dollars a day at purchasing power parity are considered middle class; households with per capita consumption of 5–10 dollars a day are viewed as vulnerable and with 5 dollars or less are viewed as poor (Grant and Hansl 2015). These estimates are based on the results of the World Bank's international empirical studies in many regions of the world.

Applying these thresholds to the empirical data of 2000–2010 allows to make a conclusion that the middle class has significantly grown in numbers over that decade, especially in medium-income countries; nevertheless, not all of these countries can be named "middle-class nations," which means not all of them have a significant share of the middle class population. However, Russia can be referred to as a "middle-class country." Moreover, it holds one of the leading positions among developing countries in terms of the middle class size. According to the World Bank, the middle class share grew from 27% to almost 60% between 2000 and 2010, with an increase not only in the numbers but also in the purchasing power. Under this approach, middle class growth factors included rising salaries and pensions, as well as demographic changes related to dependency burden.

Using this methodology to analyze data from the recent Russian studies (2015–2016) demonstrates that the middle class identified this way comprises the majority of the population – even amid an economic crisis it includes about 90% of Russians. Separating the upper middle class under this model will not solve the problem of heterogeneity, as the bulk of the population remains in the same group which is the core middle class with consumption of 10–50 dollars a day at purchasing power parity.

As for relative approaches (more common in developed countries), the middle class is also identified using different techniques. For instance, it may comprise all people with certain income percentiles (like third quintile, 2–4 quintiles, 3–9 deciles, etc.), but in this case the size of the middle class is predetermined. In other versions of this approach, income limits are based on their relation to median income in the country. A typical range would be 0.75–2 medians, and according to Russian studies, this includes about 60% of the population. However, the standards of living for this major social group are quite modest, as the median income in the country is fairly low (Anikin et al. 2016).

It needs to be emphasized that an approach like this distinguishes not the middle class per se, but the middle strata, although the failure of the Russian middle class to meet the Western wealth criteria is often used as an argument against the existence of the middle class in Russia.

The second approach is based on the self-identification principle. According to it, the middle class consists of those people who identify themselves as such. This approach can be fruitful when analyzing the political consciousness of various social groups, as self-identification is closely related to social well-being, demands to the state, etc.

As the data from different Russian research centers demonstrate (for instance, from the renowned Levada Center), in the past 20 years the vast majority of respondents in Russia self-identified as middle or lower middle class/stratum – this is the result of the Russian people's desire to "be like everyone else." Only after the crisis of 2008–2009 there were notable changes in this distribution: the number of people referring to themselves as lower stratum increased. But this stratum cannot be called homogeneous, so it is not possible to speak about a "class." As the analysis

shows, self-identification is not determined explicitly by profession, education, or level of income but is primarily related to the division of "us/them" ("them" means power, politics, authorities). Besides, in this identification the key element for Russian population is the attribute "middle," not the noun "class."

Finally, the third approach is the most common in the Russian sociology. It is based on the traditions of Neo-Weberian analysis and involves a multidimensional stratification when one needs to meet a number of criteria simultaneously in order to qualify as a middle class, household or individual (including such criteria as education, social and professional status, self-identification, income, etc.).

All attributes of class that are used as criteria for class identification in this approach should contain essential, distinguishing characteristics of it as a social class. Within the class structure, the lower class has no resources sought by the market, the working class offers to the economy its simple capacity for physical labor, which is homogeneous and easily replaceable, and the middle class possesses human capital which generates income on labor markets. Therefore, its key characteristics are social and professional status and education (in Russian case, thresholds are often set as nonmanual work and possession of at least secondary specialized or higher education). Moreover, in Russia these two criteria often are complemented by the criterion of wealth, as income and salaries inequality in the country is partially related to nonmarket factors: their size may depend not on the education or social and professional position but on the industry, region, etc. Sometimes, these criteria are also complemented by self-identification, in order for the middle class to be characterized by the shared sense of its social position and self-consciousness.

It should be noted, though, that the list of criteria used for the middle class identification, as well as their qualifying values, differs significantly and is often substantiated according to different research traditions and concepts. This leads to inevitable discrepancies in evaluating the size of the middle class in the modern Russian society (from declaring its absence to estimating its share at 40–50%). However, there is relative consensus about the size of the middle class in the range of one fifth to one third of the population (studies by the NRU HSE, Institute of Sociology RAS, Institute of Philosophy RAS, Institute of Social and Economic Studies of Population RAS, etc.). At the same time, some scholars point out that the middle class core – its most stable part with most distinct class specifics and characteristics – comprise a smaller share in the middle class a whole, which means that the process of middle class formation in Russia still continues.

Quite often, the list of middle class criteria in Russia becomes significantly bigger. Going beyond the scope of structural analysis (that implies defining middle class based on social^ structural positions) and complementing it by functional analysis (focusing on the functions of a certain social entity), researchers start assigning the middle class with different and often opposite functions, ranging from ensuring social stability or supporting traditional values to becoming an agent of innovation or modernization. However, approaches of this kind that rely on functions ascribed to the middle class do not allow to obtain a clear understanding of the actual characteristics of the existing middle class, regardless of how successfully it performs certain functions.

It should be noted also that middle class studies in Russia usually focus on the "new" middle class, that is, those who receive returns on their human capital – skills and qualifications. As for the "old" middle class, its share in the Russian social structure is insignificant. Russia is considerably behind Western and Eastern Europe, as well as the BRIC countries in terms of business activity. For that reason, the "old" middle class accounts for an insignificant portion of the Russian population and middle class as a whole.

Describing qualitative features of the Russian middle class, scholars point out different aspects (Maleva 2003; Tikhonova and Mareeva 2009; Gontmaher 2013; Gorshkov and Tikhonova 2016). In general, one can speak about the middle class successfully performing the function of consumption and being the agent of innovation practices and behaviors. Among its representatives, active socioeconomic strategies and practices are

more common (regarding labor markets, financial markets, investments in health and education, etc.), as both the relevant norms and values and resources (human, social capital) are available for their realization. The life chances of middle class representatives differ considerably from the life chances of other social groups. However, the middle class should not be overly idealized, either: in terms of political behavior, the middle class is not as active, as it is expected. The ideas of middle class members about the optimal social and political system are inconsistent and quite often conflicting. The middle class is unlikely to initiate reforms, although it may serve as a social foundation for them. So far, middle class members prefer to act independently and unofficially to protect their interests, using their economic and social capital, and not the formal institutions.

An important feature of the Russian middle class pointed out by many scholars is its occupational structure: public sector workers have more chances to become middle class and their share in this social group is higher as compared to market sector workers. This shows that structural positions corresponding to the middle class have formed first of all in the public sector of economy. This fact can influence the values and attitudes of the middle class, including the attitude towards the role of the state in the social life and the need for social and economic policies.

In addition, researchers often pay attention to the lack of homogeneity in the middle class and speak about the need to consider its separate subgroups, either in the context of incorporated professional groups (professionals – semi-professionals – routine workers) or in terms of its concentric structure (core – periphery). This does not, however, contradict the fact of the middle class existence and complies with the abovementioned logic of its analysis in the Western society typical for the 1980s.

## Conclusion

The lack of a single definition and analysis approach results in different estimates of the middle class size in the modern Russian society based on various criteria and their threshold values. However, middle class analysis under the most common multidimensional approach shows that the main limitations for its growth and expansion come from the established social and occupational structure of the economy.

If a stable middle class formation is viewed as one of the priorities of the state socioeconomic and, more importantly, social policy, then its mechanisms should be aimed at increasing full employment in information economy, service economy, and hi-tech industries; increasing the resource potential of the population by encouraging investments and raising the returns on human capital investments; creating institutional conditions enabling middle class members to solve their problems independently, etc.

At the same time, the middle class expansion can lead to a smaller share of population exposed to poverty risks, and the stabilization of periphery groups can prevent impending financial disadvantages. It would also contribute to the reduction of social tensions related to excessive inequalities. Or another solution to this problem could lie in ensuring the mechanism of social mobility that could enable representatives of other social strata to occupy middle class positions in case the necessary education and qualifications are present. Lastly, solving the middle-class problem could provide Russia with long-term strategic advantages resulting in higher quality of human capital in industries that are key for the country's position in the global economy.

# Migration Impacts of State Policy

David A. Campbell
Milligan College, Milligan College, TN, USA

## Synonyms

Economic freedom; Internal migration; Marijuana legalization; Public goods; Same sex marriage

## Definition

*Internal migration* is defined as moving from one location to another within the same country.

*State policy* is the collection of laws that are written and implemented by each of the 50 states and are applied within each state's own jurisdiction.

## Introduction

### Theoretical Origins

Internal migration is a path of research that has been well worn by economists, political scientists, and demographers for over 50 years. One particular kind of migration involves migrants seeking out local governments that offer a package of public services closely aligned with his or her individual preferences. This theory was first put forward in 1956 when Charles Tiebout suggested that localities within a country compete for migrants by offering alternative packages of public goods (Tiebout 1956). Over time, his theory was expanded to include the impact of various types of fiscal policies that include both public expenditures and revenue generation.

## Contemporary Applications

Due to the increasing prevalence of reliable datasets related to economic and personal freedom, research has begun to focus on internal migration in the context of freedom (Ruger and Sorens 2009). Several studies confirm the positive role that economic freedom has on migration (Cebula 2014). Initial work on migratory responses to personal freedom has been mixed, generally finding that the presence of any migratory impact is dependent on the specific issue (Cebula et al. 2015). The legalization of same sex marriage and recreational marijuana use are two high-profile examples of recent changes in personal freedoms. Evidence from state law changes on these issues provides evidence that any migratory response depends on the specific freedom in question (Campbell 2016).

M

## Internal Migration Impacts of State Policy

### Model Framework

Charles Tiebout's original model of migration was published as a response to the theory that no market-based mechanism can be used to determine the appropriate level of government expenditure on public goods (Musgrave 1939; Samuelson 1954). Instead of facing the unhappy conclusion that citizens would simply have to accept a high degree of allocative inefficiency in the provision of these services, he published the seminal article "A Pure Theory of Local Expenditures."

After acknowledging the difficulty of achieving any market mechanism at the federal level, Tiebout proceeded to envision that a form of competition would be possible among local governments. Specifically, he saw these local governments as offering alternative packages of public goods, or "revenue expenditure patterns" (Tiebout 1956). Public goods are characterized by the inability of

providers to exclude individuals from consuming the good, and also by the ability of multiple individuals to consume the good simultaneously. These characteristics make the provision of such goods difficult for markets to achieve and are therefore usually provided by government. Consumer-voters would have the opportunity to select the local government offering a package of public goods that most closely aligns with his or her preferences. Each consumer-voter casts a ballot with their feet by migrating to communities that offer his or her most preferred bundle of public goods.

Over time, the scope of the model has been extended. In addition to the provision of public goods, Tullock (1971) explicitly added taxes as a key element of the bundles offered by local governments, leading the theory to occasionally be referred to as the Tiebout-Tullock hypothesis. Eventually, economists began to include policy determinants of migration that are noneconomic in nature. These policy determinants include various measures of personal freedom such as the legal status of same sex marriage and recreational marijuana use.

The theoretical framework for analyzing migration ultimately rests on the individual. The individual decision to migrate is modeled as an investment governed by wage differentials and the personal costs of migrating (Sjaastad 1962). The benefit to migration is an increase in wage associated with better income prospects in another community. However, this benefit is balanced by the costs associated with the move. In a survey of early literature in the field, Greenwood (1975) finds five variables commonly cited as major determinants of the decision to migrate. They include distance, income, psychic costs, availability of information, and personal characteristics associated with the migrant such as age and education. Among these factors, Greenwood credits distance with being the most significant deterrent to migration. As distance increases, the psychic and information costs do as well. Because of these noneconomic costs that prevent wage arbitrage, many studies find that wage differentials endure.

As the basic framework for analyzing the migration decision evolved, the analysis of factors related to the Tiebout-Tullock hypothesis became more prevalent. West et al. (1976) put forward a conceptual framework for incorporating migratory effects into the analysis of various public policy choices. Consumers, governments, and businesses are actors in the model. They make choices that include the decision to migrate, the level of regulation, the size and scope of fiscal policies, and the location of industry. The ultimate objectives of the migrants in their framework are all related to their quality of life (West et al. 1976).

Working within this conceptual framework, the studies that followed have used a wide array of econometric techniques to evaluate the impact that public policy has on migration. Due to the availability of data, many studies use states as the unit of analysis. Despite the popularity of this approach, some concern has been raised about the considerable heterogeneity among different jurisdictions within a state (Conway and Houtenville 2001). Therefore, when the data allows, compelling studies have also been conducted on migration of a smaller scale, such as within a metropolitan statistical area (Percy et al. 1995). In addition to variation in the units of measurement, various statistical techniques have been used to analyze migration. These include cross-section, two-stage least squares, panel regression, structural vector autoregression, and most popularly gravity models. (Partridge and Rickman 2006) In the latter type, distance and population density are the key determining factors in the decision to migrate (Greenwood 1975).

## Fiscal Policy

The relative generosity of welfare programs was one of the first fiscal policy choices to be researched extensively from the Tiebout-Tullock perspective. While informative, early studies on this topic also had limitations such as the use of race as an instrument for the income level of migrants (Kumar 1977). Later studies corrected for this by targeting only migrants with incomes at or below the federal poverty level. The evidence continued to suggest that higher levels of welfare support tends to draw more low-income migrants into a community (Cebula and Koch 1989; Meyer 1999). Enchautegui (1997) finds that among women, single mothers with small children are

most likely to move based on the benefits to be received through welfare payments. Some research has even suggested that a state will lower its welfare payments in an effort to drive low-income residents into neighboring states (Brueckner 2000).

More recent studies have sought to include an array of state characteristics as controls to evaluate the Tiebout-Tullock hypothesis more closely. Generally, they can be broken down into three broad categories: economic, fiscal, and environmental (Cebula 2009). The economic dimensions of migration generally include measures of expected future income and cost of living. While higher expected incomes tend to attract migrants, a higher cost of living is a deterrent (Conway and Houtenville 2001; Cebula 2005; Cebula 2009). Fiscal factors can include tax determinants such as the personal income tax and property taxes, both of which are found to be significant deterrents to migrants (Cebula 2009). In particular, Saltz (1998) found that states with income taxes tended to attract fewer migrants. On the other side, expenditure per public school student was found to have a positive effect on migration (Cebula 2009). When considering environmental variables, studies have employed a number of instruments to evaluate the effect. They generally find that measures of environmental quality such as the availability of state parks, the quantity of hazardous waste sites, and the rate of violent crime are significant determinants of migration (Cebula 2005). Additionally, analysis of climate variables suggests that migrants are drawn to warmer, temperate climates. (Conway and Houtenville 2001; Cebula 2005; Cebula 2009).

In an attempt to focus on the fiscal determinants of migration, several studies have explicitly targeted the migration decisions of the elderly. Conway and Houtenville (1998) assert that the elderly are a key demographic to examine in the context of migration. In addition to their growing numbers, the elderly are a demographic that is predisposed to moving. Theory suggests that the elderly would seek out fiscal policy packages that differ from those sought by other demographics. Specifically, elderly migrants would be interested in states that lean more heavily on income taxes rather than property or consumption taxes. One area of particular avoidance would be states with large estate, inheritance, and gift (EIG) taxes (Conway and Rork 2006). They would also favor states with expenditure mixes that favor the health sector rather than education.

The empirical findings on elderly migration have been mixed in their support for the Tiebout-Tullock hypothesis. The data on the states that the elderly depart has generally been supportive, suggesting that the elderly are more likely to leave states with higher property and sales taxes, while being less likely to leave states with higher expenditures on health care (Conway and Houtenville 1998). Evidence has also been found to support the elderly being attracted to states with tax exemptions for food expenditures and pension income, as well as low welfare benefits and EIG taxes (Conway and Houtenville 2001).

Alternatively, some studies on the elderly have raised questions about the extent to which the Tiebout-Tullock hypothesis holds. In one instance, the elderly were found to be less likely to leave states with higher expenditures on education (Conway and Houtenville 1998). Another study using a panel regression to isolate the effects of policy across time found that reductions in EIG taxes did not have a positive impact on the number of elderly migrating to the state (Conway and Rork 2006). Finally, panel analysis of state income tax breaks for the elderly (such as exemptions on social security and pension income) did not find them to have an influence over the migration patterns of the elderly (Conway and Rork 2012).

## Economic Freedom

Research on the traditional elements of the Tiebout-Tullock hypothesis is compelling. Taken in aggregate, the literature suggests that the fiscal policy decisions of local governments have an impact on the decisions of migrants. In particular, evidence points to the influence that spending on programs such as welfare, education, and health care can have. Also, the level and type of taxation is found to be significant in many circumstances. When considered in conjunction with regulations on economic activity, these policy variables can

be considered in the context of economic freedom.

Incorporating the perspective of economic freedom has been an important extension of the Tiebout-Tullock hypothesis. Basic economic theory suggests that economic freedom is positively correlated with economic growth. Given this relationship, local governments with greater degrees of economic freedom should also boast some of the most vibrant economies. These fast-growing local economies would benefit not only current residents but also serve to attract migrants from less prosperous areas.

Ashby (2007) was the first to investigate the relationship between economic freedom and internal migration. An index was backed out using the Economic Freedom of North America to determine the level of economic freedom in each of the 50 states. This index is based on the overall size of government as measured through expenditure and transfer programs, the level and type of taxation, and the degree of labor market regulation (Karabegovic et al. 2005). Using a modified gravity model, Ashby (2007) finds that migrants are attracted to states with higher government expenditures and transfers, lower levels of taxation, and fewer labor market restrictions.

Beginning in 2009, the Mercatus Center at George Mason University began publishing a detailed index of the amount of economic and personal freedom in each of the 50 states. The economic portion of this index includes data on fiscal policies such as the tax burden, amount of existing debt, and size of the government workforce. It also includes data on regulatory policies such as those that deal with the labor market, tort law, health insurance, and occupational licensure. When taken together, these economic freedoms account for two-thirds of the total freedom ranking in the index (Ruger and Sorens 2009).

Studies that followed have had the benefit of using this detailed index in evaluating the impact of economic freedom on migration decisions. Incorporating widely accepted determinants of migration as controls, these studies have continued to find that better income prospects, temperate climates, and lower cost of living tend to attract migrants. After controlling for these variables, evidence suggests that migrants are attracted to states with higher levels of economic freedom (Cebula and Clark 2010; Cebula 2014; Cebula et al. 2015). In addition to the findings related to the economic freedom index, additional fiscal policy variables were included in the regressions to account for some dimensions that were not directly incorporated into the index. Specifically, measures of the state income tax burden were found to be a deterrent to migrants (Cebula and Clark 2010; Cebula 2014; Cebula et al. 2015). Also found to be a deterrent was the level of state property taxes (Cebula et al. 2015).

### Personal Freedom

The early part of the twenty-first century was a time of rapid change in the legal status of certain personal liberties. The Defense of Marriage Act (DOMA), passed in 1996, defined marriage at the federal level as the legal union between a man and a woman. In addition to effectively banning same sex marriages at the federal level, DOMA left open to individual states the ability to recognize the institution at the state level. Massachusetts was the first state to legally recognize same sex marriage in 2004. It was followed by Connecticut in 2008 and Iowa and Vermont in 2009. Numerous other states joined in the recognition of same sex marriage leading up to the Supreme Court ruling in Obergefell vs. Hodges in the summer of 2015. Based on the 14th amendment, this ruling effectively required all states to recognize same sex marriage.

The right to marry who you want is salient in the minds of many, particularly those who are unable to do so. In the context of the Tiebout-Tullock hypothesis, it is reasonable to expect that this issue would be significant enough in the minds of affected individuals to lead them to depart states with bans on same sex marriage and enter states that have legalized it. While research on this topic will be limited in its direct impact on future policy due to the Supreme Court ruling, it may yield insight on other popular liberalizations that have not found the closure that same sex marriage achieved.

The legalization of recreational marijuana use is an interesting candidate for analysis. While it

remains illegal on the federal level, individual states are currently able to determine the legal status of marijuana within their jurisdiction. There have been many incremental changes in the legalization of marijuana, such as reduced sentences and legalization of its use for certain medical conditions. However, some states have begun to legalize its recreational use. The first states to do this were Washington and Colorado in 2012. Alaska, Oregon, and the District of Columbia followed with laws that became effective in 2015. Once again, the variation in state laws and salience of this issue in the minds of some creates an interesting opportunity to examine the Tiebout-Tullock hypothesis in the context of personal liberties.

Some empirical work has already been completed that studies the relationship between migration and an aggregate measure of personal freedom. In addition to the economic dimension of the freedom index, Ruger and Sorens (2009) produce a detailed index for personal freedom. This index includes measures of freedom related to tobacco and alcohol use, marriage, education, gun control, and the use of marijuana. The personal freedom component of the index accounts for about one-third of the total freedom index score. Recent studies have found that when controlling for other known determinants of migration, higher levels of personal freedom tend to increase both the number of migrants into a state and also increase the retention of current residents (Cebula and Clark 2010; Cebula 2014).

The data produced by Ruger and Sorens (2009) is incredibly detailed and covers a wide range of personal freedoms. For example, when examining marriage freedoms, it includes a measure for the legal status of same sex marriage. But it also includes components that capture the number of days you are required to wait before getting married and whether any blood tests are necessary. Additionally, the measure for marijuana freedom includes an indicator for the legal status of recreational use. But also included in the indexed value are a number of nuanced aspects such as the decriminalization of first offenses, legalization of medicinal uses, and the maximum possible sentence for offenses. The result is a thorough and rigorous index of many different personal freedoms.

This makes for a good proxy of overall personal freedom. The positive relationships that have been found between the personal freedom index and measures of migration suggest that migrants seek out states with higher overall levels of personal freedom. That being said, it is difficult to believe that many migrants are aware of the detailed nuances of law that are covered by the index. When thinking about migration in the context of a specific issue such as same sex marriage or the legalization of recreational marijuana, it would be more reasonable to target high-profile law changes such as statewide legalizations.

Difference in difference analysis provides a great vehicle for narrowing in on the migratory effects of these specific law changes. Much like the later work of Conway and Rork (2012), a panel regression using the states as subjects has the potential to yield great insight. Conway and Rork (2012) used US Census estimates of migration as the dependent variable. Given the limited frequency of Census estimates and the need to secure enough observations in the dependent variable, their study spanned four decades. Such a model is not possible for the legalization of same sex marriage or marijuana due to the close chronological proximity of state law changes, but there are alternative datasets that may make the analysis feasible.

The Statistics of Income Division of the Internal Revenue Service produces migration data that uses zip codes on tax returns to track the movements of taxpayers. They then publish macro level data showing the inflow and outflow of migrants into each state. This data has the benefit of providing annual data for each tax year. In addition, it is very reliable as the tax returns are matched based on taxpayer identification numbers and traced from one zip code to the next. The largest limitations of this data are that it measures tax returns instead of individuals (though it does include the number of exemptions associated with the tax returns) and does not include any individuals who do not file federal income taxes. Preliminary research on the migratory effect of these single policy liberalizations suggests that

legalizing same sex marriage has a positive effect on the number of migrants entering a state (Campbell 2016). The results for recreational marijuana use are less conclusive, perhaps due to the limited number of states that have legalized it. It may also be the result of prevalent black market activity in recreational marijuana use that is not possible for same sex marriage.

## Conclusion

In an era of tepid economic growth and strained public budgets, it is more important than ever for states to compete economically. In addition to implementing policies that foster strong organic growth at home, states also compete to attract businesses and an educated work force. Over the last 70 years, research has shown that the fiscal choices of a state have a large impact on its ability to attract and retain migrants. In addition, state laws relating to personal freedoms have been studied. Some personal freedoms, such as same sex marriage, appear to attract migrants to a state. Other freedoms, such as the legalization of recreational marijuana use, are less conclusive. With continued competition between states for migrations, it is likely that economic and personal freedom on the state level will continue to expand.

# Migration of Older Adults

Andy Sharma
Social Sciences Division, Economics and Policy Studies, University of Denver, Denver, CO, USA

## Synonyms

Later-life migration; Older adult residential choice; Retirement migration

## Definition

Older adult migration refers to the residential choices made by adults (typically, near the retirement age of 65 years) with an emphasis on amenity-seeking behavior.

## Introduction

Social scientists (e.g., demographers, geographers, and historians) have formally studied the residential choices of older adults for over a century (Ravenstein 1885; Lee 1966; Stouffer 1940). Economists and sociologists have contributed additional insight into this important decision some Americans deliberate near retirement age (Conway and Rork 2006, 2011; Frey 2010; Johnson et al. 2005; Rogers et al. 1992; Speare and Meyer 1988; Walters 2002a). Policy analysts, regional planners, and public health scholars continue to expand this field of research and, most certainly, a large part of this is due to the aging of the United States (US) population – approximately 10,000 adults reach the age of 65 years every day and this has been on-going since 2011 due to aging of the Baby boom cohort (Vincent and Velkoff 2010; Walters 2002b; Sharma 2012a). By 2020, the 65+ age group will reach 56 million and this will approximate 18% of the total US population. With such a large group and one that will grow for the next two decades, understanding older adult migration (i.e., residential choice) can assist public administrators with planning for economic development, fiscal budgets, and health/social services assessment (Conway and Rork 2012; Serow 2003; Sharma 2011). The present article explores some of these issues and offers guidance on how public service professionals can prepare for a rapidly aging population.

## Theoretical Perspectives

### General Framework

Residential choice, or determining where to live, is a question posed by individuals' throughout the adult lifespan. College-bound students make decisions based not only on costs/tuition, academic prestige, majors offered, athletic events, and social functions but also geography, climate, urban/rural status, and regional amenities. After graduation, some will make another relocation decision due to employment prospects. In this case, wages/salary, cost of living, housing affordability, transportation, and crime will play just as important a role as social amenities (e.g., types of restaurants, availability of singles, nightlife), proximity to parents/family/friends, local culture, and natural landscapes (i.e., beach, lakes, mountains). Given most adults change careers multiple times, another relocation decision will be undertaken and, in this instance, may involve factors related to the public education system and community characteristics due to the potential for family formation and children. In later life, some will again consider relocation and focus on places that offer amenities and provide quality healthcare. For these older adults, the emphasis will now shift to a warmer climate, lower cost of

living, greater natural amenities, and wide range of social outlets (Howells 2011; Sharma 2012a, b; Walters 2000). Throughout the lifecourse, individuals will compare potential destinations by assessing **push** and **pull** factors (Rossi 1955). In his "Laws of Migration," Ravenstein (1885, 1889) first proposed this rudimentary framework where an individual is pushed away from the present location due to unappealing attributes and pulled towards another due to some attractive characteristics. Subsequent work by Dorigo and Tobler (1983), Thornwaite (1934), Tobler (1978), and Wolpert (1965, 1966) provides insight into this comparison matrix employed by individuals.

## Lifecourse Approach and Older Adults

For older adults, decisions involving retirement, health, spouse's health, value of assets, and presence of children/grandchildren are salient lifecourse factors which interplay with "pull of amenities and push of environmental stress" (Wiseman 1980, p. 146; Wiseman and Roseman 1979). The Litwak-Longino Model (1987) succinctly captures some of these elements by constructing a typology of later-life migration. According to this framework, older adult migratory decisions can be classified into three stages: (1) the first move is undertaken by healthy seniors and influenced by pull factors associated with amenities, (2) the second move is motivated by declining health and brings the older adult closer to family/friends, and (3) the third move is prompted by widowhood combined with failing health and transports the individual into institutional care. (An important note: the older adult need not undertake all three moves nor does the move need to be sequential.) Walters (2000) extends this framework by highlighting the spatial dimension to amenity-seeking behavior during the first move, which is the focus of this chapter. In particular, the inclination to gravitate towards areas with warm climates and multiple leisure activities. In addition to the spatial component, both Walters (2000) and Sharma (2013) build upon this typology with the finding that older adults with minor disabilities also exhibit amenity-seeking behavior. This is important to note (discussed in the next section) due to health planning implications for destination states. Additionally, Frey (1995, 2008) and Sharma (2015) contribute to a richer understanding of older adult migration by highlighting network/chain migration when assessing in-migration streams into amenity-rich destinations such as Arizona and Florida. This is a worthwhile finding for it uncovers social/friendship ties can also serve as a pull factor (Cuba and Longino 1991; MacDonald and MacDonald 1964; McPherson et al. 2001).

## Select Destinations

### Arizona

One major destination (i.e., area of heavy in-migration) is Arizona. For over three decades, older adults have flocked to this southwestern state for it offers ample sunshine and warmth during the winter months. Arizona is also known for several leisure activities: baseball spring training camps for the Major League, multitude of golf courses, vibrant art and cultural scene, access to world-class spas/resorts, and quality healthcare. The draw for such amenities is evident in *A Profile of Older American's* 2015 report, which found the population aged 65+ increased by 46% in Arizona from 2004 to 2014 (US Dept. of HHS 2015). According to a recent analysis on migration for all states from 2006 to 2010, Arizona lost nearly 109,000 adults aged 60+ due to out-migration but gained approximately 900,000 older adults from domestic in-migration (Hermalin and Neidert 2014). As for the most recent census estimates, Arizona's population aged 65 and older approximated 16.4% as of July 2015 and this signifies an increase from 13.8% from April 2010 (US Census 2015). Given the total population for the state was over 6.8 million in 2015, this is a sizeable amount.

## Florida

This southeastern state has been and continues to be a top draw for older adult in-migration (Conway and Rork 2010, 2016; Frey et al. 2000;

Haas and Serow 1993). For nearly four decades, retirees have congregated to the coastal areas of the Sunshine state. Fort Lauderdale, Fort Myers, Naples, Orlando, Sarasota, Tampa, and West Palm Beach receive the bulk of retirees seeking year-round warm weather, coastal living, world-renowned golf and tennis resorts, and international cuisine (Sharma 2012a). According to *A Profile of Older Americans* most recent report, the population aged 65+ increased by 30% in Florida from 2004 to 2014 (US Dept. of HHS 2015). In terms of migration, Florida lost nearly 235,000 adults aged 60+ due to out-migration but gained over 2.8 million older adults from domestic in-migration from 2006 to 2010 (Hermalin and Neidert 2014). As for census estimates, Florida's population aged 65 and older approximated 19.4% as of July 2015 or nearly one resident in five is classified as a senior, which is a considerable amount given the total population for the state was over 18.8 million in 2015 (US Census 2015). In some counties (e.g., Sumter, Charlotte, Sarasota), the percentage aged 65+ exceeds 30% (Pew Research Center 2015).

## Nevada

This southwestern state has become a top destination for older adults during the past few decades. With mild winters, scenic mountain ranges, and plentiful outdoor activities, older adults are drawn to this state famous for gambling, tourism, and entertainment. According to *A Profile of Older Americans* report, the population aged 65+ increased by 52% in Nevada from 2004 to 2014 and this is among the highest in the nation (US Dept. of HHS 2015). In terms of migration, Nevada lost nearly 25,000 adults aged 60+ due to out-migration but gained approximately 348,000 older adults from domestic in-migration from 2006 to 2010 (Hermalin and Neidert 2014). As for census estimates, Nevada's population aged 65 and older approximated 14.6% as of July 2015, an increase of nearly 3% from 2010 and nearly double from the past three decades (Powell et al. 2006; US Census 2015). Nevada's older population steadily continues to increase and this is attributed to two driving forces: migration into two, large urban centers (i.e., Las Vegas and Reno) and aging in place in rural areas.

## Emerging Destinations

With steady progress in geriatric medicine and a better understanding of how economic, environmental, genetic, and social factors influence morbidity and mortality, affluent and educated older Americans are enjoying slightly longer life-spans and a higher quality of life. Instead of seeking traditional retirement communities which offer "leisure" amenities, some of these older adults are relocating to regions better known for biking, hiking, and trail-walking – more of the "adventurous" amenities. This is evident for state demographers have noticed substantially increased older adult migration into Colorado, New Mexico, North Carolina, Oregon, Tennessee, and Utah during the past few decades (Frey 2010; Howells 2011; Hermalin and Neidert 2014; Sharma 2012b). These new destinations of choice also offer some of the long-standing amenities sought by retirees – relatively mild winters with ample sunshine, vibrant arts/music/culture scene, multitude of options for fine dining, and quality healthcare in urban centers.

## Select Origins: General Observations

### New Jersey, New York, and the Midwest (Illinois, Iowa, Michigan)

As mentioned previously, residential choice is attributed to both pull and push factors. For older adults, certain characteristics of the origin state (i.e., sending area) may no longer be appealing. That is, soon-to-retire or retired individuals may be pushed away from areas they once considered home (Riley et al. 2016). What could be such potential factors? Although no longer in the labor force, older adults still place considerable emphasis on economic characteristics: income tax, sales tax, estate taxes, property taxes (since most own homes), and inheritance taxes. Both New Jersey and New York maintain high tax

rates and are among the list of most expensive places to live for older adults (Tax Foundation 2016; Howells 2011). An early study by Shan (2010) found a positive association between property taxes and mobility among older adults, and recent work by Önder and Schlunk (2015) also finds older adults migrate away from such states. Interestingly, Önder and Schlunk (2015) continue to find a positive association for property taxes and in-migration (Conway and Houtenville 2001; Voss et al. 1988). In contrast, recent work by Conway and Rork (2012) does not reveal a consistent impact on migration from state tax policies. Moreover, these scholars suggest causality may be in the other direction. That is, states may enact policies to attract older adults rather than older adults being drawn to such states due to pre-existing state tax policies (Conway and Rork 2006). Although this classic problem of same-sign may still apply (i.e., higher property taxes positively associated with both out-migration and in-migration), what remains applicable is older adults with a propensity to migrate examine tax rates between states and take into account how those taxes are used to pay for amenities.

Older adults, who are no longer tied to work/employment/family, may also find living in large, population-dense urban centers costly. According to PayScale, the cost of living for expenses related to energy, health care, housing, grocery, and transportation are higher for various New York cities (e.g., Albany, Buffalo, New York City) relative to several areas of long-standing and steady older adult in-migration in Florida (e.g., Cape Coral, Tampa). As Önder and Schlunk (2015) find, higher living costs can push older adults from origin states. A substantial body of research supports the hypothesis that older adults seek to maximize their fixed income by relocating to places with lower living costs (Conway and Houtenville 1998, 2003; Fournier et al. 1988). This may be one reason why older adults exhibit amenity-migration into rural or nonmetropolitan areas (Brown and Glasgow 2008; Gosnell and Abrams 2011). In general, housing and food costs tend to be lower in such areas, thereby increasing purchasing power for highly demanded nondurable goods.

## Implications for Public Administrators and Policy Analysts

Older adult migration has policy implications for both the destination and origin state. Arizona, Florida, Nevada, and other emerging areas need to be aware of the economic, health, and social tradeoffs that come with population shifts (Das et al. 2009; Graff and Wiseman 1990; Robison and Moen 2000; Serow 2003). For example, healthier and more affluent in-migrating retirees may boost the local economy with increased spending (Day and Barlett 2000). These older adults allocate significant time to driving, frequenting restaurants, visiting art galleries/museums/theater, engaging in community service activities, and volunteering (Gauthier and Smeeding 2003; Krantz-Kent and Stewart 2007). Such an inflow of activity requires communities to consider greater public investments towards housing and transportation (Sharma 2012a, b).

Receiving regions also need to consider increased use of health and social services. As Sharma (2015) notes, some older adults migrate near amenity-rich destinations despite moderate physical limitations. If these older adults decide to age-in-place, then some neighborhoods will dramatically shift in population structure with greater health needs. For example, disability is one notable health consideration among older adults (Sharma 2016; Stenholm et al. 2015; Wahrendorf et al. 2013). The on-set of disability not only reduces quality of life but dwindles personal economic/financial resources, places a heavy mental and physical burden on family care-givers, and is costly for the state. Public service professionals should consider devising plans of actions that include (a) financial, (b) health, and (c) estate planning education/seminars for counties experiencing significant older adult in-migration.

Policy analysts and public administrators in sending areas must also prepare for an aging population. If healthier and more affluent older adults leave and this coincides with (A) out-migration of younger adults and (B) aging in place of the remaining older population, then some counties may become aged enclaves lacking diversity,

being deprived of economic and social capital, and facing a costly burden from high levels of cognitive and mobility disability (Frey 2010; Lehning et al. 2015; Michael and Yen 2014; Rogers and Woodward 1988). In this instance, community planners and state officials must work together to ensure such places (1) do not become food deserts, (2) lack health professionals, and (3) offer limited open/green spaces (Park et al. 2015; Villanueva et al. 2015). A collective effort from public service professionals can ensure older adults maintain health and well-being in the built environment. Housing is another area of concern. Myers and Pitkin (2009) and Myers and Ryu (2008) highlight implications from a Baby boomer sell-off where certain regions (e.g., Midwestern and Northeastern states) may experience a surplus of undesirable homes which may sit on the market for long periods, thereby adversely impacting the economic and social capital of the community. Public service professionals must be aware of both increased demand from in-migration and increased supply from out-migration.

## Conclusion

Throughout the lifecourse, individuals and families make decisions about where to live. Younger adults are much more likely to be mobile due to college, employment prospects, and family formation, while many older adults prefer to age-in-place (Lehning et al. 2015; McHugh and Mings 1996; Plane and Jurjevich 2009; Rogers and Woodward 1988). However, for those with minimal attachment to place, later-life migration is the next step. With the desire to seek amenities and enjoy their remaining healthy years, older adults continue to migrate to select destinations in Arizona, Florida, Nevada, North Carolina, and Tennessee. In time, these steady and well-established streams shift the population structure, requiring local public administrators, policy analysts, and other public service professionals to re-evaluate the economic, environmental, health, political, and social landscape. Emerging destinations may not see such changes yet. Nevertheless, proactive public service professionals should take note. As highlighted above, a sizeable older adult population presents unique challenges to economic development, fiscal budgets, and health/social services. These challenges also apply to sending destinations, such as Illinois, Iowa, Michigan, New Jersey, and New York. After outmigration of relatively healthier and more affluent older adults, county officials should assess how aging-in-place will impact public service needs. With a thorough understanding of demographic changes, public administrators and policy analysts can ensure their residents receive optimal provision of services.

# Migration Trends from the Central America's Northern Triangle to the USA

Hugo Renderos
Southeastern Okhahoma State University, Durant, OK, USA

M

## Synonyms

Asylum; Central America; Comparing; Migration; Migration trends; Northern triangle; Refugees

## Definition

*Migrant* is defined as a person that is outside of the territory in which he or she is a citizen of, is not subject to its legal protection, and lives in a territory belonging to another state of which he or she is not a citizen and is not granted the same rights legally recognized as inherent by the host state of the status of refugee, of naturalized person, or of nationals.

*Trend* is a pattern of small degrees of change in a situation, condition, output, or process or a tendency of a series of pieces of information moving in a certain direction over time that may be represented by a line or curve on a graph.

## Introduction

### Theoretical Origins

People move from one place to another and from one territory to another. People, since the beginning of time, have traveled and migrated from places afar to areas nearby. Over history, people move from their places of origin for various reasons. These migrations are motivated by civil wars, natural disasters, nation building, political or religious persecutions, and economic expansion or depression or to simply populate the earth (Figueroa 2015; Hildebrandt and McKenzie 2005). This entry limits itself to migration trends from three Central American states, Guatemala, El Salvador, and Honduras during the last four decades. It specifically looks into migration by Central Americans to the United States of America (USA) as they envision it as a safe haven and land of opportunities.

Theoretically speaking, the New Economics of Migration Theory (NEMT) posits that migration is an economic family influenced decision made by migrants and whose return are seen as remittances (Figueroa 2015). According to NEMT proponents, Central American migrants migrate for economic reasons. The lack of employment opportunities is one major factor pushing migrants out of their countries of origin (Donato and Sisk 2015). Tucker et al. (2013) argues that migrants migrating northward claim encountering economic hardships and difficulty securing employment in their countries of origin as a major element in deciding to migrate northward. According to migrants, economic factors are but one push factor driving them out of their countries of origin.

## Contemporary Policy Application

For the last 3–4 years, at the center of public debates about the rising numbers of Central American migrants, and especially unaccompanied minors, are the provisions of the William Wilberforce Trafficking Victims Protection Reauthorization Act (TVPRA) of 2008. The act serves as a guide for treatment of minors apprehended at the southern US border and assigns different treatment to citizens apprehended from both bordering countries to the north and south, Canada and Mexico, respectively (Reichert and Massey 1980; Fonseca and Moreno 1988; Goldring 1990; Durand and Massey 1992; Donato 1993, 1994; Cerrutti and Massey 2001; Donato et al. 2008; Creighton and Riosmena 2013). Citizens apprehended from noncontiguous countries, such as Central American states, receive a totally different treatment from immigration officials. Apprehended Canadians and Mexicans, as long as they are not trafficking people, are immediately processed and deported (Donato and Sisk 2015). On the other hand, Central American citizens are apprehended, detained, placed under removal proceedings, and released after being processed. For minor children, they are released to their parents or a legal guardian until a court date is established for their immigration hearing (Donato and Sisk 2015).

During the summer of 2014, when hundreds of thousands of minors were apprehended at the southern US border, each minor was assigned a court date after processing, which oftentimes had a 2-year waiting period, creating a backlog of immigration court hearings. The long waiting period suggested and interpreted by Central Americans that the USA was allowing all undocumented minors an opportunity to receive legal status once they had been through the immigration vetting process (Caldwell 2014a, b; Chrishti and Hipsman 2014). Additionally, Chrishti and Hipsman (2014) suggest the long waiting periods, as well as the Deferred Action for Childhood Arrivals (DACA) program, gave potential migrants the perception that the US's treatment of minors had changed creating the false idea that undocumented minors entering the USA were granted legal status. DACA insinuates the idea that minor undocumented children are welcomed with open arms once they touch the US territory and will ultimately be granted legal permanent residency (Donato and Sisk 2015; Sacchetti 2014).

## Classification of Migrants

Migrants are not easily classifiable because the reasons for which they migrate vary and depend a lot on each individual's circumstances. Koser (2007) attempts to classify migrants into one of three categories, voluntary or forced migrants, political or economic migrants, or legal or illegal migrants. Voluntary migrants are usually individuals migrating because they have been expelled from a certain country for various reasons. One example is when Idi Amin, the former president from Uganda, expelled the Oriental population out of Uganda in 1972. Voluntary migrants are also known as forced migrants as in the case of the Oriental population expelled out of Uganda (Figueroa 2015; Koser 2007).

The second category of migrants identified by Koser (2007) is the political or economic migrant. Migrants under this category are usually refugees that migrate because in their countries of origin, they are not able to secure gainful employment or there is a total lack of employment opportunities. Having no employment opportunities, migrants are forced to look elsewhere for their survival. According to Figueroa (2015), political or economic migrants can either be low- or high-skilled migrants. High-skilled migrants are professionals trained in their countries of origin that have not been able to obtain employment in their field of training or if they have, they are underemployed.

The third category of migrants identified by Koser (2015) is the legal or illegal (documented or undocumented) migrant. Under this category, migrants entering the USA with visas (legal) and overstaying their visa period automatically become undocumented (illegal). Those migrants entering the USA as undocumented or employing fake documents are illegal migrants (Figueroa 2015; Koser 2007).

## Who Are the Central American Migrants?

The top three countries of origin for Central American migrants in the last 20 years are from El Salvador, Guatemala, and Honduras. Central Americans started migrating to the USA in large numbers in the late 1970s and early 1980s. By 1990, the number of Central American migrants in the USA nearly tripled (Stoney and Batalova 2013). The numbers have only increased after 2000. Central American migrants are the fastest growing population than any other region of origin from Latin America. "Central American immigrants' share of the total immigrant population in the USA has steadily grown for the past five decades, from less than 1 percent in 1960 to almost 8 percent in 2011" (Stoney and Batalova 2013, p. 1).

How do Central Americans enter the USA? Compared to other migrant groups in the USA, Central Americans are more likely to enter the USA as undocumented migrants and less likely to enter as refugees (Stoney and Batalova 2013). They are also more likely to attain lawful permanent residence through family petitions. There are certain commonalities shared by all three groups of migrants. They share very similar levels of education, socioeconomic status, and geographic distribution.

Studies conducted by the Migration Policy Institute showed that migrants arriving from all three Central American countries share low levels of English proficiency and formal education. Because they have a lower level of formal education, they were also more likely to have lived under poverty conditions in their countries of origin (Stoney and Batalova 2013). Furthermore, studies showed that these migrants were young and of working age. The minor migrant children apprehended at the southern US border from 2011 to 2014 stated they were looking to establish in three US cities, mainly Los Angeles, New York, and Washington DC, in this order (Stoney and Batalova 2013). From 2011 onward, Central American migrants have been mostly men. The majority of migrants are men but women have now started to increase in numbers.

## Push Factors for Migrating

A crisis arose out of the hundreds of thousands of migrants arriving at the US border starting in the

2010s. It reached an all-time high in 2014 when unaccompanied children started arriving at the border. There were also women with children arriving in record numbers, creating a crisis for US border patrol officials unable to process large numbers of migrants at one time. According to newly arrived migrants, various factors pushed them to migrate when interviewed. Some of the reasons provided ranged from fleeing the world's highest homicide rates, extortions, gang-controlled communities, domestic violence, crime impunity, economic hardships, and high unemployment, among others (Eguizábal et al. 2015; Olson and Zaino 2015).

For the past 10 years, Honduras and El Salvador have competed for having the highest murder rates in the world. For example, in 2007, El Salvador had the highest murder rate per 100,000 inhabitants, 58 murders. In 2008, Honduras passed this number reaching 60 murders per 100,000 inhabitants (Kennedy 2014; Olson and Zaino 2015; Seelke 2016). Again in 2009, El Salvador was number one for having the highest murder rate fixed at 70 murders per 100,000 inhabitants. A year later, Honduras passed the record with78 murders per 100,000 inhabitants (Kennedy 2014).

Territorial and economic control through visible gang presence often results in gang-controlled communities. Many migrants expressed they paid extortions in their countries of origin to prevent violent acts perpetrated against their own person or loved ones. The various communities from which migrants escaped were gang controlled. In order to guarantee their safety and security, gang members asked of each migrant to pay a certain amount on a weekly basis to respect their dignity (Seelke 2016). Domestic violence is prevalent in Central America, where the Northern Triangle has a high number of spousal rapes in comparison to the rest of the isthmus (Seelke 2016). El Salvador and Guatemala have the highest proportion of homicide victims under the age of 20. High unemployment rates are the economic hardships faced by migrants in the Central American region. Governments do not invest in generating employment opportunities for young professionals. Even after obtaining a university-level education, oftentimes professionals find themselves unemployed or underemployed. As a consequence, they are left with no other choice than to migrate north in search of a better quality of life.

## Pull Factors for Migrating

There are some existing pull factors motivating migrants to go north. Family reunification is one factor that is very prevalent among all migrants' decision to move north. Almost all migrants interviewed in the literature reviewed expressed having a relative living in the USA (Donato and Sisk 2015). One in three Salvadoreans has a family member living in the USA.

Economic opportunities are also pulling migrants north. Many migrants claim they are motivated to move northward because even if they work in the crop fields, they are earning money to send back to their loved ones (Donato and Sisk 2015; Kennedy 2014). Sending remittances back to their families increases living conditions for the ones left behind as they are able to afford attending higher education and provide for basic necessities migrants were not able to provide while living in Central America (Donato and Sisk 2015).

Yet another pull factor attracting migrants to move north is the educational opportunities they encounter once they reach their destination. For example, migrants learned to read and write English, which increased their employment opportunities and earn a higher salary than those that could not speak English (Donato and Sisk 2015). Having educational opportunities as youngsters was also a pull factor expressed by mothers and their children when asked why they migrated north (Donato and Sisk 2013, 2015). Being forced to join gangs in public Central American schools was a deciding factor when migrating north for accompanied and unaccompanied minors (Kennedy 2014).

## Implications

What are the implications for the host country? Are US citizens adversely affected by the

employment of migrants, documented or undocumented, in positions normally frowned upon by natives? Do natives really want to work in the fields picking strawberries in the hot California sun or under unsafe and unclean working conditions in meat packing plants? The answers to the above questions are no. Natives in the host country are not adversely affected by jobs normally performed by migrants because they are low paying, unclean, and unsafe positions that natives prefer to avoid (Epstein and Nitzan 2005; Peters 2014, 2015; Taylor and Dyer 2008).

On the other hand, there are positive implications on the receiving countries as remittances sent to the sending countries surpass the millions competing with foreign aid and international investments (Figueroa 2015). In 2012, global remittances reached $401 billion dollars among all three states (Figueroa 2015). Remittances help reduce poverty and improve health, education, and gender equality in the receiving countries. Remittances are sued for expenditures and investments, real estate purchases, and founding small companies (Ratha 2013; Mesnard 2004). Basically, the logic is quite simple: remittances increase income and income improves the quality of life (Figueroa 2015).

## Conclusion

In a global era, where every state is interdependent upon another, states have become borderless for the desolate, marginalized, needy, poor, and adventurous. Migrants are moving in waves and large numbers up north to the USA. The USA must come up with a comprehensive immigration policy for the millions of undocumented migrants already established within its borders. Migrants seeking a better life away from their loved ones and sacrificing their lives while working under unsafe conditions gives migrants an alternative to the life they leave behind. The push and pull factors influencing migrants' decisions to move northward are equally determinant. Migrants in Central America are looking to better their quality of life which they can only find in the USA.

# Military Bureaucracy

Mustafa Altunok
Public Administration Department,
Abant İzzet Baysal University, Bolu, Turkey

## Synonyms

Military administration; Military coup regimes; Military hegemony

## Definitions

The military bureaucracy, which continues to be one of the most powerful examples of bureaucracy even in modern times, differs from the civilian bureaucracy in that it corresponds to the military organization with an internal and external security center.

## Introduction

The bureaucracy, as the first concept that comes to mind in relation to the state and public administration, has been at the center of every political development. Bureaucracy, while theoretically pointing to an integrity, forms various clusters in itself and takes on a dual nature with the simplest classification. The military bureaucracy has a different meaning from resembling concepts such as military administration and civilian bureaucracy. The first classification may be a distinction between civilian and military bureaucracy. The military bureaucracy is different from the civilian bureaucracy in that it corresponds to a military organization with an internal and external security

center. Although they are used in an interchangeable way from time to time, military bureaucracy and military government do not mean the same thing. Military administration, located on a higher position than the military bureaucracy, encompasses basic elements and functions such as planning, organizing, staffing, financing, training, equipment, and maintenance of the military bureaucracy (Weber 2015: 2; Weber and Eliasson 2008: 2). Despite a more limited view within military administration, the military bureaucracy is a historical phenomenon that was situated within the center of idea of management, administrative efficiency, and mechanism. Based on this introduction, an argumentation about the origins, significance, and meaning of the military bureaucracy will be presented in this chapter.

## The Roots and Importance of the Military Bureaucracy

It is known that the bureaucracy has always been an important administrative mechanism from the ancient societies to the present day. Communities such as Sumerians, Assyrians, Ancient Egypt, China, Iranians, and Turks presented different examples of bureaucracy in the course of history. The increasing numbers of information belonging to these communities surprise increasingly today's people. One of the most influential people who addressed bureaucracy, which manifested itself as an organizational model in ancient societies and helped it gain its popularity today, is the famous German sociologist Max Weber. Weber's theory of bureaucracy is characterized by a variety of economic, administrative, religious, and cultural dimensions.

The reason why the military bureaucracy is this important is the mandatory presence of soldiers, which are the subjects of military bureaucracy, throughout the history for state societies. Historically, the most fundamental duties of the states have been achieving internal and external security, peace, and prosperity. The events that started with the battle of human beings against the nature and continued with the battle among people and took place in the course of life taught people to fight, defend, and attack. Specialized owners of these learned skills formed a group called the "soldier" in society. The existence of this group was required both for the support and protection of the people in power and for the wars. The presence of the bureaucracy emerged in ancient societies, and the wars that required military officers also broke out in these societies. The close relationship between neolithization and militarization can be sociologically attributed to the emergence of war objectives and conditions of war likelihood at the same time (Baechler 2011: 641). Considering that the most important event affecting the last 10,000 years is wars and security and defense are among the most important public services, the necessity and importance of the military presence is understood.

The importance of organization and social stratification has been emphasized since the emergence of the settled life and surplus product that emerged in line with the irrigated agriculture. On the one hand, there is a need to carry out production and on the other hand to calculate the amount of product produced and to protect it in a systematic way. It is necessary to promote order and security against conflicts within and between societies. Historically examined, it seems that soldiers have played an active role in all of these processes. This role, of course, requires concepts such as order, discipline, order-command, hierarchy, and authority. Regardless of how it is named, it is evident that these concepts are indispensable in terms of bureaucratic life.

## Is the Military Bureaucracy the Guardian of the System or a Threat to It?

The fact that economic and political life itself, and especially its protection, is in the hands of a certain social group makes that group privileged. This has allowed soldiers to have a bureaucratic space, border of which they defined to a great extent. It has been a widely seen fact in many societies since ancient times that soldiers obtained the right to use land in exchange of the services they provide and were allowed to use land for their military services (Weber 1995: 345).

The class of preventive services that the kingdoms built to protect themselves and then the officials who strove for protecting the interests of their community/tribe formed the professional armies that had the protective power of the states with the modern state. As the subject of the professional armies, soldiers have been both the means of force use by the state, and they have been positioned as the most important center of power.

In modern bureaucracies shaped on the heritage of civilizations such as the ancient Egypt and China, it would be useful to examine the ministry organization in order to understand the position of the military bureaucracy. The organization of the classical ministry is established on the axis of activities carried out by the states. The role of regulating and protecting the relations within and outside the country is taken on by the ministries of war and foreign relations, the role of regulating the relations within the individuals in the society and collective units is taken on by the ministry of justice and internal affairs, and the role of deciding with which resources and how needs of political and administrative system can be meet is taken on by the ministry of finance (Poggi 2007: 149). Accordingly, it is possible to arrive at the conclusion that the military bureaucracy has its own ministry organization with the existence of the ministry organization formed by different names such as war, defense, and security. Therefore, if the other ministry areas of activity are called civic, there is also a military-based (non-civic) ministry organization.

Looking at the period from the establishment of the first state to the present day, one of the most important characteristics of the powerful states and of the great leaders is the fact that they have powerful bureaucracies, especially military bureaucracies. The strong army is like an indispensable quality of strong leaders and states. But there is a very interesting point here. Although the strength of the leader's army against the other societies is a must, excessive power of the army can turn into a threat for the leaders in time. On the one hand, the leader becomes a conqueror by expanding his own power by a strong army, and on the other hand, the strong army can turn into a threat of losing his power and even his life to a point beyond control. Despite the fact that this seems to be more valid for older societies, it is possible to come across the same reality in underdeveloped societies today. In recent history, some presidents are seen to adopt invasion as an aggressive strategy for special interests at the expense of broad-based public interests, and they activate their military bureaucracies to establish a "global empire" and expand it (Farazmand 2009: 9).

An examination of the role, organization, orientation, and reflection of the role of military force, which is an actor of one of the ordinary public services, points to a vast field of research with unclear boundaries (Boene 2011: 79). This research area reveals different outcomes, results, and effects in every region. For example, in a developed country, the military bureaucracy refers to a group responsible for the "defense, security" services, whose area of work is defined by the laws, whereas it points to the authoritarian regime representatives, even those in power, in an undeveloped country. In this respect, based on the idea that the bureaucracy acts as a mirror and reflects the society that it originated from in every period of history (Dreyfus 2007: 26), it can be said that the developmental levels of countries and their bureaucracy qualities are related.

It is an accurate prediction that it is always probable that the relationship between the military bureaucracy and the civilian bureaucracy may become a power struggle. As a result of this struggle, they can become a category of military dictatorships within the underdeveloped country systems. These dictatorships emerge in environments where military elites are more powerful against the civilian population. The army, which is the only power well organized in the environment where powerful parties, unions, associations, and effective and independent mass media do not exist, is in a position superior over the social and political system. This situation should be considered in the context of the characteristics of the countries that generally count as underdeveloped or developing. It is really interesting that all of 56 military dictatorships in the year of 1985 were found in countries that had the relevant characteristics (Kışlalı 1998: 256).

The state, the actor of the phenomenon of war in the historical process, forced itself to use resources and production power of unprecedented scale so as to control the effects of resources (and possibilities of rivalry) on their population during the twentieth century (Poggi 2007: 151). At this point, it would be appropriate to talk about two points of tension related to military bureaucracies. One of these is the continuation of the need of communities for military from the primitive times to the day. The second is the fact that the military bureaucracy has the capacity to create anti-democratic conditions, despite all the stages that societies went through or anti-democratic practices they had to face until democracy was learned. On the one hand, security and defense form the main issue of the social and political agenda, and on the other hand, democracy can take forms like "low intensity democracy" (Gills and Rocamora 1992: 501–522) or insufficient democracy in situations where military dictatorships are strengthened.

Despite all the tensions, the military bureaucracy as a concept ranks among the meanings of the concept of bureaucracy. This concept can be described as one of the actors of the administrative system within the social and social scientific category (Bozkurt 1998: 43). Although the military bureaucracy has the basic characteristics of the bureaucracy that Weber theoretically shaped, the military bureaucracy is no exception to the extensively infamous bureaucracies. Even the military bureaucracy is more antipathetic than the general notion of the bureaucracy for many people (Sabrosky et al. 1982: 137). Although the military bureaucracy is an area where the elements of the bureaucracy are skillfully applied, such as hierarchy, continuity, commitment to written rules, and expertise, the attitude toward it is commonly doubtful. These bureaucracies are also called "organized anarchies" (Sabrosky et al. 1982), which produce institutional and interpersonal mutual policy as a very complex and differentiated structure. The sources of the bureaucracy can be listed as knowledge and expertise, decision-making power, political support, political apathy, and institutional ideologies, continuity, and stability (Peters 2001: 234–236). These sources have a more absolute and sharp quality than the civil bureaucracy for military bureaucracies. The anarchic structure of the military buriaucracy is reinforced by the ambiguities at the international level and the priorities of the defense policy (Sabrosky et al. 1982) because the number one item on the national and international policy agenda is promoting security. Therefore, military bureaucracy, which is a mechanism of this, feels itself privileged against the other bureaucratic structures.

## The Military Bureaucracy in the Modern Administrative Systems

Development of the military field and development of the administrative process as a field of science are intertwined with each other. The demonstration of military formations as the first bureaucratic organization model and the search for solutions to many needs and problems that arose during and after wars were determinant factors in the development of administrative theories. Since ancient times, the military field developed principles on how best to manage authoritarian organizations. In addition to principles such as control unit and control area, concepts and practices such as strategy, leader, and decimal system were born with military origin and then brought to the civil administrative area. The driving force of the military approach, which emphasized the strategy, is known to be reflected in the reconstruction philosophy foundations of the governments in the 1990s and in the total quality management movements of the 1990s (Shafritz et al. 2017: 212).

When the military bureaucracy is evaluated in terms of its current position, the USA, which is one of the major developed countries, has the strongest army of the world. After the collapse of the Soviet Union, the US army expanded considerably. Globally, it dominated the oceans and airfields. In many geographies, operations carried by the USA that support the United Nations peacekeeping forces and the armies of other nations are led by US Department of Defense, which is the largest military bureaucracy in history. 1.3 million

people are in the active duty, while 1.1 million people serve in the National Guard or Reserve. The forces are supported by 669,281 civilian personnel. These are all realized with a budget of $500 billion (Weber and Eliasson 2008: 1). This budget can be increased for certain years.

## Military Bureaucracy in Emerging Democracies such as Turkey

In addition to the example of the advanced army and the advanced military bureaucracy, the potential of the military bureaucracy to become a political actor manifests itself in the examples of different countries where the military bureaucracy aims to become a socially privileged cluster. Latin America, Middle Eeast countries, and even European countries are among the countries where the political and military bureaucracy make its presence markedly felt in political and administrative system. As one of these countries, Turkish political history has been shaped by military coups unfortunately. For this reason, it is one of the countries that has experienced the pathological aspects of the military bureaucracy more compared to its rational aspects.

In underdeveloped societies, as a reflection of military pathologies, military coups are generally realized with the motives as "the correction of the mistakes made by the political regime, the protection of the peace and order of the society, the preservation of the integrity of the state." But all of these coups were directed at governments democratically elected by the people. It is interesting to note that although the coup and coup attempts seem to be organized against the governments that are supposed to represent a certain political vision, irrespective of their ideologies, the society is always the one oppressed eventually. Every coup attempt reduced the level of development of these countries. Although the de facto conductors of these coups are actually the commanders of the national army in the military bureaucracy, it is often the common belief among people that some of the developed states are behind the coups. The data obtained show that this belief is not totally wrong or baseless.

## Conclusion

The military bureaucracy, which is foreseen to bear a non-political and a special character, has a two-dimensional nature all over the world, which makes it necessary to control it in relation to the expansion of the military field globally and also to reduce the potential risks of this expansion. For the good functioning of the military bureaucracy, it is necessary that it should be based upon a strict chain of command, hierarchy and authority. On the other hand, it is expected to function in a transparent, accountable, efficient, productive, and professional manner. This looks like a dilemma about the nature of the military bureaucracy.

## Definition

Military coup or coup d'etat is commonly referred as the violent overthrow of an existing government by power, usually in an unconstitutional or undemocratic way.

Military coup can be defined as the successful or unsuccessful efforts by the military within the state apparatus in order to seize and hold power of the current regime, typically in unconstitutional means (Powell and Thyne 2011).

## Introduction

Military coup in different countries has its history since a long time ago. In many countries across the world, military coups are more frequent, and there have been so many successful coup attempts (Connor and Hebditch 2008), for instance, in the political history of Pakistan. It is also worth to mention that a political and administrative reform as a result of these coups in many countries around the globe is a noticed reality, when coup leader attempts to introduce meaningful reform or changes in order to remain in power for long. In some countries, for instance, at the end of dictatorship in Portugal, coups brought some positive changes in the governance process, but in most of the cases, coups become curse for democratic governance, as overthrowing power doesn't always follow a bloodless procedure, and from administrative point of view, there are chances of setting up authoritarian government in power though coups. However, the objective of the entry attempts to explore the contextual issues of military coups and its implications for administrative reforms.

## Military Coups in Different Regions

Successful coups or the attempt of coups have existed as long as government has, for example, coups by Roman generals and emperors for imperial succession, with a view to seizing and holding power. From the twentieth century, numerous military coups have occurred in different regions of the world. Incidents and motives of overtaking power by the military have become a common feature of the political history in Africa and in some countries of Latin America and Asia, and it is even observed in Europe and in some pacific countries. In most of the cases, political and economic crisis or political instability triggered changes of the existing government through military coups. The following table shows a list of some countries in different regions of the world which faced military coups (both successful and failed) and coup attempts in the last few decades:

| Year | Coups occurred in countries |
|---|---|
| 1965–1970 | Ghana, Greece, Eq. Guinea, Ecuador, Iraq, Kenya, Libya, Malaysia, Morocco, Panama, Philippines, Singapore, Somalia, Uganda, Zambia |
| 1971–1975 | Bangladesh, South Korea, Sierra Leone, Swaziland, Uruguay |
| 1976–1980 | Comoros, Congo, El Salvador, Guyana, Pakistan |
| 1981–1985 | Bangladesh, Spain |
| 1986–1990 | Burkina Faso, Comoros, Zimbabwe |
| 1991–1995 | Algeria, Armenia, Azerbaijan, Belarus, Burundi, Peru |
| 1996–2000 | Albania, Ecuador, Fiji, Haiti, Ivory Coast, Pakistan, Zambia |
| 2001–2005 | African Republic, Mauritania, Nepal, Venezuela |
| 2006–present | Niger, Burundi, Turkey |

## Military Coups and Administrative Elites

The term "military coup" refers to the military elites who are part of the state apparatus towards overthrowing the current regime. The nexus between military coups and administrative elites has multifaceted dimensions, including both positive and negative linkages. In the case of nonmilitary power transfers, coups are perpetrated by different stakeholders from within or outside the state and, in many cases, backed by the foreign powers. This form of coups includes military to decide whether military will support to make transfer of power successful or oppose to lead the government towards failure. In such events, political and administrative elites are directly or indirectly dependent on the supports by the foreign forces and the military for successful transfer of power. Similarly, civil society coups entail the removal from power of an elected leader through sustained protest, usually with the deliberative interim support of the military (Encarnacion 2013).

It is found that military intervention in the political process involves different political and economic goals. Traditionally, coups have been understood to be caused by political instability (Marinov and Goemans 2013). It's noticed from the past experiences of the military coup that weak political and administrative institutions and ineffective or conflicting role of political and administrative elites create the path to military intervention in the political process. Even without legal or constitutional basis, military intervention in state administration or the process of governance is somehow being supported by administrative elites directly or indirectly, in many cases. Alternatively, military coup leaders maintain link with administrative elites on the likelihood of political instability and economic crises. It is stressed that the political intervention of the military takes a ground reality, when any state is evolved with some determinants, such as lack of awareness in political affairs, faith in strong military, imminent internal and external security threat, failure of governance, and lack of strong leadership that promotes military coups as strong alternative to resolving the current weak or conflicting governance setup (Khan et al. 2018).

There are times when a coup may be supported and welcomed by different stakeholders in a state, especially, when ordinary citizens see the coup necessary for an improved political and economic environment. In such cases, coups are considered by people as the result of political fault, not the result of military interest (Leighton 2010). The question regarding whether any coups are good for democracy, to illustrate the issue, may be highlighted that some coups are treated as *democratic* that acted against an authoritarian or totalitarian regime. It is stressed that when the military supports or bring back democracy in a country, that is considered as *democratic coup*. However, it is commonly perceived that the military coup always smashes democracy, but in some cases, they support the persistent popular opposition against any authoritarian or totalitarian regime, when despotic ruler refuses to step down in response to the popular uprising, for instance, 2017 Zimbabwean coup d'etat. Furthermore, the coup is highly respected within a state, when the military facilitates free and fair election within a short time and ends with transfer of power to democratically elected leader.

Though there are some instances like these *democratic coups*, the other part shows that large numbers of coups are typically occurred and bring personified intervention and do not make any changes in the political structure. Given the context, autocratic political leaders are simply replaced by military leaders, and there is chance to have another autocratic leadership in the seat. Added to that, arbitrary power of the military rulers might be concentrated in single hand, which might be catastrophically turned into another authoritarian leadership for a certain period of time. However, there are numerous examples showing that administrative elites overlook dictatorial decisions or practices which resulted as negative effects on the states, and the administrative elites become beneficiaries for being allies of military regime.

In any coups, if the military plays an increasingly assertive and influential role in governance affairs, the ultimate result is no good, as it becomes the system by itself rather than the exception or short-term solution. Martial law becoming the norms in the long run might set its focus over self-interest, which spoils consensus oriented or democratic idea of governance. This condition might open the path towards further coup and increase the possibility of political and administrative unrest in a state.

Administrative elites have their crucial roles to play either through assisting or opposing to any form of coup. Based on different cases in different regions across the world, there are the many forms of interaction between administrative elites and the military regarding a coup: firstly, the nexus between administrative elites and military leaders might be established and maintained during a coup or during the military government, while politicians have a minor role at that time. Secondly, in short-term or transitional military rule, administrative elites may play major roles in political affairs through handling regular government functions, supporting the military rulers to fix imbalances created through the coup, or assisting the rehabilitation of democratic governance. Finally, administrative and military elites are in highly influential or dominant position, while leaving politicians with peripheral position to gain government power (Greenwood 1970). There is another chance that while keeping administrative elites in minor position in power and low importance in decision-making process (Groll 2014), administrative elites in minor or subsidiary roles are due to the result of established alliance between the military and political elites; however the long-term importance of political education perpetrates the ground for politicians seeking power in order to take government control.

## Military Coups and Its Implications for Administrative Reforms

The question is about whether a coup can ever be democratic. Some studies show that there are some positive changes made by the military coups in different countries, like coup d'etat in Niger in 2010 that was taken as a positive change maker for the country's democratic future. Not only is this a case, but also in many cases it has been noticed, for instance, "from 1950 to 1989, 14% of successful coups against dictatorships led to democracy within two years, while 40% did so from 1990 to 2015" (Derpanopoulos, et al. 2016). These data help to generate the idea that coups can be a successful tactic for establishing or regaining democracy and development in the political process. It is found that autocracy has been replaced by democracy through a coup for restoring democracy, and there have also been associated administrative reforms and changes as an aftermath of such event. Some possible results of coup are explored, which includes transition of the existing regime to more democratic practices, furthermore, replacing of dictator by a new one, and finally establishment of democracy through ending dictatorship. As a part of the regime change, leadership of the existing regime is transferred or restructured; alternatively, civilian dictatorship might be replaced by a military dictator or by a group of autocrat through a coup.

However, in the case of any event mentioned above taking place through a coup, the main purpose of any coup is to transfer and transform the existing formula of governance or the existing leadership. Immediately after each coup, military

ruler establishes new political agenda setting, which includes administrative or political elites of that country. At present, numbers of countries are governed by the ruler with military background, and a very common scenario about coup makers or executioners became part of the government, for instance, in Cuba, Pakistan, Libya, and Sudan. At the same time, it is perceived from the previous experience of coup d'etat countries that coup makers may be the necessary evil, if successful coup works out for the better outcome in the democratic practices. In such cases, public perception indicates coup as the savior of the nation from despotic rule, which helps the executioner to have a life with a period of time and chance to be part of the elites of governance process.

Coups with a view to restore democracy have a desire of organizing credible election as an aftermath of the incident, which is a positive continuum of military coups (Elischer 2017). Also there is another chance that, "the longer the country remains in a coup spell, the less likely it is to adopt election" (Powell and Thyne 2011), because of ruling government's decreasing popularity and being worried of competitive election. But free and fair election is an effective means of building legitimacy; through these elections legitimate political elites form the government.

In another perspective, a coup can act as a prelude to the new form of despotic rule. In such scenario, a dictatorship is replaced by another dictatorship through a coup; there is always a probability of repression taking place, while repression is lower after failed coups, and it becomes higher, if new dictator is in power, and chance is less in case of democratizing of government, as democratically elected political elites have their responsibilities and mandates for public welfare.

## Conclusion

Governing a state requires a balanced situation where the process of governance is maintained by all the relevant stakeholders, such as civil or political, administrative, and military or defense sector. Whether the coups are successful or not, it depends on the quality of support provided by political and administrative elites; however, there is no denying of the fact that the practices of coups are unconstitutional and undemocratic, which is undesirable for any state. At any stages of coups (in pre-coup, during coup, or post-coup situation), civil or political elites, administrative or bureaucratic elites, and military elites must play their role to gain or regain democratic governance; otherwise curse of autocracy may be established in the long run. However, a popular form of governance is desirable for the states in order to ensure quality practices of democratic principles; therefore, consolidated actions of the different stakeholders who are involved in the governance process must be supported by the aforementioned power elites.

## Synonyms

Blow of state; Coup d'état; Military intervention; Military putsch; Regime change

## Definition

A coup d'état is the sudden, often violent, overthrow of an existing government by a small group, and it usually refers to military coup.

A military coup is "the removal or the attempted removal of a state's chief executive by the regular armed forces through the use of threat of force" (Thompson 1973, p. 6).

## Military Coups

The military coup d'états have accounted for nearly 200 regime changes in the developing world, making it the most common method of regime change in the post-World War II era (David 1991, pp. 238–239). Between 1945 and 1976, Nordlinger (1977, p. xi) estimated more than two thirds of the countries of Latin America, Asia, Africa, and the Middle East had experienced varying levels of military intervention. According to Ruth Leger Sivard's study (1986, p. 24), a majority of third world countries were characterized by military controlled governments in 1985, nearly half of them in Africa which recently freed from West's colonial rule. During the 1950s and 1960s, a coup or attempted coup occurred every 4 months in Latin America, every 7 months in Asia, every 3 months in the Middle East, and every 55 days in Africa (Bertsch et al. 1978, p. 431). Between the 1946 and 1970 period, 59 states experienced a total of 274 coup d'états (Thompson 1973, p. 6). Looking at the period between 1945 and 1985, David (1987) noted that more than 350 attempted military coups took place between and of these attempts, 183 coups (or 51%) were successful (pp. 1–2).

By the end of the 1970s, an enormous body of literature on the causes and outcomes of military coups was, therefore, generated (Eldem 2013). Broadly speaking, students of civil-military relations have advanced two general explanations regarding the causes of military coups: one organizational and the other structural. Those at the level of the military organization underlined the military endogenous variables, such as officers' motives (Horowitz 1980) military role beliefs (Fitch 1977, 1998; Nunn 1976, 1983), and corporate interests (Nordlinger 1977; Perlmutter 1977) that "push" or "motivate" the officers to involve in politics. Those that focus on conditions in the larger society and polity argued that structural factors such as "weakness of governmental institutions and leadership" (Danopoulos 1992, pp. 4–5), low levels of political institutionalization (Huntington 1968), "regime vulnerability" (Thompson 1975), dependent development and socioeconomic crises (O'Donnell 1986), and

political culture (Finer 1962) "pull" the armies toward politics and create "opportunity" for the military to intervene.

On the organizational level, military role beliefs are considered as the most important endogenous variables shaping officer corps' predisposition to intervene. Narrowly speaking, role beliefs refer to "military conceptions of their role in politics"; broadly, they include "the entire complex of attitudes that define officers' normative models of civil-military relations" (Fitch 1998, p. 61). Although empirical evidence of professional officer corps' political activism conflicted with Huntington's (1957) straightforward and somewhat tautological association of military professionalism with apolitical military, his emphasis on "the ethic that governs the relationship between civilians and the military" is considered to be the basis of the military's disposition to intervene (Bland 2004, p. 30; Feaver 1999, p. 226; Fitch 1977, 1998; Nunn 1976, 1983, 1995). Students of civil-military relations in Latin America showed that "the professionalization of many South American armies at the beginning of the twentieth century helped the military institutions to elaborate the idea that they constituted not only the main defense of national territorial integrity, but were the main protectors of inalienable national values" (Silva 2001, p. 4). These historical role beliefs of defending "la patria" (the nation or fatherland) against both internal and external threats motivate militaries to participate in politics when they perceive that governments have put la patria at risk (Loveman 1999).

Military's corporate interests, i.e., the desire to protect or enhance the armed forces' resources or position," are often considered as another endogenous variable providing organizational motivation for the military's involvement in politics (Needler 1987; Nordlinger 1977, Perlmutter 1977). This literature showed that most professional officers place a higher value on the survival and effectiveness of the military itself than on anything else (Geddes 1999, p. 126). Officers also value the territorial integrity of their nations and internal order, but the effective pursuit of these goals requires unity, discipline, and sufficient resources (Stepan 1971; Nordlinger 1977). Nordlinger, therefore, argues, for instance, "the great majority of coups, are partly, primarily, or entirely motivated by the defense or enactment of the military's corporate interests" (1977, p. 78). These threats to corporate interests include cutting the military budget, interfering in military promotions, and creating rival security forces (Ibid., Needler 1975). Colton agrees that officers in Soviet Union "intervene against civilian authorities when their perceived interests are being denied or threatened by civilian policy" (1979, p. 240).

The empirical global evidence, however, suggested otherwise. William Thompson's extensive statistical study encompassing 274 military coups that took place in 59 states between 1946 and 1970, for example, shows that corporate grievances played a role only about 43% of the coups (1973, pp. 50–51). Thompson also showed that the types of military grievances present in the instances of coups are also evident in states that do not experience military interventions; grievances alone, therefore, cannot explain a military's propensity for undertaking a coup. In his survey of Ecuadorian coup participants, Fitch (1977) similarly demonstrated that the interests of the military constitute neither constant nor unanimous factors in coup decisions. The literature also revealed a weak relationship between a military's material corporate interests and coups outcomes. Gary Zuk and William Thompson (1982) have examined the 1967–1976 military spending patterns of 66 less developed states and found that military regimes do not increase the size of their budgets following a coup. Growth in military spending of military regimes is not distinctive compared with that of mixed and civilian regimes (p. 66). Even more interestingly, "the greatest decline in proportional military spending took place within the military regime group" (p. 66). As a result, Zuk and Thompson concluded that there was little support for the hypothesis that military coups accelerated the growth of military expenditures and, consequently, little empirical evidence to support a theory positing that militaries sought primarily to defend and advance their material corporate interests (pp. 71–72).

The structural approaches focus on domestic factors which emphasize perceived crisis resulting from underdevelopment of civilian political institutions and power vacuum in shaping the level of military's political activism. Traditionally, the problem of the coup d'état has been viewed as a weakness of governmental institutions and leadership. Military interventions tend to occur when democratic institutions fail to settle political crises and when civilian government prove unable to govern effectively, cope with security threats, and address major social and economic concerns. The military enters the resulting "political vacuum" in order either to force a popularly desired change of government or to save a crisis-ridden political system (Danopoulos 1992, pp. 4–5; Thompson 1975). According to the theory of praetorian politics developed by Huntington in his seminal study of *Political Order in Changing Societies*, coup proneness typically is the result of "political systems with low levels of institutionalization and high levels of participation" (1968, p. 80). Huntington argued that "the most important causes of military intervention in politics are not military but political and reflect not the social and organizational characteristics of the military establishment but the political and institutional structure of the society" (1968, p. 194). Huntington, therefore, considers the military's political activism as characteristic of the weak, institutionalized praetorian polities in which not only the military but all sorts of social forces such as labor unions, businessman, clergy, and universities engage in politics. "Countries which have political armies also have political clergies, political universities, political bureaucracies, political labour unions, and political corporations" (Ibid.). What causes such groups to become politicized is the absence of effective political institutions capable of mediating, refining, and moderating political action. In the absence of effective political institutions "each group employs means which reflect its peculiar nature and capabilities. The wealthy bribe, students riot, workers strike, mobs demonstrate, and the military coup" (p. 196). Military interventions are therefore nothing but a "specific manifestation" of "systemic frustration" (p. 55) that stems from "the general politicization of social forces and institutions" (p. 194). In sum, an absence of political institutions and leaders capable of ameliorating conflict between various social forces creates favorable conditions for a military intervention. In his analysis of 108 countries between 1948 and 1967, Hibbs reached a similar conclusion that "institutionalization alone has a negative impact on coups.... Weakly institutionalized societies, then, are far more likely than those with highly developed institutions to suffer ... political interventions by the military" (1973, p. 102).

The socioeconomic crisis has been underlined as other important structural causes of military coup d'états. The literature on Latin American democratic breakdowns has shown that in most cases, military coup d'états were preceded by socioeconomic crisis, which according to many were clearly related to the problems of dependent development. According to O'Donnell, (1) an economic crisis, originating from the exhaustion of the "easy" stage of the import-substitute industrialization; (2) a sociopolitical crisis, associated with the increased "level of threat" posed by the politically activated urban popular sector; and (3) the formation of informal alliances composed of civilian technocrats, internationalized bourgeoisie, exporting groups, and foreign capital to counter the popular mobilization, were given rise to the formation of military-controlled bureaucratic authoritarian regime in Argentina (1966–1973 and 1976–1983), Brazil (1964–1985), Chile (1973–1990), and Uruguay (1973–1985). Several scholars have shared O'Donnell's emphasis on the formation of civil-military alliances and the importance of civilian appeals to the military for the formation of a coup coalition and the actual execution of coups in South and Central America (Stepan 1971; Wiking 1983; Finer 1988; Hibbs 1973; Luttwak 1968). Despite the common perception of the bourgeoisie as a democratizing force (Moore 1966, p. 418), the empirical research on late industrialized countries show that authoritarian military regimes have often been established with the support of bourgeoisie (Rueschemeyer et al. 1992, p. 271). As O'Donnell (1973) explains, the perceived

threat from the left – coupled with the economic crisis associated with the exhaustion of the initial/ "easy" stage of import substitution industrialization (ISI) and the need to control labor in order to permit greater accumulation for a capital goods sector – led business elites to support the formation of bureaucratic authoritarian regimes coups in much of Latin America. The position of business elites was similar in Central America (Howard 2002). As Huber explains dissident elite sectors and the emerging middle classes appealed for military support in their efforts to gain a share of political power, while the ruling groups frequently relied on the military to squash such challenges (1988, pp. 45–46). Such appeals to the military were frequent during the period of restricted democracy in Argentina, Venezuela, and Peru where various elite sectors lacked strong parties as instruments to protect their interests (Huber 1988, p. 48). The Brazilian coup was similarly "enthusiastically supported by most of the Brazilian media," as well as by bar associations and religious organizations (Skidmore 1988, p. 27).

The most well-developed explanation of military's political activism that combines both military's organizational and broader structural variables is offered by Samuel Finer (1962) in his seminal work *The Man on Horseback*. Finer argued that not only a disposition within the military to intervene in politics (military role beliefs legitimizing a supra-political status and/or threat to national corporate or individual interests) but also an opportunity to do so (legitimacy of such an action) is required for intervention to succeed. Finer, therefore, identified the *political culture* of the society as the key variable in a nation's civil-military dynamic and concluded that civilian control of the military is strongest in those societies with a well-developed political culture. Finer outlines four types of political culture – mature, developed, low, and minimal – distinguished by varying degrees of the public's acceptance and participation to civilian institutions. The level of political culture is considered "mature" when: (1) the political formula justifying the ruler's right to rule is widely accepted, (2) the political system's civil procedures and organs are widely recognized as worthy of authority, and (3) the public's participation and loyalty to the political system's institutions are intense and widespread (p. 87). Finer argues that in those countries with a high political culture, even disposition (or "mood") to intervene may exist; the military, being aware of the legitimacy of the civilian institutions, will refrain from to do so. The typical mode of military's political activism would be restricted to influence. Those countries with a low culture where the public is narrower and weakly organized and the institutions and procedure of the regime in dispute, the question of legitimacy would be less important. Those countries would, therefore, be more vulnerable not only to military pressure and blackmail, but also to direct military intervention. Since Finer's pioneering work, there emerged a consensus in the literature that the military's decision to intervene in politics is a function of the military's ability to justify the action and thus depends on popular support for a military action (Wiking 1983; Belkin and Schofer 2003; Finer 1988; Powell 2012). It is now generally accepted that the nonmilitary roles that the militaries adopted were not simply based on the military's organizational culture or corporate interests but equally on the broader political culture, which provides varying levels of legitimacy to military's political activism (Koonings and Kruijt 2002; Lowenthal 1986; O'Donnell 1986; Needler 1978; Maniruzzaman 1992). "[u]ni-causal explanation of coups, whether focusing on factors endogenous or exogenous to the military" are therefore found "unconvincing" (Sundhaussen 1984, p. 545).

## Military Withdrawal and Democratic Transitions

Starting with Portugal in 1974, the armed forces of many South European and Latin American countries began withdrawal from direct rule and return to the barracks, transferring power to civilians (Huntington 1991). This "global democratic revolution" shifted scholarly focus away from military coup d'états to the study of military withdrawal and from democratic breakdowns to

military influence developing under democratic auspieces (Pion-Berlin 1990). The literature on military withdrawal identified that the conditions favoring military disengagement were simply the reverse of those that triggered coups in the first place (Luckham 1991, p. 16). Military withdrawal is, therefore, considered as a kind of "intervention in reverse" (Maniruzzaman 1987, p. 29; Finer 1985, p. 23; Needler 1980, p. 622). The literature on military withdrawal has shown that a military's return to its barracks requires both willingness on the part of the military to leave or lessen its participation in government (motivation) and the existence of societal and political forces both to urge them out and take their place (opportunity) (Sundhaussen 1984, p. 550; Barkey 1990, pp. 169–192). Military's corporate interests shape the disposition of the military to withdrawal from politics. Military withdrawal from politics when they perceive that extending their direct rule can damage their institutional prestige, social standing, and internal cohesion (Danopoulos 1988a, p. 11). One of the most widely accepted generalizations about transitions in Latin America is in fact that "there is no transition whose beginning is not the consequence – direct or indirect – of important divisions within the authoritarian regime itself" (O'Donnell and Schmitter 1986, p. 19). In cases where military coups produce military regimes, Barbara Geddes (1999) has argued that corporate interests push the military back to the barracks, creating factions and splits within the leadership (p. 120). The Brazilian, Peruvian, and Panamanian militaries had, for example, withdrawn from politics in the 1980s to protect the image of the military institution in their respective countries. The officers in these militaries felt that prolonging their stay in power through the use of brute force would harm the interests and image of the armed forces and therefore pushed for withdrawal and restoration of civilian rule (Danopoulos 1988b, pp. 18–19). In Argentine, tensions between the military as an institution and the military as a government had started in 1980 already (Stepan 1985, pp. 329–30), were aggravated by the severe economic crisis generated by the government's policies, and were completed through the disastrous launching of the Falklands War. In Greece, the process of transition was triggered by the loss of Cyprus war in July 1974 which created splits within the anti-communist right-wing bloc (Verney and Couloumbis 1991, p. 109). Kim's study (2012) on the South Korean military similarly demonstrates how the lack of intra-military cohesion resulted in the military's inability to block the transition to democracy. A highly politicized system of military reshuffling under South Korea's military rule (1979–1993) had created discontented officers who came to see political transition to democracy as a viable means of replacing those in power.

## Conclusion

The review of literature on military coups and withdrawal shows that military role beliefs and military's corporate interests form the military motives that predispose the military to either return to its barracks or stage an intervention. These predispositions are then shaped by political opportunity structures. Conditions advantageous to democratic consolidation are also conditions favoring the military's disengagement from politics. The literature suggests that the armed forces are more likely to disengage from politics when strong political leadership emerges, economic conditions improve, and civilian support for the military declines. We can therefore conclude that the strength of political leadership and the level of military's popular support partially determine domestic political opportunity structures. However, domestic political opportunity structures are also impacted by factors present in the structure of the international state system. The proliferation of new nations and ideologies in the twentieth century combined with the superpower rivalry of the Cold War had created a favorable atmosphere for militaries to intervene without international sanction. In contrast, the twenty-first century witnesses the rise of discourse of liberal democracy and the emergence of norms of democratic control of armed forces. Combining with international conditionality of reform, this changes the domestic balance of power in favor

of civilians and thereby creates an unfavorable atmosphere for military coup d'etat in the post-Cold War era. The recent literature on military coups propelled by prominent military interventions in places such as Thailand (2006; 2014), Egypt (2013), Mali (2012). Honduras (2009), and Niger (2010) show that since the end of the Cold War, there has been a significant increase in the frequency with which military coups generate democratic regimes since coup-makers face international pressure to hold competitive elections (Marinov and Goemans 2014).

# Military Ethics

Manfred F. Meine and Thomas P. Dunn
Troy University, Troy, AL, USA

## Synonyms

Ethical warfare; Military ethic; Military ethical challenges; Organization evil; Organizational ethics climate; Professional ethics

## Introduction

Societal concern regarding military ethics predates modern history, with writings on the topic dating at least as far back as the Peloponnesian Wars. Despite numerous changes in focus throughout the centuries, any discussion of military ethics has always been, by its very nature, an inevitably complex and frequently contradictory

process, in large part as a result of the typical actions not only expected but routinely and universally required of a professional military. In essence, military forces are to defeat an enemy primarily by taking lives and inflicting destruction, which in itself could be considered an unethical undertaking despite often being arguably justified by so-called just war or national security, or more provocatively as Von Clausewitz suggests in his treatise *On War*, for political ends. The seminal question then becomes how best to institute and enforce an appropriate and acceptable level of organizational ethics and individual ethical behavior in the continuously and rapidly evolving environment surrounding the strategic and tactical conduct of military operations and, ultimately, war.

Even with no realistic possibility of such a controversial position ever garnering universal consensus in the United States, much less internationally, it still seems reasonable to argue that developed countries have progressed significantly beyond previous eras when "rape and pillaging" by the victors was not only reported to be commonplace but even encouraged. Despite such progress since the earliest of recorded history, instances of undesirable actions and behaviors have typically been recorded in all conflicts, especially during World War II, as recently evidenced by the international news media focusing on the question of additional apologies being demanded of Japanese leaders for events during World War II over 70 years ago.

Internationally, the impetus for change in the modern era was the carnage of two World Wars which led to the modern Geneva Conventions and the Laws of War seeking to regulate even the types of weapons and ammunition that may or may not be used in an effort to reach a more humane approach to warfare, if, indeed, "humane" is ever appropriate for use in the same sentence as "war." Unfortunately, despite such laudatory, humanitarian efforts, there has typically been no shortage of so-called war crimes on all sides of military conflicts worldwide. As such, it is understandable that there should be a strong and unrelenting focus on ensuring the most ethical organizational approach to military operations as well as to the behaviors of individual military personnel generally and specifically in time of war.

While military ethics training in the United States had previously centered on moral issues per se, the Vietnam Conflict in general, and the events surrounding the My Lai massacre and ensuing cover-up in particular, sent shock waves through the system and were clearly the primary catalyst for a significant focus change initiative to include elevated expectations for and scrutiny of ethical leadership. Dealing with military ethics, however, requires more than concern about ethical military operations in war but needs to include a focus on other military operations, such as the fight against non-state-sponsored terrorism, and also on the behaviors of military personnel internal to their organizations. As such the ensuing discussion will examine not only the historical and contemporary perspectives on military ethics but will also include speculation as to the future challenges. To clearly understand the various aspects of military ethics, Bryant typologies may be useful to reach clear definitions of the necessary focus areas of military ethics across cultures.

## Definitions and Theoretical Contributions

### Individual Ethics

While all ethical or unethical behaviors involve actions by individuals, the discussion in this category centers on behaviors involved in individual interactions, or as Bryant suggested, intra-occupational actions. As such, sexual harassment or assault by one individual on another would belong in this category, as would lying, cheating, or stealing for personal benefit.

### Organizational Ethics

As noted in the previous category, all behaviors are enacted by individuals, but when organizational cultures or climates allow, support, or even encourage ethical or unethical behaviors, it would seem legitimate to assume that a significant number of "individual behaviors" are a derivative

of the prevailing organizational ethics. An example might be directing, encouraging, or allowing falsification of records or reports to present a more positive picture to superiors or the public.

### The Bryant Typology

In his treatise on crime and deviance in the military, Bryant produced a classic typology of occupational deviance, some of which may be useful in providing definitions of certain aspects of military ethics. His categorizations of criminal behavior in the military, namely, intra-occupational crime (crimes against persons, property, and performance internal to the military setting), fit certain aspects of the individual ethics question related to such issues as sexual harassment and other individual interactions or behaviors. His typology of inter-occupational crime, which focuses on actions toward the enemy military and is related to crimes involving performance of mission-oriented duties, may also be useful in examining organizational ethics climates in the way military organizations deal with opposing forces in general and prisoners of war in particular (Bryant 1979).

### The Danger of the Mission Focus

Military organizations are known for and expected to have a very strong mission focus; however, there is an inherent danger in allowing even such a crucial focus to become excessive since doing so can lead to actions, including unethical actions, to present a positive picture of mission accomplishment or success, for which the body count mission focus during the Vietnam Conflict is a prime and disconcerting example.

### The Danger of the Career Focus

While the mission question focuses on organizations, individual career focus deals with individuals seeking to act in their own best interest. Here too there is the danger of an excessive focus on individual success sometimes encouraged by the so-called zero defects mentality related to career progression, even resulting in officers cheating on exams related to nuclear missile operational proficiency. Career focus can also influence the aforementioned mission area since leaders can influence organizations to take actions or avoid actions simply to protect their own career goals.

## Milestones

### Racial Integration

While racial tensions and perceived injustices continue to plague American society, the US military may well have come a long way in setting the example for society as a whole. Despite early resistance, including the inevitable accusation of inappropriate "social engineering" and additional difficulties along the way, since President Truman ordered the integration of the military services, overall integration can be viewed as an ethical triumph, with career advancement and senior leadership positions fully available to all. A beacon of the success of that effort might well be former Chairman of the Joint Chiefs of Staff and former Secretary of State, Colin Powell.

### Gender Integration

Gender integration may well be a second significant and positive ethics milestone, albeit an unfinished one. Once again the military has set the example for society as a whole with integration of women from the previously separate women's organizations in the services such as the Army's WACS, the Navy's Waves, and the Air Forces WAFS to full inclusion of women into most military occupations, even into the once unthinkable submarine service in the Navy. While there are positive factors for women in the military, to include being paid the same as men for the same work and being generally afforded identical advancement opportunities as men, some limitations continue, with women still being excluded from certain fields. Thus, despite significant successes, the continuing restrictions for women in direct combat roles, such as infantry and armor roles in the Army and Marine Corps and many special operations jobs in all services, may limit their career opportunities. The good news on the other hand is that there are ongoing and unrelenting efforts to open additional if not all of the jobs

to women if they can meet the universal standards. Toward that goal, what has been touted as a major step forward is the experiment of allowing a number of women to enter Army Ranger training as a pilot program, leading to the successful completion of the physically difficult and mentally demanding ranger training course by the first two women, which has already led to the opening of the Ranger School to Army women in general – despite their continuing exclusion from full-fledged ranger organizations, at least for the moment.

### Alternative Lifestyles in the Military

The question of alternative lifestyles in the military, now generally typified by the lesbian, gay, bisexual, and transgender (LGBT) communities serving in the military, while showing some successes in addressing ethical questions of fairness and equity, is still a complex one with the inherent inevitability of more challenges in the future. In the not too distant past, "coming out" or being accused of being a homosexual would generally end any realistic opportunities for advancement in a military career and often lead to discharge. During the Clinton administration, efforts to live up to campaign promises led to the infamous "don't ask don't tell" approach to homosexuals being able to serve. This rather hypocritical approach of allowing people to serve as long as they did not reveal their sexual orientation, nor permitting any relevant inquiries, still meant that military personnel would be discharged from the service if they acted upon their orientation, or if the information about that orientation came to light. During the Obama administration, it seems the question may well have been settled, with the military recognizing same-sex relationships, including marriages, and providing benefits to same-sex partners. Although time will tell what the long-term effects of this policy might be, the change in the military of allowing openly gay individuals to serve seems to have been accepted, with little or no overt resistance, throughout the armed forces and with limited problems being reported. As such, one could justify drawing a tenuous conclusion that this historic and contentious issue may have finally been resolved.

## Past Dilemmas and Problems

### The Vietnam Legacy

Although the Vietnam War may well be just an unsettling memory for many Americans, it remains a topic of both pragmatic interest and scholarly inquiry, which, on both dimensions, certainly serves to legitimize a discussion of events during that distant war and its enduring legacy as viable contributors to an understanding of contemporary military ethics. The phenomenon of war leading to individual and organization deviant behaviors was certainly in evidence during the Vietnam Conflict, and much of the problem can likely be attributed to the establishment of "free-fire zones" which then became the de facto justification for the indiscriminate killing of numerous unarmed civilians resulting in part from the widespread "body count" mentality that became a measure of success for operations and the performance of commanders in Vietnam. The numerous incidents chronicled in books such as *Kill Anything that Moves* and *The Tiger Force* give credence to suggestions that some military organizations during that war exhibited the signs of organizational evil described in Jurkiewicz (2012) book focusing on that topic and providing support for the posited link between events during the Vietnam Conflict and contemporary concerns regarding military ethics.

The numerous organizational and ethical leadership challenges were clearly not the only issues influencing the military's ethics culture during the Vietnam War. Indeed, there were no shortages of individual ethical problems, possibly the most serious of which being the "fraggings" or killing of officers and noncommissioned officers by their own troops, often using fragmentation hand grenades, thus the term fragging. Drug problems, racial turmoil, and self-enrichment schemes through currency manipulation and black-marketing were also not uncommon.

### The Gulf Wars

While the expectation that events during the Vietnam War should and could have served as a lesson for avoiding such incidents in today's conflicts, events such as the alleged prisoner torture at Abu

Ghraib in Iraq and unacceptable actions in Afghanistan such as the widely reported "Stryker Brigade Murders" have again demonstrated that war inevitably leads to inappropriate events and behaviors, and the challenges of ensuring ethical behavior during armed military conflicts remain. More specifically, the ultimate challenge seems to be that once an enemy is clearly identified, labeled, and most frequently demonized, it requires increasingly strong and proactive leadership to maintain ethical control of military forces encompassed by the stresses of combat operations. Furthermore, when military operations deal with brutal terrorist organizations, such as those currently being conducted in the Middle East and elsewhere, and are also being subjected to intense domestic and international scrutiny on a seemingly daily basis, the leadership challenges at all levels of command become even more pronounced.

## Contemporary Issues

Not unlike its emergence at the end of the Vietnam era, the discussion of an impending hollow force has resurfaced as the military is faced with post-Iraq and Afghanistan drawdowns. While it is important to avoid a zero tolerance or risk aversion mindset among military leaders, the insecurity generated by such force reduction environments can lead to a potentially debilitating unwillingness to take even the most carefully calculated and operationally justifiable chances. As a result, drawdowns and zero tolerance for performance missteps can have a significant impact on performance expectations, evaluation standards, and ultimately on organizational goals and the performance of mission-related duties by individuals. Such stress-producing changes can thus be expected to interface with behavior, potentially resulting in generating unethical responses as evidenced by examples such as the Veterans Administration's falsification of patient waiting times to meet goals and even Air Force nuclear missile officers cheating on proficiency exams to avoid the consequences of no tolerance for failure.

Unethical behavior on the part of military members who are under pressure to meet challenging goals or standards, especially when tied directly to sanctions or rewards, may explain claims that lying on the part of military personnel including leaders has actually become part of the military culture. That point was highlighted dramatically just recently by multiple media reports suggesting that intelligence officials were pressured into "sugarcoating" reported successes in dealing with the most significant modern terrorist threat, the organization referred to as ISIS or ISIL.

### Sexual Harassment and Assault

While the military has indeed made significant strides in gender integration, integration has not been without problems as the number of sexual harassment claims and even sexual assaults, primarily against female military members, has not only escalated but, perhaps additionally disconcerting, especially to those who are held accountable for such incidents, has become a frequent focus of media reporting as well. The fact that even senior military leaders have been involved in such incidents ranging from senior officers pressuring or intimidating subordinates into inappropriate sexual situations to one of the most respected top military leaders engaging in adulterous behaviors does not set an appropriately acceptable and mandatory example for military members at large.

Although putting an end to, or at least minimizing, sexual encounters between superiors and subordinates has become a human relations imperative within virtually all social organizations in both the private and public sectors, doing so among military personnel, regardless of their sexual orientation, is of heightened importance due to the unique level of coercive pressure routinely available to superiors over subordinates and the undeniable necessity of embracing and preserving that authoritarian structure for its crucial role in accomplishing the seemingly endless variety of missions assigned to a modern, professional military. As such, the military will face continuing challenges necessitating ethical leadership in sending the signal to all military personnel that inappropriate behavior relating to

romantic and/or sexually oriented situations will not be tolerated. Strengthening the enforcement of anti-fraternization policies and vigorous investigation and disciplinary actions for violations may help, but also establishing a culture of respect between service members, and especially superior-subordinate relationships, is critical, especially if the military has any expectation of continuing to be successful in circumventing congressional efforts to enter a far-reaching slippery slope by taking prosecutorial and disciplinary actions away from commanders in cases of rape or sexual assault.

### Budgets Versus People and Up or Out

A significant ethical and fairness challenge facing today's military leaders and its members is the specter of continued force reductions, especially as the longest wars in US history are winding down, as the so-called war on terrorism continues unabated, and as the "Russian Bear" is aggressively reasserting itself. While eliminating people when the need for manpower declines is not new, there are ethical issues involved in the manner in which such actions are conducted. In the face of unsustainable budgets, it is understandable that savings are needed, and since personnel costs are such a major component of defense spending, personnel reductions are inevitable. Despite their inevitability, the way reductions are carried out can raise not only significant fairness and equity issues but can also have a significant impact on the way military personnel approach their careers and their duties, to include constituting undue influence on how aggressively they carry out their missions.

Since 1947, the military has relied on "up or out" policies, especially for officer promotions, although a RAND Corporation National Defense Research Institute's report (2005) suggested the establishment of exceptions to such policies, especially for certain fields or positions (a policy shift being studied by the Department of Defense for use in certain instances as part of a broad review of military personnel management policies). As currently applied, up or out policies often cause officers seeking a career to be forced out, sometimes with no retirement benefits, for failing to achieve the required promotions along an expected or required career path. When personnel reductions are added to that process, it is not unexpected that a "zero defects" mentality is difficult to avoid, since promotion and elimination boards have reportedly resorted to looking for any signs in officer's records that would justify either denial of promotion or, even worse, selection for mandatory separation. The post-Vietnam Conflict era was filled with such problems as reductions in force (RIF) were aggressively applied. In contemporary efforts to "rightsize" the force, the ethical challenge for military leadership will once again be how to reduce manpower and cost as equitably as possible, especially in the face of the very difficult operational tempo the military services have experienced since the Iraq and Afghanistan wars, often resulting in multiple deployments over relatively short time periods.

### PTSD and Veteran's Healthcare

Unlike the treatment military veterans received after the Vietnam Conflict, today's military receives significant public support. Considering the operational tempo through the long Middle East conflicts, such support is the ethical thing to do, but post-military support for veterans has not been without serious problems stemming from ethical lapses. The long conflicts in the Middle East especially in the face of new dangers presented by insider killings, improvised explosive devices, and suicide bombings have presented the nation's veteran services with new challenges. In addition to the many thousands of severely injured veterans needing care, a new healthcare challenge that was not fully recognized in previous conflicts has emerged in the form of post-traumatic stress disorder (PTSD). In the face of the many physical injuries and the mental health challenges resulting from PTSD, the Veteran's Administration healthcare system has been overwhelmed to the point of becoming dysfunctional in the eyes of veterans and political leaders. This dysfunctionality unfortunately resulted in some widely publicized unethical actions in hiding backlogs in providing veterans access to the VA health system. Processing veteran's claims for various benefits also resulted in tremendous

backlogs, although the VA now claims significant reductions in those backlogs (VA Webpage 2015, accessed September 30, 2015).

Since the nation clearly owes a debt to those who took up the challenge of these difficult conflicts, it is important, ethically and pragmatically, that veterans and service members receive the benefits to which they are entitled. Considering the financial challenges facing the nation and organizations like the VA, ethical leadership will also be key to achieving success in the future of that effort.

### Force Protection

As if the number of ethical challenges facing the military were not already enough, a controversy has arisen recently in the area of what is often called "force protection," or in other words ensuring the safety of military personnel and their families at home, at a time when terror-linked organizations have called for the targeting of military personnel and their families by so-called lone-wolf terrorists in the United States as well as in other countries in which US forces are stationed. The most immediate ethical question, with extensive long-range implications, for military and civilian defense leaders is what actions should be taken to protect people at home. Military personnel are encouraged to avoid putting personal information into social media, but that is certainly a difficult challenge in today's ubiquitous social media climate. Interestingly, although military personnel are routinely armed with modern, mission-related weapons, when they deploy and especially when they go to war, they are not permitted to carry weapons or ammunition when in garrison. When several military personnel were killed by a lone-wolf attack at a recruiting center and nearby reserve base in 2015, it raised the debate about allowing military personnel to be armed in their workplaces. The Department of Defense has not supported arming troops at home, and while the debate has calmed for the moment, with the number of shootings in the United States and now the added concern about lone-wolf attacks, the debate is likely to resurface and continue indefinitely.

## Future Challenges

### Gender Integration Revisited

As previously noted, significant strides have been made by all the military services in integrating women into ever-expanding roles, especially since from an ethical perspective this has been deemed the right thing to do. The highlighted recent success of the first two women in completing the difficult Army Ranger School has likely given a renewed impetus to the effort to expand the roles of women in the services. On the other hand, as might have been predicted, there are now allegations in public media, albeit denied by military authorities, that women were given special treatment to help ensure their success in the Ranger School – claims consistent with an anonymous report by a Ranger School instructor to one of the authors before such allegations became public. Whether such accusations are merely unfounded "sour grapes" on the part of those resisting the integration of women into such elite roles or if they prove to be true, the ongoing studies, especially for the Army in evaluating standards and the feasibility of allowing women into all forward combat roles, are likely to continue generating additional career advancement opportunities for women. This is especially important since the Middle East conflicts have shown that even when occupying support jobs, women have for years been thrust into direct combat situations. As a result, there is little evidence that women could not engage in all elements of military service successfully if they meet the standards. The word standards of course is the seminal challenge, since it is clear that physically there are differences between men and women. What is not always clear, however, is whether the standards, as applied to certain roles, are in fact necessary to complete the required work, or even if they are indeed legitimate predictors of effectiveness in the performance of those roles. As such, the effort to substantiate the link between standards and job or training requirements or expectations is likely to continue long into the future and may well require overcoming resistance from some quarters because of concerns about the perceived "lowering of standards."

### LGBT Questions

As the doors have opened for women in the services, they now have also opened for gays and lesbians to serve openly. While at this point the success of that effort seems assured, there can be no doubt that it will be subjected to intense scrutiny by critics and proponents alike, especially since there is an inherently related and potentially contentious question looming large for the future, with that question being whether or not the "BT" contingent of the "LGBT" demographic will automatically be accorded the legal rights and military acceptance privileges that have now been won by their "LG" compatriots. For example, will openly bisexual persons be accepted into the military environment in keeping with the newly established legal concepts governing the military service of homosexuals, and how will the military deal with accommodating openly transgendered individuals who volunteer to serve in the military or who may be drafted by a conscription system instituted in the future, and/or how will the services deal with active duty military members who seek to change gender? Will the military support such changes, to include allowing military healthcare to perform appropriate surgeries commensurate with gender change, and, once gender change takes place, will any different standards be applied to reconstituted men and women? There obviously are many challenges still to be identified and addressed successfully as the effort to make military service universally available continues to move forward. Although pondering such challenges does have an undeniably compelling intellectual appeal, their pragmatic ramifications are equally compelling and contain considerably more potentially divisive consequences, not the least of which will be those that emerge when the legal imperatives are deemed by one or more of the primary stakeholders to be incompatible with their steadfast religious beliefs.

## The World's Police and the Never-Ending War on Terrorism

For the future, there is no reason to believe that the ethical challenges faced by the US military will be limited to internal organizational and individual ethical issues but will inevitably involve the increasingly controversial role of the United States as the world's police and its parallel challenge of waging a multifaceted and seemingly endless war on terrorism. The US military is certainly engaged worldwide, but of particular concern for the immediate future is its use of high-tech warfare or, more explicitly, killing at a distance. For example, and not unexpectedly, with drone "pilots" sitting safely at their computers in the United States, controlling high-tech weapons that are being lethally employed thousands of miles away, a host of ethical issues have and no doubt will continue to emerge. Such concerns already include those surrounding collateral damage, the killing of suspected terrorists without trials, the killing of Americans engaged in terrorist activities, and conducting such operations without the consent of the country where they are taking place. It is also interesting (both intellectually and pragmatically) to note that current research is even focusing on creating robot weapons which will not require human input in the decision to engage a target. If such efforts do progress to the point of becoming a realistic possibility, a host of new ethical questions will have to be considered. The rapidly changing technologies used by the military for intelligence gathering and warfare in general are likely to also raise additional ethical questions not, as of yet, even conceived.

## The Military and Religion

One additional challenge for the US military that deserves consideration is the question of the military and religion, a challenge with two potential questions. In light of the war on terror, the first question could well revolve around the treatment and acceptance of military members coming from a religious background which is associated with that war, especially in light of the fact that there has already been a highly publicized incident of multiple killings of fellow soldiers by an insider – not only a soldier but also an officer. Insider killings of US servicemen, reportedly by

allied religious extremists, have also been a nagging and all too frequently recurring problem in Afghanistan.

The second question centers on the military's involvement with religion at a time when religion has increasingly become a target in the effort to ensure an ever more rigid separation of government and religion in other parts of society. Historically, the military has employed chaplains to counsel military personnel and provide them access to church services, and much has already changed from the days of new troops being marched to church on Sundays to the current policy of just making religious choices and churches, albeit government ones that continue to be federally funded, available. And yet one cannot but wonder if the "anti-church and state" movement in American society might not create new ethical challenges for military leaders in the future.

## The International Dimension

To this point, discussion of current and future challenges has focused exclusively on the US military with a singular, intranational focus, but with the current and increasingly volatile state of world events, much of the military's mission is not only external to the United States but necessitates interaction with numerous other nations and cultures as well. As such, as the roles being assumed by women in the US forces continues to expand and as the inclusion of LGBT members moves forward, one can only speculate what challenges lie ahead, especially as US personnel interact with cultures where women are not treated as they are in the United States and where homosexuality and even extramarital heterosexual behavior may still be crimes for which conviction can and frequently does result in severe punishment. To accommodate the sensitivities of such cultures, members of the US forces have already been required on occasion to adjust their behaviors, such as women having to wear covering garb that is not part of their prescribed military uniform and/or having to be accompanied by male service members when appearing in public.

Reexamining the role of women in military services internationally clearly suggests there is much variation, but one point appears to be consistent, that being the fact that women's roles in direct combat have consistently been limited by design, by male-oriented physical standards, or simply by personal choice on the part of female service members. It is questionable if that will change significantly in the near future.

## Conclusion

There is no doubt that a military with a proper ethical culture, being enacted by members grounded in clear and strong ethics-based values and being led by ethical leaders who are bolstered by reliable support structures and potential sanctions for intentional ethical failings, is an essential institution for any modern society. In the United States, the high regard in which the military is currently held, and its intermittent history of being a natural laboratory for social equity, demands nothing less than to preserve, and potentially enhance, the military's crucial status in society. It is through strong ethics-focused structures that proper ethical conduct can become a mainstay in the normative structure of the US military.

Clearly the past, present, and future ethical challenges facing the military services are many, but the key question would seem to be whether enough is being done to address the issues highlighted herein, as well as preparing to deal with those that have yet to emerge. Of particular interest are the increasing calls, at the highest levels of the Department of Defense and throughout the military services, for a stronger emphasis on ethics, professionalism, and values in the military. In light of increasing efforts by military professional development schools and training programs and renewed efforts in military academies on instilling the proper values, culture, and the appropriate military ethic, an unavoidable question arises as to whether these initiatives do indeed have the potential to

accomplish their historically elusive goals, or might there already be evidence indicating a need for more? Considering the recent GAO report somewhat critical of the Department of Defense's overall efforts to date and the efforts of the Senior Advisor for Military Professionalism appointed in 2014 specifically, it is suggested that much remains to be done to continue to build and maintain the proper ethics culture throughout the Department of Defense in both the short- and long-term time frames (GAO 2015). The critical area of focus, which is, in essence, as old as military history itself, is likely to continue to be efforts aimed at maintaining or even improving and then perpetuating and enforcing ethical leadership. If that is indeed the issue, the military is not alone, instead sharing yet another of the emerging challenges confronting any contemporary, complex organization, but within the daunting context of the uniquely dire consequences of armed conflict.

# Military Governance and Trends

Fernando Giancotti[1,2] and Anita Renault[3]

[1]Italian Air Force, Air Force Headquarter, Rome, Italy

[2]University of Rome Tor Vergata, Rome, Italy

[3]OpenText Corporation, Enterprise Information Management, Paris, France

## Synonyms

Collective action; Decision-making; Effectiveness of military organizations; Leadership interaction; Military governance; Social norm and institutions

## Definition

Military governance can be considered as the application to the military field of the broader concept of governance, i.e., according to Hufty's Governance Analytical Framework, a social phenomenon, "namely the processes of interaction and decision-making among the actors involved in a collective problem that lead to the creation, reinforcement, or reproduction of social norms and institutions", formal and/or informal, vertical and horizontal, meant also at resolving conflicts.

## Introduction

To define the fundamentals of military governance and its actual trends today, it is necessary to frame the military dimension of governance. Frequent exertion of violence among humans, documented in proximity of the Neolithic Era and thereafter, shows "organized lethal aggression" as a distinctive feature. The level of

Gen. Giancotti has worked mainly on the conceptual framework, while Ms. Renault has focused on the historical research.

effectiveness, lethality, and organization of this violence has varied greatly through the millennia and within different contexts and historical periods. The so-called traditional or prehistoric warfare was largely at the band and tribal level, with little hierarchical organization and coordinated TTPs (Tactics, Techniques, and Procedures). With the rise of "chefferies," starting about 11,000 years ago, more complex and stratified social systems with specialization of functions in the social body and division of labor, a proper warrior caste emerged and therefore a better organized and led combat force. But only states have then produced proper armies, with a professional officer corps, more or less established TTPs, and a military bureaucracy to take care of support functions, from about 5400 years ago. Throughout this spectrum, military governance had to bring to bear on its "collective problem," i.e., being able to effectively exert violence for scopes involving very high stakes, both a decision-making function and an effective interaction among combatants, also through social norms and institutions.

Very specific of the military function is the criticality of the mentioned stakes. In fact, the military is normally a last resort choice to promote or protect very critical interests, and once a conflict has started, the ultimate ones, like life or death or great sufferance of the people and the most gruesome destruction of infrastructure and wealth. Furthermore, the military people, formal and informal, usually the main actors of any violent conflict, accept "by contract" the risk of losing their lives and of being exposed to the utmost sufferance.

Thus, the prize put on an effective military governance is extremely high or at least is very likely to become so in case of actual conflict. Consequently, the need to establish mechanisms such to promote good decision-making and cooperation among people rather than defection in front of the highest danger is crucial. The decision-making question is related to the skill and knowledge of the military leaders and to the general leadership dilemma of how much a leader should allow and listen to the contribution of collaborators. The cooperation issue instead can be considered a special case of the general conundrum of leadership and the effectiveness of the collective action, i.e., how to promote cohesion and convergence on a collective interest (the military objective) rather than defection toward individual ones, like, e.g., survival of individuals fleeing the fight. Both questions show through history a range of solutions that go from a combination of the most autocratic and vertical decision-making with regular exertion of violence to maintain discipline and a compliance based on fear to very contributive decision-making and a cohesion based on strong consensus. Just to give a very general idea of how these issues have been dealt with through time, it can be helpful to give a cursory look at some hints thereof taken from military history, to enable focusing on nowadays trends, evolving to face the continuously emerging new challenges. The two key highlighted aspects are "Decision-Making" and "Leadership Interaction: Fear or/and Trust." Of course, also quality and effectiveness of the "social norm and institutions" produced by the decision-making process and the collective action are relevant, but as a second order of these primary factors. It must be clear that the abovementioned oversimplified classification is meant only to make a general point about military governance, considering some examples, and it is by no means scientifically based.

## A Few Hints on Decision-Making and Leadership Interaction Throughout History

### Assyro-Babylonian Empire

#### Decision-Making

Recent archival papers have showed that Assyrian kings were often helped by military and other kinds of elites. Though in a vertical relation, these circles have supported the kings in the process of establishment and operations of the Assyrian empire. The kings appointed governors and officials on which they could blindly rely on. Even though the relationship between them and the kings stayed always very formal and never

overpassed the bureaucratic level, officials could approach the kings without bodyguards, which was a concrete sign of trust.

#### Leadership Interaction: Fear or/and Trust

Many archives have showed that the kings led their armies in war. Both Sargon II and Tiglath-pileser III are remembered today as having been very active and close to their men during war campaigns. It is even believed that the King Sargon III has lost his life while fighting alongside his army. Kings were thus very respected by the armed forces which showed clear willingness to dedicate their energy and life in serving them. Nonetheless, according to the culture of the times, punishments were harsh and fear was also a relevant factor in maintaining discipline.

### Ancient China

The Chinese general and philosopher Sun Tzu, in his famous masterpiece "The Art of War," accounts both for decision-making and leadership on troops.

#### Decision-Making

Military leaders make decisions which regularly involve high risks and uncertainty, balancing wisdom and strategic planning to de-risk a battle. Reference to officers does not highlight collaborative decision-making.

#### Leadership Interaction: Fear or/and Trust

Generating a personal relation with his commanders and troops and showing benevolence and love for them is a tenet of Sun Tzu leadership. The effective leader should encourage his troops and always remind them for whom they are fighting for: the people. According to Sun Tzu, the valor of the leader should always be reminded to inspire the army and boost the spirits. The Chinese general's opinion is that if the leader succeeds in treating his people with justice and sending strong signs of confidence, the army will answer by demonstrating willingness to serve him and the country. In Sun Tzu's words, when a general treats his army as sons, men will follow him "into the deepest valley." Notwithstanding that, also in China at the time, punishments were harsh and fear was also a relevant factor in maintaining discipline.

### Ancient Greece

#### Decision-Making

As with many ancient societies, the early ancient Greek military structure was very similar to that of the society and wider political power. Significant to this respect is the election of (aristocratic) Athenian generals by the soldiers at Marathon; in this ancient epoch, the core of the army was composed of middle-class, property-owning hoplites that reflected this less autocratic arrangement through their selection of commanders in whom they placed most trust. Later also, aristocrats were assigned to highest rank of the military hierarchy and expected to take key decisions in concert with trusted generals of noble rank.

#### Leadership Interaction: Fear or/and Trust

The centrality of the phalanx in Greek battles reinforced this idea of mutual support and cohesion while requiring trust in a leader who could rarely be present in the main battle line. This patriotic and cohesive core is celebrated by the willingness of Leonidas' men to stand with him at Thermopylae. For Sparta as much as Athens, this was to a degree the result of the soldiers being representatives and members of the state (through position and degree of personal property). Though by Alexander's time this concept had lost much of its relevance, the achievements of Greece in the Persian wars became an ideal of comradeship and collective action that subsequent Greek armies were supposed to emulate. The wider bonds of morale and collective effort were thus key elements of Greek military culture.

### Roman Army

#### Decision-Making

Command of the Republican legions was assigned to consuls, drawn largely from the top of society, reflecting the political landscape. The army was supposedly loyal to the Republic, an

idea reinforced by the property-owning, largely unpaid position of most soldiers. Command was issued and enacted through a formal hierarchy of staff officers and formation commanders (tribunes and legates). Depending upon the commander in question, this could be a relatively open and horizontal process or highly authoritarian. Caesar's accounts in "De bello gallico" highlight an open discussion among the commander-in-chief and the subordinate commanders to enhance decision-making. One of the key roles that was devolved to staffs was a complex and efficient logistical systems that enabled Roman commanders to campaign longer and more effectively than their opponents. This effective management of supply and reinforcement required effective use of subordinates with independent authority. Despite claims by Caesar and accounts of the young Pompey, commanders were rarely expected to take directly part in battles but rather to command their subordinates and the timing of reinforcement. At the lower level, the centurions were supposed to take the commander's orders and adapt them where necessary and within limits, to address the difficulties of command and control in battles of 50,000 troops on each side. However, it is generally believed to have been a looser form of command and control than that of the Greek armies and therefore more effective under many circumstances.

Under the empire, command at an operational level remained roughly the same, but army commanders surrendered strategic freedom to the ruling princeps to whom they and their men swore direct loyalty. This semi-medieval arrangement became stronger in the later empire, with the emperor himself often taking the field in order to ensure loyalty of the army and its generals.

#### Leadership Interaction: Fear or/and Trust

The Roman army was famous for its strict discipline, but that was accepted by the soldiers as necessary to a degree. It is an early and well-documented case of widespread small unit motivation, with squads (contubernio) bunking and fighting together and the 80-man century organized under their own standards. Personal bravery and aggressiveness, formally and publicly rewarded by army commanders with medals and promotions, were a key driving force behind its success, along with continuous training. The high casualty rates of centurions – who lead from the front – speak to this emphasis on bravery and leadership. A key element of this, whoever – and to some degree reflective of the Athenian phalanx – was the concept of state citizenship; the soldiers were active members of the state, and though their democratic ideal declined, they thought of themselves as representative of the Roman state at war, their future tied to its success and failure. This was though balanced by personal loyalty to legion and army commanders who – through the spoils of their campaigns and their ability to guarantee generous retirement packages for their soldiers – melded their forces into what became effectively personal war-bands. This primacy of loyalty to the commander proved a strong and effective bond between soldiers, their immediate officers, and their general, but as it grew stronger, it was to cause continued damage through ongoing civil wars and ultimately played a strong part in the disintegration of the Republic and subsequently the empire. Military governance had then direct impact on major geopolitical turnovers.

### Medieval Chivalry

#### Decision-Making

Authority to command was founded on the idea of the king as the rightful ruler of society: in this sense it was extremely hierarchical but, in reality, may have been more flexible as capable lower-ranking commanders exercised authority under actual battlefield conditions. However, as feudally raised armies often had greater loyalty to an immediate lord or commander rather than the senior noble or king, the debate and planning process had to offer a degree of inclusivity to powerful nobles in order to retain their loyalty, both at an operational and tactical level. By contrast the lower-ranking lords, their professional knights, and cavalry/archer and their levies had little input but were expected simply to fight as they were told.

### Leadership Interaction: Fear or/and Trust

Medieval command was based strongly on the personal charisma and strength of the commander, either king or nobleman, as well as his ability to generate military power, very much together with his ability to pay and support his soldiers. Command traditionally rested on the personal authority and seniority – essentially his reputation – as well as strength of the forces that he brought to the table.

Most medieval campaigns were relatively limited in scope (the Crusades being a notable exception in strategic movement, if not in the style of command). Armies fought in general under their local commanders, though the further up the social scale, the more professional the combatant and hence likely greater willingness to serve. Pay through spoils of war was an important motivating factor, but loyalty to a lord or house, defense of one's land, and some belief in the righteousness of a cause were all contributory factors. Even though it is not easy to determine to which extent the soldiers felt themselves part of their kingdom, it is reasonable a degree of identification, even if not quite the same as Republican or city-state soldier in the previous millennium.

As with the Roman legions, although lacking their sophistication, leadership and bravery were key and nobles were expected to fight in the front lines. Furthermore, the strength of loyalty – both for mercenary and political reasons – should not be underestimated: medieval battles often lasted the best part of a day and saw very heavy casualties before one side retreated, sometimes retaining good order and discipline.

## The Prussian "Revolution in Military Affairs"

### Decision-Making

The Prussian Army's influence in European military affairs has varied between that of a leading power in the eighteenth century and to humiliating defeat against Napoleon and subsequent formation of a new empire from the defeat of his great nephew in 1870. The strong investment in the buildup of a truly professional military under Frederick Wilhelm the First, the soldier-king, sets the stage for a true military power of the eighteenth century. A strong identification of the military with the kingdom ("an army with a country") reinforced this practice, though governance remained largely traditional and based on the person of the king. The aristocracy, largely outpowered due to the absolutistic monarchy, was channeled and given high status in the militarized state system. Senior officers remained of traditional backgrounds and were too be obeyed based on the faith that the kings showed by their appointment. Famous is the picture "War council of Friedrich the Great," the mythic general, statesman, and king, depicting him listening to his general proposing a battle plan. The defeat by larger and faster moving Napoleon armies drove thinking about combined arms efforts and professional instruction for a broadened conscript army and wider officer corps. Emphasis on flexibility of strategy and operations together with responsibility of junior commanders to develop or exceed orders (the modern example of mission-oriented command) was both a key component of effective leadership. Establishment of a staff, a war academy, manuals for officer, and consideration of technical improvements (weapons, transport) were part of a wider open-minded appreciation of how to maximize Prussian military advantages. Producing and sharing knowledge through a staff for the sake of better decision-making was eventually a Prussian invention.

### Leadership Interaction: Fear or/and Trust

The increasingly patriotic and nationalistic underpinnings of the Prussian nation and army, together with concern over disadvantageous strategic situation, drove the formation of professional, offensive doctrine promised on flexibility and concentration of force against single enemies in succession. Within the army, the message of the nation in arms – as was the case in France – delivered both an expectation of performance and the opportunity for advancement.

The focus on junior leader responsibility, combined with effective generation of the army as a national concept, forged close relationships among lower levels of the army. Emphasis on

collaboration across ranks and units together with the military self-identification as the vanguard of the nation created a strong concept of both citizen and professional soldiers. Emphasis on esprit de corps and aggressive action had generated a positive feedback loop from successes in the second half of the nineteenth century, combined with extremely effective governance and supply of units on campaign. Indeed, these were many of the strengths that had allowed Napoleon victory in 1806. Exceeding Bonaparte's armies, the Prussian force of late nineteenth century had professional command, logistics, signals, and weapons together with a strong sense of vertical and horizontal relationships among units and arms. This combination of the moral with the physical and the technical factors was to prove an extremely strong entity.

## Napoleon's Revolution in Military Affairs

### Decision-Making

The experience of the French and their opponents from 1789 to 1815 represents an important military evolution on many levels. Command was essentially hierarchical, relying on competence and charisma to motivate and guide forces but with a degree of debate and collective decision-making. Though much was later made of the levée en masse and new commanders with revolutionary zeal, the management of the early French Revolutionary armies depended significantly on the existing infrastructure and training of the royal army of Louis XVI. As the old commanders and structures died through attrition, the Republican and Napoleonic armies became more meritocratic (often by necessity) as junior, capable commanders – including Bonaparte himself – imposed their more agile vision of military affairs.

Napoleon's famous victories in his early years were a balance of his personal authority and capability combined with that of subordinates. A degree of council on decisions and the articulation of objectives combined with freedom to – and expectation of – exercise judgment at lower levels to take advantage of developing situations. This challenged the more prosaic command structure of his opponents, emphasizing and rewarding personal leadership and results over adherence to established practices.

### Leadership Interaction: Fear or/and Trust

The French Republic was perhaps the first entity since antiquity that managed to generate a common principle of citizenship and shared responsibility. This tilted heavily the trust/fear relationship toward the first term. Furthermore, Napoleon's policies offered prospects and promotion lacking in other armies to those prepared to take risks and forge relationships with their units, motivating their forces to succeed. The Legion of Honor and rapid promotions exemplified the potential rewards of success, as did – initially at least – the ostensible sharing of campaign hardships among officers and men. A focus on battlefield capability and the opportunity to be recognized and gain the rewards of service were key facets of Napoleonic service. Social position, though not unimportant, was not perceived as a barrier to advancement while the opportunity to be recognized in front of one comrades was a key element of the armies' aggressive appetite and resilience. A well-established structure of command allowed flexible organization at lower levels as well as depth of control should individuals be injured. As with the Caesarian legions, discipline was also relatively fierce, providing the stick alongside the carrot of rewards.

Over time and despite the nominal flexibility and opportunity offered, the Imperial Armies became increasingly hierarchical, though they managed to retain their offensive spirit and confidence owing to the personal loyalty shown by middle- and lower-level commanders to their corps or army chiefs and ultimately to Napoleon himself. As long as the regime met with success, this was sustainable, but as defeats mounted, the reliability of army commanders – his marshals – and their subordinate armies began to decline. Nevertheless, the freedom of corps commanders and the collective input under Napoleon's unassailable position continued to be the main feature of control, even if Ney and Grouchy's actions at Waterloo showed the limits of allowing subordinates to operate with minimal oversight.

## Industrial Age Militaries: World Wars and the Cold War

Even a very simple scheme as ours would require a large book by its own to map the last century of military governance. We try to capture some general ideas from the governance and leadership dynamics of the period, to confront with our previous discussion. The Industrial Revolution produced armies by far larger than any other time, through the related demographic explosion, and equipped with the deadliest killing technology ever seen on the planet. In the age of industrial wars, the twentieth century, a Tayloristic approach to the enormous production of violence and of its instruments aimed at enemy systems could maximize coercion of enemy's will. A rather vertical decision-making for large masses of soldiers together with production of huge amounts of armaments to feed the fight have been decisive. Centralized command and control, more or less open to contribution, could often leave men on the ground with no clue of the reason for their orders. Discipline was harsh and court martial proceedings severe. Decision-making was supported by varying degrees of commanders' discussion in the western democracies while being mainly vertical and authoritarian in Hitler's Germany and Stalin's Russia. The cohesion was tied to a nation-state ideal, until that survived the harshness of the battlefield, and to peer-to-peer bond among soldiers. War was generally seen through the lens of the positivistic culture, as an organized, linear process where power factors were engineered to coerce the enemy's will. Actually, economic power and industrial production were key in winning the war for the Allied Powers. But in sum, notwithstanding the enormous scale of the conflict and its incredible technological leaps, not much in terms of decision-making process and leadership interaction had changed, at least for the mainstream war. They were linked to trust to identities as the state, the nation, and some leaders, based on fear for harsh punishment in case of desertion, with a largerly vertical decision-making process. Varying degrees of shared analysis at the top and some tactical freedom from subordinate commanders were often allowed but also often not. The MAD (mutual assured destruction) paradigm of the Cold War added an absolute new and frightening paradigm change to confrontation, de facto quelling the potential for major conflicts. But even there, no corresponding change arose in governance concepts. Remarkable in a sense was the extreme centralization and verticalization of the Soviet military system, fully discovered after the collapse of the Soviet Union. Its operational and tactical fragility is an icon of the inadequacy of linear, disempowering governance systems posed to confront the "fog and friction" of war.

## Drawing Conclusions: Trends in Military Governance Today

Our very shallow look at some fundamental modes of military governance through history has shown a wide variety of decision-making and leadership interaction approaches and of combination thereof. These ranged from a very vertical, authoritarian stance, though coupled to strong charismatic leadership, deaf to contributions and conductive to disaster, like Hitler's strategic conduct of World War II, to the Israel Defense Force model of horizontal relations and diffused leadership, formally loose but dense of interactive exchanges within clear strategic directives. Identification with the institution (Rome, the Republic of Venice, the country, etc.) or with the leader has often been a pillar of motivation to fight, as loyalty to one's own fellow soldiers. Trust could be established between the leader and the soldiers, within the units, and in both cases in the best circumstances. Fear of punishment has always been in varying degrees a contributor, sometimes the main one, to collaboration versus defection. Social norms and institutions generally followed the lines of the different governance modes. Of course, we shall recall that their effectiveness depended largely on the context in which they had to operate.

Nowadays, apart from the dormant nuclear confrontation, conflicts seem to be much smaller

than the global deflagrations of last century but much harder to understand and manage. The end of the Cold War has opened a Pandora's box of tensions and conflicts, in which the industrial age paradigms show very little effectiveness. What has been called a VUCAR (volatile, uncertain, complex, ambiguous, and rapidly changing) world has deeply changed the challenges that militaries face and thus their governance needs. The new emerging trend for the nowadays effective military governance is still inevitably based on satisfaction of the deep needs of humankind: social interaction, leadership, and values as glue of the collective action. The appreciation of those is today key for a mature adhesion to the mission accomplishment. But also on an agile, decentralized but strongly connected network of people whose bond is trust, rather than fear. It is so because of the key importance of the distributed ability to contribute with information and ideas to the decision-making process and the capacity of individuals and teams to take the initiative when their situation awareness so dictates or when centralized control fails. Those are trust-based actions, apt to contribute enormously to effectiveness in complex environments and resilience in any contested endeavor. The age-old conundrum between trust and fear is thus definitely gone to trust, just like the many different combinations of authoritarian versus collaborative decision-making go definitely toward a cooperative mode. Collaborative doesn't correspond to the definition of democratic political process: military officers are appointed and not elected and bear personal responsibility for the decision taken as a synthesis of the decision-making process. But the analytical phase thereof, collecting inputs from rank-and-file, from operational actors of any relevance, from collaborators and staffs, must be highly cooperative and closely networked. Nor does it mean that defection from cooperation and values should stay unpunished. Sanction stays as deterrence thereof and warrantor of fairness and justice in the system. But it is by no means the main reference of the collective action. In this new world, leadership stays as the mainstay of the operational effectiveness, but its focus moves to trust and network. Leadership today has also the great responsibility and the unusual task to bring together people and technology as a system, since if we know that we will always need the first, we cannot hope to do without the second when networking and speed of information exchange are key to agile and effective answers in a VUCAR world. That implies great opportunities but also new challenges, since system thinking is still unusual among humans, let alone among humans and machines. Opportunity and challenge will be multiplied manyfolds in the next future, most likely well before we generally think, as artificial intelligence will explode as a diffused new tool, with mind-numbing implications, among which its potential to utilize humans as tools for mission accomplishment. Thence will military governance, as actually any governance at all, need to be thoroughly redefined once again.

# Millennials in the Public Workforce

Jessica L. DeShazo
California State University Los Angeles, Los Angeles, CA, USA

## Synonyms

Boomer babies; Generation me; Generation Y

## Definition

Millennials refer to the generation of people who were born after 1980 and reached adulthood in the new millennium. Sometimes, this age range is extended to people who were born at the beginning of the millennium. They follow the group referred to as Generation X.

## Introduction

The composition of the public workforce is undergoing a major demographic shift. The generation of people born between 1946 and 1964, following World War II, known as the baby boomers, are retiring. A new generation of employees are now beginning their careers and becoming leaders in the public sector, the millennials. While we know quite a bit about the baby boomer generation, their impact on the workforce, and their work habits, we know much less about millennials. Since millennials are beginning to make up a larger section of the public work force, it is important to understand millennials and their motivations to work in the public sector, how to effectively manage them, and how to develop their skills and abilities. Since the baby boomer generation is retiring, agencies in the public sector will need to participate in succession planning in order replace those employees who are retiring while maintaining productivity levels. Succession planning occurs when an organization actively plans for the replacement of its top-level executive and senior management positions by identifying potential candidates within the organization and developing their abilities to work at the top level.

As a generation, the millennials have some defining characteristics that will impact how public organizations function and how they engage in succession planning. The millennial generation defies basic stereotypes about their work habits and beliefs. Overall, they have been called a generation that defies description. However, there are some things that can be singled out about this group and their nexus with the public workforce. It is important to keep in mind that this generation has grown up with access to vast amounts of information readily available from computers and mobile devices as well as networks of communication from social media sources. Additionally, this generation has been shaped by the Great Recession. Many of them have seen their parents and grandparents take huge financial losses and in some cases lose their jobs and homes. Society, the economy, and changes in technology have had a great impact on this generation of public employees.

## Motivations to Work in the Public Sector

It is often said that millennials are a "me" generation that is overly concerned with themselves and less with their community and the society in which they live. Why would they then choose to work in the public sector? It would follow that as the "me" generation, they would be more interested in working in the private sector and not in the sector that is focused on serving the public. This is not a correct assumption. Millennials may be concerned about themselves, but they also desire to work in the public sector, including both government and nonprofit organizations specifically because they provide an opportunity for public service. Millennials, like generations before them, are in search of work with meaning and an ability to contribute to the greater good (Ng and Gossett 2013). This could be because of the economic climate of the Great Recession that shaped their view of work and contributing to society. They have a desire for better society and contribute to issues they care about. Millennials want to work in areas that they believe are meaningful.

## Managing Millennials

Millennials tend to desire more balance between work and their personal lives than baby boomers. They are less willing to work long hours everyday of the week just to get ahead in their careers. They would rather have more personal time away from work. For millennials, the ability to have flexible work schedules and telecommuting options are important. While both can be difficult for organizations to implement due to managing the

workload and scheduling conflicts, they provide greater satisfaction for millennial employees who want more work-life balance. Also, not all work in the public sector is amenable to telecommuting or flexible schedules. However, some governments are being more innovative and introducing these formats when possible. For example, many local governments are shifting to a compressed work week, to both save money and increase employee satisfaction. A compressed work week is working the normal amount of hours for full-time employment, usually 40 h, but in fewer days. A common approach to a compressed work week is working 10 h a day for 4 days, which gives employees 3 days away from work instead of two. Such an approach is amenable to millennials because it gives them more continuous personal time.

Other than more work-life balance, millennials tend to need continuous affirmation about their work. They have often been referred to as the "everyone gets a trophy" group because they have been accustomed to receiving positive feedback regardless of their performance. It is the idea that a person receives an "A" for effort. While this may be true, in human resources management, it is well accepted that people perform better in a positive working environment in which they receive constructive criticism and some amount of praise for when they perform a task correctly or perform well overall. Additionally, when training an employee, it is important to provide immediate feedback regarding their work. This helps the employee to understand what they did correctly and what needs to be improved upon. It is a good management skill to use on anyone, regardless of their generation.

There are a few more important points to understand about how to manage millennials. First, this generation uses social media and their personal devices to constantly stay connected with others. While it may seem like a disadvantage, managers can use this to their advantage with group-oriented work. Millennials tend to work well in groups and can communicate with their peers effectively in a professional environment. Second, millennials desire the ability to advance quickly. They are more likely than previous generations to voluntarily leave their jobs in search for higher pay and more fulfilling work. They have less loyalty to an organization and show more loyalty to a cause or mission they believe in and people they work with (Burke et al. 2015). In connection to this point, the millennial generation hold both a diverse and inclusive working environment as being important (Ng and Gossett 2013). This also supports more group-oriented work, and organizations need to maintain a positive working environment if they wish to retain millennial employees.

## Developing the Skills and Abilities of Millennials

Since it is understood that millennials are often seeking meaningful and rewarding work (Ng et al. 2010), developing their skills and abilities should focus more on how their job or role within an organization contributes to fulfilling its public service mission. Researchers are predicting that millennials may become the most educated generation; therefore, organizations can focus less on developing formal knowledge for this generation. The millennial generation seems to learn best through active learning, which requires participation in learning new concepts and skills rather than passive listening. This would make reading handbooks on different processes or skills difficult for millennials to absorb. Instead, teaching new material on the job site would be best delivered through on-the-job training, workshops, or simulations when the previous two are not an option. Additionally, millennials are considered "digital natives," meaning that they have grown up understanding on how to use digital technology. Training of millennials should then focus less on teaching them how to use software and digital technology, and more focus should be on how to effectively multitask with the technology and how to prioritize work tasks.

## Conclusion

Millennials are different from previous generations, especially the baby boomers. However, they still want to contribute to society and work in the public sector. Millennials can be as

productive and effective in public sector work as older generations. As organizations plan for millennials to replace the baby boomers, they must understand the characteristics of the generation in order to maintain productivity and retain their younger employees. Supervisors of millennials must understand how millennials learn, the type of work they desire, and the importance of a positive working environment and working relationships.

## Synonyms

Black owned Business; Disadvantaged business enterprise; Immigrant owned business; LGBTQIA owned business; Minority owned business; Startups; Women owned business

## Introduction

The global COVID-19 pandemic arrived and brought widespread shutdowns to the USA in March 2020, causing reflection on the state of business and information services for minority-owned businesses and startups under constantly changing circumstances. Unlike the 2008 financial crisis, the pandemic immediately affected every aspect of every business and demonstrated that economic health is people's health. Add the prominent killings of George Floyd and Breonna Taylor at the hands of police, the resulting mass protests across the country and the world in support of the Black Lives Matter movement, and it became clear that racial justice would directly impact entrepreneurs and their support systems.

This article examines the historical and contemporary problems and challenges that minorities face when starting or growing a business and highlights some the unique resources and services available to support them along the way.

## Disproportionate Challenges

In the current moment, the impact of deep, long-term wealth inequality is clear. Before the pandemic, minority-owned businesses already faced disproportionate challenges, especially from unequal access to capital and credit. As the pandemic continues, reports indicate that Black- and Latinx-owned businesses are more likely to operate in locations with high COVID-19 levels and that these businesses are less likely to have received Paycheck Protection Program (PPP) relief.

Nevertheless, entrepreneurs of all backgrounds continue to demonstrate flexibility and identify opportunities to adapt and pivot. Buy Black networks and platforms at local levels with worldwide reach online, continue to form, and expand. Additionally, the support networks put in place by different levels of government, universities, and other organizations to address documented challenges facing Black and Brown business owners continue to provide solid support to minority entrepreneurs. Despite devastating estimates of

the impact of the coronavirus pandemic on minority-owned businesses, local and national business news continue to recognize adjustments and pivots that some minority business owners have deployed.

Restaurants and retail businesses around the country have moved to outdoor dining, curbside, and delivery services in response to restrictions and commonsense care for the health and well-being of staff and clients. Some businesses moved to cut costs by closing locations, paring down production, and layoffs or salary cuts. Others identified new niches and evolving needs to serve, such as Black-owned distilleries moving to the hand sanitizer market in response to nationwide shortages of the product. When Black- and other minority-owned businesses have achieved a sufficient cushion of funding to pivot, innovate, and respond to new demands, they succeed in doing so. When carrying the heaviest burden of historic inequities, however, they are likely to falter.

The summer of 2020 brought the Black Lives Matter movement into the mainstream in new ways. Worldwide protests in the wake of police killing George Floyd and Breonna Taylor caused many people to reflect on the disproportionate impact of police violence on Black people. As the wider public becomes more engaged in understanding economic inequality, efforts to support Black entrepreneurship also entered mainstream consumer culture in new ways. Whether Black Lives Matter demonstrators sought to purchase apparel showing their support for the movement from Black-owned businesses or moved their buying power to Black-owned business networks, the market for Black entrepreneurs has expanded.

In urban centers, Black-owned business directories are expanding and becoming more accessible and robust. Mainstream publications and news sources spotlight Black-owned businesses. For instance, Oprah Winfrey's magazine, *O*, usually promotes Black-owned businesses in its annual gift guide, but this year, "Black owned" has become a headline grabbing quality. Consumers of all backgrounds have come to recognize that their buying power can be a tool to address systemic racism, as well as a way to find unique products and services that may not have been marketed to them until just a few months ago.

This article examines the historical and contemporary problems and challenges that minorities face when starting or growing a business and highlights the unique resources and services available to support them along the way.

## Minority-Owned Businesses by the Numbers (Pre-COVID)

Prior to the 1970s, minority enterprises were small in size and often limited to a narrow set of industries. However, in recent years, growth and diversification of minority employer and nonemployer firms has exploded. According to the *Annual Business Survey*, conducted in 2018 and released in 2019, minority businesses account for 18.3% (or one million) of all employer businesses in the USA (United States Census Bureau 2021). By definition, employer firms employ paid workers year-round. This survey, conducted by the United States Census Bureau, provides demographic information on business owners and captures key financial statistics and trends. The survey highlights statistics from each class of racial or ethnic minority recognized by the US government including African American, Hispanic, Asian American, Native American, and Native Hawaiian and Other Pacific Islander and women and veteran businesses.

The top business sectors for minority entrepreneurs were professional, scientific and technical services, construction, healthcare and social assistance, and retail. These businesses employed over 51 million workers and had a combined payroll of $2.6 trillion that year. Hispanic-owned businesses grew to 331,625, up 3% from 2017. Hispanic firms also employed three million workers and had about $101 billion in annual payroll. There were an estimated 577,835 Asian-owned businesses. Asian-owned businesses had the highest receipts ($863.3 billion) among minority groups. Additionally, there were 24,433 American Indian and Alaska Native-owned and 6653 Native Hawaiian and Other Pacific Islander-owned businesses. Of the 124,551 Black-owned enterprises,

28.5% fell into the healthcare and social assistance sectors. Complete statistics can be found in the Annual Business Survey 2019 (United States Census Bureau 2021).

Nonemployer firm data for minority entrepreneurs is not included in the Annual Business Survey. A separate report called *Nonemployer Statistics by Demographics (NES-D*) looks at nonemployer statistics for different ethnic groups in the USA. This data is not collected via a survey, but is compiled linking existing census data to demographic characteristics. This additional data is important to explore for many reasons. Compared to employer owners, owners of nonemployer businesses are younger and more diverse in race, ethnicity, and gender, and about one third of nonemployer businesses are owned by minorities. The nonemployer businesses have no paid employees or payroll, and the vast majority are sole proprietorships.

The most recent release of *Nonemployer Statistics by Demographics (NES-D*) data is from 2017. According to the report, minority-owned nonemployers accounted for about 8.2 million of the total 25.3 million nonemployer businesses (United States Census Bureau 2020b).

## Answering a Legacy of Disparity

Despite rising rates in minority business ownership over the last few decades, many minority entrepreneurs continue to face significant disparities when starting and growing a business. Many of these disparities can be connected to institutional discrimination and racism that have plagued American society since the era of reconstruction.

Historically, minority businesses, more specifically Black businesses, have been the target of state-sponsored inequality and terrorism. There are many examples during the reconstruction period that illustrate a systemic and violent suppression of prosperous minority communities at the hands of White mobs including most notably the Red Summer of 1919 and the burning of *Black Wall Street* at the Tulsa Massacre in 1921. The months shortly after WW I ended are considered to be the bloodiest in American history for White-on-Black riots. Over the course of 10 months, White mobs burned down thriving Black business communities and killed hundreds in major cities all over the country. Known as the Red Summer, this period in time was marred by over 25 race-based riots.

The Tulsa Massacre of 1921 is considered one of the worst assaults on Black business during this time. The Greenwood district, known as *Black Wall Street*, was a thriving Black business community in Tulsa, Oklahoma. This community prospered under a huge oil boom in Oklahoma in the 1920s. By 1921, Greenwood was home to multiple Black-owned hotels and lodges, a public library and hospital, doctor and lawyer offices, banks, restaurants, a movie theater, and the prominent Black newspaper, *The Tulsa Star*. It quickly became the wealthiest African American business community in America and, due to segregation in Oklahoma, was largely self-contained with Black money driving its economy.

A single event on May 31, 1921, would change this community forever. Angered by the alleged rape of a White woman by a Black man, an armed White mob took to the streets. Black residents of Greenwood took up arms against this mob. Being out armed and outmanned, the residents fled to the district. The mob descended on Greenwood, and at the end of the 18 hours, 35 acres of business property and over 1200 homes in Greenwood would be destroyed and 300 of its residents killed and 800 injured.

These types of events became commonplace all over the country over the next decades. While some communities, like the Greenwood neighborhood in Tulsa, were able to rebuild, others were abandoned. Often residents of the communities were not awarded damages through the court system or otherwise compensated. This time in history has had a profound impact on today's racial wealth and opportunity gaps.

The civil rights movement and accompanying legislation sought to address not only the political and social inequalities for people of color but also many of commonplace racially motivated business practices that kept minorities from competing in the free market. The creation of the Small

Business Administration (SBA)'s Section 8 (a) program during this time sought to level the playing field for socially and economically disadvantaged enterprises by requiring that at least 5% of government contracts be awarded to these types of businesses each year (Small Business Administration n.d.). Through a certification process, minority businesses were able to secure business with the federal government. Because of this many small minority firms were able to stabilize and grow.

The creation of the Minority Business Development Agency by executive order under President Nixon in 1969 further illustrated the federal government's commitment to growing America's minority businesses. President Nixon recognized the impact minority businesses have on the American economy and specifically charged this agency with providing support services, funding opportunities, and education initiatives to US minority business enterprises (MBEs) owned and operated by African Americans, Asian Americans, Hasidic Jews, Hispanic Americans, Native Americans, and Pacific Islanders (Minority Business Development Agency n.d.).

Today, however, many of the unique challenges minorities face when starting a business can be linked directly or indirectly to the events and sentiments of the reconstruction and the Jim Crow eras. Some of these challenges include difficulty accessing monetary capital for startup or scaling purposes, lack of access to social capital and business education and experience, and more recently the economic fallout from the COVID-19 pandemic and its disproportionate effects on minority-owned firms.

The success of any new business often relies on the ability to secure and manage monetary capital. Working capital is necessary for building inventory, hiring employees, and customer acquisition. However, studies have shown that minority businesses are less likely than their White counterparts to secure capital through mainstream means. This includes small business loans from traditional lenders like banks. Minority entrepreneurs are viewed as risky investments by traditional lenders due to their perceived lower net worth, lack of collateral, and creditworthiness.

Because of the racial wealth gap, many African Americans and Hispanics have a lower net worth than Whites. This lack of personal finance could mean that when they borrow, they need to borrow more. Having a lower net worth can also mean that you have less high-value collateral for banks and other lenders to collect in the case of loan default. Compounded by lower credit scores on average, minority entrepreneurs often become susceptible to lower loan amounts with higher interest rates than their White counterparts.

Government agencies like the Small Business Administration (SBA), community-based nonprofit organizations, business accelerators, and others are trying to address this racial wealth gap for entrepreneurs in many ways. For example, the SBA works with lending partners to guarantee 7(a), 504, and microloans (Small Business Administration n.d.). By guaranteeing, the SBA is mitigating the risk for lenders while providing competitive funding opportunities for minority entrepreneurs. Other opportunities for funding have become popular recently including crowdfunding, community-based grants, and business accelerator seed funding. Ultimately, all of these programs have increased the level of capital available for minorities.

Another challenge for minority entrepreneurs is the lack of access to social capital. Networks of investors, mentors, and partners are key resources for any new business. Having connections can put a business in a strategic position in the market and also provide that business with invaluable resources and advice in the early stages. However, this type of capital has often been unavailable to minorities. Today, private organizations, government agencies, and nonprofit entities are addressing this issue through the creation of national and community-based cohorts. Groups like the African American, Asian-American, and Hispanic Chambers of Commerce have offices around the country to engage with local minority business communities. These local agencies provide mentoring services and host networking events that foster deeper connections and opportunities for collaboration with other businesses.

Some minority entrepreneurs also have limited exposure to business education and training. On

average, nationally, Black students account for less than 10% of business school enrollment, and this lack of exposure to business fundamentals can put green entrepreneurs at a severe disadvantage. Understanding how to run and organize a business, manage capital, hire employees, acquire customers, access new markets, and navigate contracts and taxes are all skills that entrepreneurs need to have in order to be successful. The lack of a business acumen can keep a minority business small with limited growth.

Business incubators and accelerator programs around the country are helping minority businesses to fill their knowledge gaps. These entities are not only providing space, connections to industry practitioners, seed funding, and mentoring services but also educational workshops and trainings and access to free business planning resources that give entrepreneurs the skills they need to compete.

At the start of 2020, much of the world was engrossed in a worldwide epidemic due to the spread of the novel coronavirus. As local governments began to shut down schools, libraries, and other public places, businesses were forced to close too. Just 3 months into the pandemic, 41% of Black-owned businesses, 32% of Hispanic-owned businesses, and 26% of Asian-owned businesses had already closed, likely permanently, compared to less than 20% of White-owned businesses (Fairlie 2020). These minority businesses were especially vulnerable due to existing racial inequities in health and wealth access that had been further agitated by the COVID-19 pandemic.

The Coronavirus Aid, Relief, and Economic Security Act (Care's Act) was signed into law in early 2020. This stimulus package of federal relief for workers and small businesses included the Paycheck Protection Program. Administered by the Small Business Administration, this program was meant to provide loans to small businesses to help them maintain their payroll, hire back those laid off, and cover operating expenses. However, these PPP loans were unequally distributed among small firms, with only 20% of eligible firms in states with the highest densities of Black-owned firms having received loans. This unequal distribution also hit other minority- and women-owned businesses hard. In early 2021, government officials reevaluated and reopened the PPP loan program with an emphasis on minority businesses going forward.

## Mentorship and Programs

Minority-owned businesses need information and support in order to succeed, but it can be difficult to focus on each aspect and need. These types of businesses can get help and support from small business assistance organizations and programs. Mentoring and other support programs will enable participants to readjust, reimagine, or reinvent in preparation for any downturn due to a change in consumer interests, a demographic shift, or something more widespread, unpredictable, and disruptive like the COVID-19 pandemic. All entrepreneurs need to identify their competitors, understand the outlook for their industry, and learn how to find and follow this information in order to be a success now and into the future. Tackling topics like the business plan, incorporation, financing, budgets, marketing, human resources, contracts, licenses, regulations, taxes, and more are the mainstay of these organizations. They offer timely information, tips, and support to businesses with issues ranging from how to diversify a Workforce, how to take a business to the next level, and how to bid on contracts or prepare for an audit to how to recover from a natural disaster.

Some support organizations offer same-day service to clients over the telephone, via video calls and online chats or to walk-ins, while others schedule appointments. Many provide classes, both in person and online, where entrepreneurs can learn solid business skills. These newly acquired business skills can often make them more attractive to investors and put them in a better position to secure customers and contracts.

Small business assistance organizations can be found in plenty of communities, but a new small business, or even those that have been around for a while, may not be fully aware of all the services and resources at their disposal. These organizations serve as educators, resource providers, and

connectors. They can most often be found locally as nonprofits, at colleges and universities and even government agencies. Many help fledgling entrepreneurs acquire basic job and business skills, while others match entrepreneurs with mentors for one-on-one counseling and technical assistance.

There are many active small business support systems and networks throughout the country. A few, major, go to national organizations including the Small Business Administration (SBA), the United States Chamber of Commerce (USCC), and the Minority Business Development Agency (MBDA). The Small Business Administration produces both national and local editions of the *Small Business Resource*, a guide filled with articles and directories to help connect entrepreneurs with local small business assistance and resources (United States Small Business Administration 2020). Guidelines and tools for minority-, women-, veteran-, Native American-owned, and even rural businesses are plentiful via the SBA website or by contacting their local offices as well.

The Small Business Administration's *All Small Mentor-Protégé* program provides an opportunity for a small business to gain sound business knowledge through the guidance of an experienced government contractor. Mentors can help protégés develop management strategies, identify bid opportunities, master the bidding process, and assist with financial and administrative support. Protégés must have a mentor already identified when applying for this program. Requirements and rules, for both mentors and protégés, need to be met and adhered to in order to qualify for and participate in this program. Mentors and protégés can work together for up to 3 years with a possible extension (United States Small Business Administration n.d.-a).

Entrepreneurs can find further assistance from SBA Resources Partners such as the Service Corp of Retired Executives (SCORE), the Small Business Development Centers (SBDCs), the Women's Business Centers, and the Veterans Business Outreach Centers (VBOCs). Each of these partners have extensive programs and customized support for minority, women, and disadvantaged business enterprise (MWDBE) clients.

Founded in 1964, SCORE offers several unique programs for minority entrepreneurs including *SCORE for Black Entrepreneurs,* a website that features blogs, articles, webinars, and infographics that address the challenges Black businesses face (SCORE n.d.-b.) and their mentor program that matches entrepreneurs with volunteer executives who share real-world knowledge which is key to development and success. According to SCORE, "small business owners who receive three or more hours of mentoring report higher revenues and increased growth" (SCORE n.d.-a).

The United States Chamber of Commerce (USCC) is a long-standing organization that has been serving and representing all types and sizes of US businesses. Recognizing the economic importance that small and diverse businesses have on communities, the USCC has developed a number of programs to advance their growth including the *Hiring Our Heroes* program that supports veterans, transitioning service members, and military spouses, the *Native American Enterprise Initiative* that helps tribal business entities and Native American-owned businesses, the *Women Taking the Lead* program that supports and connects women leaders in government and business, and the *Next-Gen Business Partnership*, a nationwide collaboration with historically Black colleges and universities charged with supporting the next generation of diverse business leaders.

For more than 50 years, the Minority Business Development Agency (MBDA) has focused on the needs of minority-owned businesses. In 2020, it adapted its National Minority Development Week activities to a virtual platform and deployed over 10 million in federal funding under the Coronavirus Aid, Relief, and Economic Security Act (CARES). In September of 2020, the MBDA promoted the first *Buy MBE Day*, an initiative to encourage government contractors, corporations, and individuals to purchase from their local minority business communities (Minority Business Development Agency 2020.).

Economically disadvantaged, women, Black and other minority ethnic groups, LGBTQ, and veteran-owned businesses can also connect with organizations that specialize in

supporting their unique needs. Some of these are the U.S. Women's Chamber of Commerce (USWCC), the National Veteran-Owned Business Association (NaVOBA), and the National LGBT Chamber of Commerce (NGLCC). Because needs change throughout the life of a business, entrepreneurs often build long-term relationships with these organizations for sustained support.

Attending a networking event or conference sponsored by small business assistance organizations is another way for entrepreneurs to enhance and expand opportunities. Going to an event in person is a great experience, but virtual events offer valuable opportunities and have become the norm for health and safety reasons during the COVID-19 pandemic. Virtual events facilitate learning and networking without the expense and time of traveling and allow participants to remain local to attend to needs at work and home, major factors for a small business. A simple Internet search can reveal many national, regional, or local conferences, expos, and events happening throughout the year.

One regionally and specially focused example is the U.S. Haitian Chamber of Commerce, Inc., hosts the "Virtual Minority Small Business Conference and Expo." Originally started in Massachusetts, this organization has added chamber locations throughout the country to promote and assist Haitian businesses. Their conference and expo bring together partners, especially in the Boston area, who support the needs of the Haitian community. In response to the unprecedented hardships felt by all small businesses because of the COVID-19 pandemic, they expanded their 2021 Conference to include the needs of Black, Brown, and other minority small businesses (US Haitian Chamber of Commerce, Inc. n.d.).

There are also unique online courses that help entrepreneurs navigate the startup process. First course, focused in the Southwestern Pennsylvania region, is a collaboration project spearheaded by New Sun Rising, La Dorita, and Smallman Galley, three local small business incubators, and Shift Collaborative, a creative agency. The course, funded by the Heinz Endowments, is an online learning tool for food industry startups in Pittsburgh and the surrounding area. Participants learn skills to build their business and navigate the regulations, certifications, and licenses essential to restaurant and other food business operations. This venture was created with an eye toward having an inclusive and sustainable food industry in the region (First Course 2017).

Collaboration between organizations is another strength of these small business assistance programs. They join efforts to offer more complete services to their communities. By listening to the issues and concerns of their clients, they can find ways to help and assist. Referrals occur regularly.

Another vital function of small business organizations is their service as a voice for the small business community when policy changes need to occur. They petition local and national governments. Healthcare, benefits, tax reform, exports, finance, energy, the environment, and other important topics are at the forefront of advocacy groups like the National Small Business Association (National Small Business Association 2021). This was clear when the COVID-19 pandemic struck the heart of the nation's small businesses. The Coronavirus Aid, Relief, and Economic Security Act (CARES), Families First Coronavirus Response Act (FFCRA), and the Paycheck Protection Program (PPP) were some essential pieces of legislation enacted to help small businesses, and these same organizations offered guidance to entrepreneurs about how to apply for and put this aid into action.

Lastly, libraries should also be included in the small business assistance ecosystem. The library is often the first stop for an entrepreneur with a business idea. Libraries provide access to information that can help an entrepreneur further develop their business plan, learn about registering their business, do market research, and locate financials. Because libraries often have a lot of experience working with local small business organizations and funders, they can easily connect entrepreneurs with local small business organizations to get additional, one-on-one, specialized help.

## Government Certification and Contracts

Bidding for government and corporate contracts is another way that minority businesses can stabilize and grow. Federal, state, and local governments, as well as many corporations, have committed to policies that ensure a percentage of their suppliers and service providers are minority-owned small businesses.

According to federal law, 23% of government contract dollars are to be awarded to small businesses. Of this portion, 5% must be given to socially and economically disadvantaged businesses (United States Small Business Administration n.d.-b). Under the new administration, this has been further strengthened by the "Executive Order on Advancing Racial Equity and Support for Underserved Communities Through the Federal Government" issued on Jan. 20, 2021. In part, it states: "...Government contracting and procurement opportunities should be available on an equal basis to all eligible providers of goods and services. To meet these objectives and to enhance compliance with existing civil rights laws: ...each agency shall ...produce a plan for addressing...any barriers to full and equal participation in agency procurement and contracting opportunities identified pursuant to section 5(b) of this order" (Biden 2021).

Generally, government contracts are awarded to prime contractors, companies that work directly with the government. These contracts often stipulate that a portion of the work must be carried out by minority small businesses. Because prime contractors are responsible for managing all aspects of the job, they must comply with hiring eligible small businesses as subcontractors. There are also contracts, known as set-aside contracts, that can be filled specifically by 8 (a) minority small businesses.

Minority businesses can apply for special certifications in order to bid on set-aside contract work with government or corporate entities. An accredited certification process determines if a business is owned, controlled, and operated by a minority applicant and if they are a small business. This process also determines if the business meets any other socioeconomic conditions for additional certifications. Once granted, the certification allows businesses to compete for jobs that require small and diverse businesses on the job per the contract. Certifications are not one-size-fits-all. It is important to know which one a business qualifies for. Having multiple certificates to cover the different aspects of a business is a strategy that can increase opportunities.

A small business can pursue acquiring additional certifications based on the owner's socioeconomic condition such as woman-owned small business (WOSB), economically disadvantaged woman-owned small business (EDWOSB), minority business enterprise (MBE), veteran-owned small business (VOSB), service-disabled veteran-owned small business (SDVOSB), LGBT business enterprise (LGBTBE), etc. Many of the small business assistance organizations discussed previously aid with certification and may even be a certifying agency. Securing these certifications is vital to leveling the playing field so small businesses can gain access to jobs they may not otherwise be able to compete for. Minority and other diverse businesses increase their credibility and chances of landing bigger contracts by meeting the high standards of the certification process.

The Small Business Administration (SBA) and other certifying agencies provide up-to-date information on requirements. Certifying agencies, which include government bodies, nonprofits, or third-party certifiers, often use the SBA standards to determine requirements and eligibility. Basic criteria include that the owner (s) are US citizens, the business operates primarily in the USA, and it meets specific employee size and gross annual revenues. A tax ID number (EIN) along with a D-U-N-S number, NAICS code (North American Industry Classification System), and SAM number (System for Award Management – required if doing business with the federal government) are necessary to have. Additional documentation about ownership, finances, employees, and scope of business is reviewed, verified, and approved.

## The Future for Minority-Owned Business

The number of minority-owned small businesses is only expected to grow in the future. According to the Minority Business Development Agency, "By 2044, the Nation's prosperity will rely even more on minorities, the fastest growing segment of the population. Entrepreneurship is a sure pathway to wealth creation and a thriving national economy. Today, U.S. minority business enterprises (MBEs) represent 29% of all firms but only 11% have paid employees. If MBEs were to obtain entrepreneurial parity, the U.S. economy would realize 13 million more jobs (United States Census Bureau 2020a)."

On December 18, 2020, after months of negotiation and a chaotic election season, Congress passed a new coronavirus emergency package. In acknowledgment of the need for more robust support for small businesses, particularly minority businesses, the Act includes new funding for the Paycheck Protection Program (PPP) some of which is earmarked for Community Development Financial Institutions (CDFIs) and Minority Depository Institutions (MDIs) as well as nonprofits. The initial coronavirus funds were not sufficient to meet business owners' needs, but this next round offers fresh opportunities to access funds. As a new administration begins its work and vaccines become more widely available, new opportunities will open for minority-owned businesses.

## Conclusion

Even in extraordinary times, the personal qualities and skills that lead to entrepreneurial success remain constant. Another constant is that minorities, women, immigrants, and Black and Brown people continue to face greater barriers in achieving their business goals. Profiles and interviews celebrating successful minority entrepreneurs abound in popular media. Publications rightly highlight perseverance and ability to spot trends without losing sight of the long view as necessary traits for success. The life experiences of minority business owners enable them to identify and develop ideas and markets that others might not. The key for managing unequal access to resources is to learn about the challenges in detail and research and connect with both established and emerging support systems designed to mitigate these challenges.

# Minority Groups and Politics

Dragan Stanisevski

## Introduction

Public administration is commonly referred to as public service and public administrators as public servants (Denhardt and Denhardt 2015). Nevertheless, whom does public administration serve? This would seem like a plain question; still the answer is often not clear. Logically, there are three options: public administration could serve the majority, the minority, or everybody in the society. The answer, of course, would depend on the nature of the political system. In a democracy, the answer would need to be the people, the public in general, or it is not a democracy at all.

This image of democracy as a common rule nevertheless is a rather modern invention and a bit of a utopian invention for that. For the ancient Hellenes democracy was a far less idealistic option than it is portrayed today by democratic theorists. For Aristotle (2000) and Plato (2008), for example, democracy was a perverse constitutional system exactly because it led to a form of government that did not serve the public interest, the interests of everybody, but merely served the interests of one special group of people, the majority. What about the minorities, one could ask? Doesn't modern democracy instead necessitate a more comprehensive option, serving the common good, the same ideal Plato and Aristotle espoused?

Serving the public at large would seem like a preferred option, but what if the society has relatively stable divisions along ethnic, racial, religious, economic, or ideological lines and the interests of these groups diverge (Stanisevski and Miller 2009)? The issue of stability of divisions between the minorities and the majority brings up an even more intricate question: Who are the minorities? Aren't all of us sometimes a minority in some specific social circumstances or policy issues? Is it feasible to have an absolute consensus on every single policy issue? What then is the definition of a minority? The inconvenient answer is that it depends on the social and historical context. If a particular society has a long history of racial divisions, as is the case in the United States, then racial divisions might be socially more pertinent in delineating who are

the minorities. If on the other side a society has a history of ethnic or religious divisions, a situation common in a number of European societies, then these forms of social divisions might be more visible (Stanisevski 2008; Stanisevski and Miller 2009).

In essence, there is no single standard of delineation of a minority, but there are socially more or less stable divisions in nearly every society. Since different societies have different historical experiences, obviously the patterns of social polarization would also vary across different societies. While there are relatively homogeneous societies in the world, nonetheless a heterogeneity of social composition is increasingly a frequent characteristic in modern societies. This social heterogeneity is more often than not a product of historical accidents rather than careful constitutional designs and nation building. Does this make the assumption of tacit or explicit common agreement to a social contract a difficult proposition in any society that has a significant and entrenched minority population?

This is a perennial problem in democratic governance (Dahl 2005). It is a problem of having to choose between the proverbial Scylla and Charybdis: on the one side the Scylla of exclusion of minorities and on the other side the Charybdis of social polarization and dissolution of the social whole (Homer 1997; Sunstein 2003). This chapter outlines two common approaches to this dilemma: substantive representation and group representation, which are then synthesized into a concluding segment that deals with systemic exclusion and points out the importance of power dynamics in the identity politics in public administration.

## Substantive Representation

The preferred option, governing in the interest of the public at large and in defense of the common good, which is here called substantive representation, is so intractable that Aristotle (2000) and Plato (2008) believed it can only be achieved by actually empowering a minority; that is to say, it was impossible to achieve in a *democracy*, democracy ancient Hellenic style. Instead, Plato (2008) argued that the best and the brightest elites in the society should rule in the public interest, a constitutional order known in ancient Greece as *aristocracy* or which we would today more closely recognize as *meritocracy*.

Aristotle (2000) extended Plato's theme arguing that while aristocracy was normatively a better option, in practice substantive representation was more likely to be achieved by building a constitutionally mixed system, called *polity*, that combines the elements of a democratic rule of many, to which it leans, and an aristocratic/oligarchic rule of few, on which it depends. Aristotle's (2000) model benefits from a healthy skepticism of the benevolence of the aristocracy (rule of the best few representing the common interest). The aristocracy consists of elites, which when empowered frequently become self-interested and corrupt and thus turn aristocracy into an *oligarchy* (rule of few, generally the wealthy, representing special interests) (Aristotle 2000).

Modern constitutional systems of representative democracy are Aristotelian in nature, if not in displayed character. Public administration in particular is an aristocratic aspect of the liberal polity whose day-to-day rule is exercised within a policy framework adopted by the representatives of the people (Wilson 1887). Since the people cannot govern in the daily affairs of any society of meaningful size and complexity (Stanisevski 2011a), and the representatives of the people are bound to be partial to the interests of their constituencies, it regularly comes down to the aristocratic regiments of the supposed expert bureaucrats to represent the common good.

In this endeavor, public administrators are expected to be guided, not unlike Plato's (2008) philosopher kings, by the virtue of their expert education (Weber 1946) and socialized professional ethics (Friedrich 1940). The imperative of neutral professionalism is so extensive in the modern public service that even affirmative action programs in the United States are contemporarily defended as something that benefits the diversity interests of the overall community, not just the minority groups (Skretny 1996). As enlightened guardians of the common good, public administrators are expected to strive to include the

minorities and represent their interests not necessarily because of a desire for fairness and justice, albeit individually the civil servants might have those values as well, but because social inclusion is the most effective method of governing in the common interest.

This managerial consideration, effectiveness in governing, is perhaps more clearly evident in the *representative bureaucracy* approach to minority inclusion, historically the dominant approach in the study and practice of public administration. The core argument of the representative bureaucracy model is that having *passive representation*, higher inclusion of minorities, eventually leads to *active representation*, more attention to and better implementation of policies of specific interest to minorities, but which also benefits the larger community (Selden 1997). While evidence from studies varies (see Meier and Stewart Jr 1992; Selden 1997), the gist of the argument is that inclusion of minorities in public administration is not merely just, but it could also improve the performance and responsiveness of public agencies. As an illustration, if a law enforcement agency with jurisdiction in a say predominately Hispanic community lacks a sufficient number of Spanish-speaking officers, as well as officers that belong to and understand the local culture, this agency would have a hard time communicating with the residents and establishing good community relations. The lack of minority inclusion thus would impede the ability of the agency to perform its duties in this community. While representative bureaucracy model already bridges into the next section, group representation, the arguments are still well within the substantive approach to minority representation with a focus on effectiveness in protecting the common interest not merely particular interests of specific groups.

## Group Representation

The negative implications of the presumption of neutral expertise of public administration for the inclusion and welfare of minority communities were most strongly emphasized by the so-called New Public Administration movement (Frederickson 1980). Indeed, a key tenant of the New Public Administration approach was the requirement for public servants to be responsive to the needs of diverse communities rather than to be neutral implementers of public policy. Or to put it in simpler terms, if public administrators are implementing unjust and discriminatory policies, then the assumption of neutrality only leads to perpetuating injustice and not to protecting the common good. In an extreme example, the usual defense of the Nazi officers at the Nuremberg trials was that they were merely following orders and enforcing the policies they were charged with implementing (McSwite 2002).

The demand for defense of the interests and rights of minority communities in face of a hostile majority would be an essential duty even for Platonic guardians. New Public Administration school of thought, however, takes the argument further and advocates for active support of particular interests of minority communities as a basic necessity for maintaining or establishing social equity. Whereas representative bureaucracy proponents still largely articulate their arguments for minority inclusion from within the common framework of efficient public service, New Public Administration offers an extension of Waldo's (1948) assault on the efficiency narrative and demands group representation and minority inclusion as a matter of social equity and human right.

The aspiration for broader minority inclusion as a matter of social equity reflected the time in which the New Public Administration school of thought emerged, late 1960s Civil Rights Movement, when the efforts for desegregation and recognition of civil rights of minority groups in the United States regularly ran against the populist sentiment of the majority, but also often confronted the brutal oppression conducted by public servants in the segregated South. In such situations, group representation becomes more germane, arguably with an ultimate intention of blurring the dividing line between the particular interests and the common welfare.

The ambition for overcoming entrenched social divisions through a process of segmental group representation is also typical of *power sharing* or *consociational* models of democracy that

are less frequently discussed in American public administration, but are widely used in discussions of conflict resolution and minority integration in divided societies in the comparative politics and comparative public administration literature (Lijphart 1977; Stanisevski 2008; Stanisevski and Miller 2009). The consociational approach focuses more specifically on the institutional arrangements for minority inclusion in the decision-making process. It requires power sharing between the major cultural groups and establishing mechanisms for mandatory consultation, or even minority veto, thus making minority inclusion a procedural necessity. For example, our fictional law enforcement agency would require proportional representation not merely as a matter of enhancing organizational performance or as a demand of social equity but as a matter of institutional procedure and political necessity that mandates sharing of power. The focus here is on balance of powers; a balance which often emerges as a consequence of a political settlement, or an attempt for a settlement, of a deep social divide or protracted conflict (Stanisevski and Miller 2009).

## Conclusion

The focus on power sharing that consociational models of democracy bring directs our attention to a monumental issue that regularly lurks in the background when one discusses minority inclusion in public administration and yet it is commonly sidelined. The "elephant in the room," so to speak, is the issue of *systemic*, *institutional discrimination* that is so deeply imbedded in the very fabric of the political and social system that is quite often unrecognizable to many within the system and sometimes dismissed as a taboo (Young 2000).

One does not need to be a radical to recognize the pervasiveness of the patterns of exclusion and discrimination that comprehensively limit the opportunities for the minorities to advance in many societies. From inequitable educational opportunities, residential segregation, economic depravity, discriminatory law enforcement, and the related existence of an entire prison-industrial complex for mass incarceration that destroys lives and families, to consequent discrepancy in job opportunities that are essential for social mobility of minority communities, the systemic exclusion is not a momentary aberration of the American society, and most Western societies, but a historical pattern specifically institutionalized to preserve the power position of one group of people on expense of other groups of people (Alexander 2010).

In part, the systemic nature of minority exclusion in modern societies is an expression of the failure of modern liberal societies, as Plato (2008) would have predicted, to come to terms with the increasingly oligarchic character of modern liberal democracies. Modern liberal democracies, to the extent that increasingly oligarchic societies could at all be considered as democracies, often end up being seized by special interest groups (Lowi 1969). Although special interest groups typically represent the interests of oligarchic elites, which by definition are economic minorities, they tend to exclude the lower economic strata that are often populated by cultural, racial, or ethnic minorities.

While deeply reified economic inequalities and class divisions are crucially important (Cox 1948), systemic exclusion of minorities moreover cannot be reduced to economics. The depth and the pervasiveness of systematic exclusion of minorities across different social and historical contexts force us to give some attention also to the *psychology of group identity formation*. The psychology of group identity formation generally revolves around survival of the individual in a congregation with other familiar individuals and in an environment where the unknown is commonly considered as hostile (Stanisevski 2015a). The clinging to the group for perceived protection is not surprising given that the desire for survival of oneself and those one feels close to, such as one's offspring, is a primary human instinct (Stanisevski 2011b).

The awareness of the relative importance of ontological security in particular, and of the psychology of group identity formation in general, is both a drawback and a guidepost (Stanisevski 2011b, 2015b). It is a drawback in a sense that it

stresses the historic intransigence of patterns of minority exclusion. It further acknowledges the relevancy of context-dependent power dynamics, the bread and butter of politics (Lasswell 1936), which typically involves group conflict and dividing people between "us" and "them." The fact that Plato (2008) and Aristotle (2000) talked about some of these same issues of inclusion and exclusion about 2500 years ago and we still have not found an acceptable solution should give us at least some pause for reflection.

On the other side, developing an understanding of the psychology of group identity formation provides an opportunity for making more substantial inroads in direction of building more inclusive communities and public institutions by recognizing the degree to which familiarity plays a role in how we approach other people and how we deal with them in our political or social lives. Identity building always requires distinction, but the more we realize how contingent and fleeting our identities are, hopefully the better we could learn to cope with the fallouts of identity politics.

## Misclassification of Independent Contractors

David Bensman
School of Management and Labor Relations, Rutgers University, New Brunswick, NJ, USA

Misclassification of actually employed workers as independent contractors is one of the many ways that most American workers have suffered declining conditions of labor and of social protection in the past 40 years. Until recently, misclassification was an understudied phenomenon, but recent efforts by workers to gain recognition as employees, by unions seeking to organize them, and by government agencies trying to enforce labor laws and/or enhance tax revenues have brought the issue to the attention of many scholars as well as the general public.

Misclassification is controversial because the distinction between an employee and an independent contractor is unclear under Federal law and the laws of the 50 states. While the Fair Labor Standards Act of 1938 defined an employee, it did not define an independent contractor. Immediately many employers began reclassifying their employees as independent contractors, and legal disputes arose about whether or not their actions constituted misclassification. Since the facts of how people are put to work vary from company to company, the result has been a confusing and contradictory set of practices and outcomes.

In 2016, David Weil, head of the US Department of Labor's Wage and Hour Division, and a leading scholar of employment issues, and Laura Fortman, a deputy administrator, published a blog on misclassification which contended that employers were "sometimes misclassifying" their employees in order to cut labor costs. The result, they asserted, was that many workers were deprived of their labor rights, including protection under the health and safety laws and eligibility for workers' compensation and unemployment insurance protections.

There are currently 30 states that define independent contracting, each one somewhat differently, and the Internal Revenue Service has its own definition which is used for federal tax purposes. In July 2015, the US Department of Labor issued its own interpretation. While the definitions vary, usually they emphasize three elements. First, does the company have behavioral control of the worker? The more behavioral control it has, the more likely the worker will be found to be an employee. The second criterion has to be with how the worker earns revenue. Does she/he have an opportunity to make a profit or take a loss? How is she/he paid? Are expenses reimbursed? The third criterion concerns how deeply integrated the worker is in the company business. Is she/he doing work that is central to the company's business model? Does she/he work exclusively for this entity? Is there a written contract, and if so, what responsibilities does it entail?

While some independent contractors are truly independent, including high-paid professionals, working in Silicon Valley, Hollywood, and the - New York financial industry, and enjoying the flexibility of their various relationships with the companies that give them assignments, many more are low-paid workers who are misclassified as independent contractors. No one knows the full extent of the problem, because no comprehensive survey of contingent employment has been done since 2005, but this is not a small phenomenon. A study done for the US Department of Labor in 2000 reported that as many as 30% of employers misclassified, some of their employees as independent contractors. A study of the New York state workforce in 2005 found that 10.6% of the private sector workforce was misclassified as independent contractors.

Much worker misclassification is intentional, done by employers to reduce labor costs by approximately 30%. In part, this savings stems from not making required contributions to unemployment insurance and worker compensation funds, but it also comes from not paying state

and federal taxes. Companies also save by forcing a worker to pay taxes that they are supposed to pay, by failing to pay overtime, and by failing to pay the minimum wage. These forms of cost-avoidance give employers who misclassify an advantage over competitors who do meet their legal obligations.

Misclassification is common in many industries. The Department of Labor's 2016 blog mentioned restaurant dishwashers, cable installers, and home care workers in particular, but the practice has been found in the construction industry, trucking, package delivery, day labor, janitorial and building services, home healthcare, agriculture, poultry and meat processing, home-based work, the public sector, food processing, courier services, dentistry, waitressing, nail salons, nursing, clerical services, and landscaping.

Misclassified workers live a precarious existence, outside the legal protections associated with the employment relationship. Not only can they be terminated at the drop of a hat, but when they are out of work, they are not entitled to unemployment compensation. They are more prone to being injured on the job. Since the companies that put them to work do so only on a short-term basis, they don't invest in training them. This leaves them victim to high rates of workplace accidents. They are also at risk of being made sick by exposures to unsafe materials. When they cannot work, they are not entitled to workers' compensation. Their economic insecurity also makes them vulnerable to mortgage default and bankruptcy. When they attempt to find new work, they are not protected against discrimination. And all too often, they are victims of wage theft and insurance fraud.

Take the case of port truckers. According to a 2008 survey, the median wage of misclassified independent contractors at the ports of New York and New Jersey was $28,000 per year, without health insurance or pension benefits. That amounts to a shade less than $10 per hour. If the median independent contractor's household of three people tried to live on the drivers' income, the family would be living below what The Poverty Research Institute of Legal Services of New Jersey defines as the "true poverty threshold" for New Jersey, $32,484. Nearly three quarters of the independent contractors' families were without health insurance. One quarter of their families received no medical care at all because they could not afford it.

More than one-third of the drivers reported that they had been forced to drive with unsafe chassis, exposing their trucks, themselves, and members of the general public to on-road accidents. Drivers reported that they suffered from high levels of stress, high blood pressure, and asthma, as well as work-related chronic health conditions and injuries. The economics of their relationship to trucking companies means that independent contractors drove old trucks that released high levels of pollutants into the truck cabs and the surrounding environment. The most dangerous element of diesel engine emissions is a particle of 2.5 μm or less in diameter. It is coated with more than 40 dangerous substances. When passed into the bloodstream through the lungs, it causes asthma, lung cancer, and heart disease. Health studies indicate that the truckers' heart and lung diseases, caused by exposure to vehicle exhaust, result in elevated mortality rates.

Construction workers who labor as independent contractors are similarly vulnerable because of their economic insecurity. They are without access to social insurance of any kind, they can't join a union, and they rare get paid sick leave, holiday pay, or overtime. The nonunion, small companies that contract with them provide little training; as a consequence, they suffer high rates of fatal accidents. Bystanders at construction projects are vulnerable too; toppling cranes operated by untrained contractors have killed people and sparked municipal authorities to investigate the industry.

Misclassification also deprives governments of tax revenues and contributions to social insurance funds. The federal government was deprived of between $3 and $4 billion in income and employment tax revenue in 2013. Illinois alone lost between $300 million and $400 million dollars a year. For nearly 20 years, state and federal government departments have been trying to improve enforcement of employment laws. To some extent, these efforts have been in response to

pressure from labor unions which have mounted political and legal campaigns to enhance enforcement so as to raise work standards and enable misclassified independent contractors to join unions. In Massachusetts, Mark Erlich of United Brotherhood of Carpenters Local 40 played a key role in spurring legislative action. In California, it was the Teamsters Union, backed by Change to Win and a coalition of community, faith-based and environmental groups, that provoked then-Attorney General Brown to initiate investigations into misclassification and legal proceedings against cheating employers. The Teamsters' long-standing efforts to expose alleged misclassification at Fed Ex have been the most visible of the efforts to bring misclassification to the attention of government officials and the public. Throughout most of the country, state enforcement efforts have been responses not to substandard work conditions but rather to government loss of revenue. The state reforms fall into three categories. First, there are laws that create the presumption that a worker is an employee rather than an independent contractor unless the employer can overcome that presumption by demonstrating that the worker is truly independent. Twenty-seven states have passed such laws. Second, there are laws confined to the construction industry that codify uniform standards for employment classification in all state legislation regulating the construction industry. Third, there are laws creating a state commission or task force to coordinate enforcement by several agencies. The New York Joint Task Force is a prominent example of this type of reform effort. Its former chair, Patricia Smith, was later appointed by President Obama to head the federal Labor Department's Office of Solicitor of Labor.

In addition to these legislative efforts, the Office of the Attorney General in California has been prominent in bringing lawsuits against companies that misclassify their employees. Under former Attorney General Jerry Brown, now Governor, the Office won five cases against port trucking companies. After Brown was elected Governor, in 2010, the California Legislature passed, in 2011, new legislation on worker misclassification, which was hailed at passage as the strictest and most comprehensive piece of legislation in the nation.

Passage of this legislation brought about a flurry of lawsuits claiming back wages and other remedies for misclassification. In the port trucking industry, the back-pay awards and fines flowing from successful lawsuits have brought several prominent trucking companies into, or on the brink of, bankruptcy.

## Federal Reform of Misclassification Enforcement

Prior to 2009, the Federal Department of Labor did not target cases of misclassification per se. Instead, the Department, with limited resources, attempted to identify workers who were denied the wages due to them. Nowhere in the Department's records was the term "misclassification" used, and specific industries that misclassified employees as independent contractors were not categorized as such. In 2007, at a joint hearing on the misclassification of workers as independent contractors, before two House of Representatives subcommittees, managers of the Department of Labor were grilled about the meager results of their enforcement efforts. Multiple Representatives suggested, during questioning, that the Department do more to focus its efforts on misclassification and to coordinate its enforcement activities with the Internal Revenue Service and other agencies.

In 2009, enforcement efforts became a priority of the Vice President Joe Biden's DOL Misclassification Initiative, a program of his task force on the middle class. Under the new Secretary of Labor, Hilda Solis, the DOL signed a memorandum of understanding with the Internal Revenue Service, according to which the agencies would "work together and share information to reduce the incidence of misclassification of employees, to help reduce the tax gap, and to improve compliance with federal labor laws." The next step was for the Department's agencies to sign memoranda of understanding with state

Commissioners of Labor. To date, 32 states have signed such agreements.

At first, enforcement actions by the DOL lagged due to lack of resources. From 2011 to 2013, the Department of Labor's own account reported that it had only collected over $18 million in lost wages for almost 20,000 misclassified employees. However, the long-delayed confirmation by the US Senate of Thomas Perez to be Secretary of Labor in the summer of 2013 suggested to most observers that the Department's enforcement agenda would be beefed up. This belief was based on Perez' record as Maryland's Secretary of Labor, in which post he aggressively pursued employers who misclassified employees to avoid paying minimum wages and overtime.

The business community pushed hard against Perez, and its resistance caused Senate Republicans to hold up his confirmation for 2 years. After he was confirmed in July, 2013, Perez announced that misclassification constitutes workplace fraud, and he vowed to make combating the practice a priority of his Department.

Similarly, when President Obama, on Sept. 15, 2013, nominated David Weil, a pioneer in strategic labor law enforcement, to be administrator of the Department of Labor's Wage and Hour Division, a post that had been vacant since Obama acceded to the Presidency, Republicans in the Senate once again mounted opposition. Leading business advocates claimed that Weil was biased against employers. A column in *The Wall Street Journal* characterized him as a "union lackey {who} dislikes certain industries, including retailers, homebuilders, janitorial services and fast-food outlets." Echoing these charges, Republican Senators blocked Weil's confirmation until April 28, 2014, when he was confirmed on a 51–42. A professor at Boston University and codirector of The Transparency Policy Project at Harvard University's John F. Kennedy School of Government, Weil had advised the Wage and Labor Division for years and was a prime mover of Massachusetts' campaign to enforce labor laws in the construction industry. He defended himself at his Senate confirmation hearings by asserting his commitment to creating a level playing field for honest employers. In 2015, he issued an "Administrator's Interpretation" which set out the Department's policy on enforcing the Fair Labor Standards Act's definition of employment status. That year, the Wage and Hour Division of the DOL reported that its collaboration with state labor departments had resulted in payment of $74 million in back wages to more than 100,000 employees.

After Weil's confirmation, efforts of the business community and Senate Republicans to block enforcement continued. Although Secretary Perez allocated $10.2 million to aid 19 states in combating misclassification in 2014, Senate Republicans cut the program in 2016. The Secretary's 2017 budget attempts to restore the funds.

## Conclusion

Misclassifying employees as independent contractors is one method that employers use to disguise the existence of an employment relationship. Misclassification occurs frequently both because the laws defining the employment relationship are opaque and because the motivation to misclassify is strong. Employment legislation does not clearly define an employer or an employee. There are multiple jurisdictions regulating employment relationships, and these jurisdictions use various and sometimes contradictory definitions. Case law is inconsistent.

While the opacity of the definition of independent contracting causes some employers to misclassify workers as independent contractors, much misclassification is intentional, because employers have much to gain by denying their responsibilities. It is generally estimated that companies reduce their wage costs by 30% by avoiding unemployment and worker compensation contributions, social security taxes and overtime payments. Furthermore, employers who misclassify are free to discriminate against workers without legal interference and may find it easier to withhold wages. They may also find it easier to evade responsibility for insurance claims and legal infractions.

The practice of disguising employment relationships has become very common in the United States. Studies have shown that as many as one-third of employers misclassify employees as independent contractors and that many other employers use multiple levels of subcontracting to obscure their responsibility. While many independent contractors are high paid and truly independent, the large majority of independent contractors work in low-wage industries and suffer from precarity. They earn low wages without benefits. They are not protected by employment laws. They do not have pensions or health insurance. They are subject to unpredictable or frequent layoffs and lack unemployment insurance coverage. They receive little or no training, so they have limited chances for advancement. They often work long hours without overtime pay. They are subject to wage theft. As is true of many contingent workers, misclassified independent contractors often work in dangerous conditions, and are exposed to unhealthy substances. They suffer inordinate numbers of accidents and suffer from high levels of stress. Their health outcomes are generally poor.

The extent of misclassification is currently unknown because regulators have lacked the will and resources to quantify the practice. State level studies have estimated that one-third of employers misclassify their employees and that 10% of employees are misclassified. In some industries, such as construction, port trucking, and parcel delivery, the practice is much more frequent. Patterns of misclassification have been identified by state regulators in a wide variety of industries. In January 2016, the Bureau of Labor Statistics, an agency under the DOL, announced that it would work with the Census Bureau to bring back the contingent worker supplement to the Current Population Survey, starting May 2017. This step may clarify how many people are working as independent contractors or temporary workers and how many are holding down more than one job at any moment in time.

Misclassification not only adversely impacts workers, but it also drains governments of revenue. State and federal treasuries lose income and payroll tax revenues. In addition, state unemployment insurance and workers' compensation funds are deprived of contributions. In total, the lost receipts total billions of dollars annually. As state and local governments began to suffer from fiscal stringency at the end of the twentieth century, some turned to enforcing employment laws as a means of enhancing revenue. They passed legislation defining independent contracting and misclassification and began mounting enforcement efforts. In the wake of the new legislation, lawsuits against employers for wage theft became more frequent. In the port trucking industry, the overwhelming majority have succeeded. After a congressional oversight hearing in 2007 which exposed the passivity and underfunded nature of US Department of Labor action, the federal government tightened its enforcement. President Obama's appointee as Secretary of Labor promised vigorous enforcement and negotiated partnerships with federal and state agencies to combat misclassification. Thirty-two states have signed memorandums of understanding with the federal Labor Department. Vice President Biden launched a Misclassification Initiative which succeeded in increasing funding for the Wage and Hour Division of the Department of Labor, although Senate Republicans rescinded funding for fiscal year 2016. Business advocates vilified David Weil, President Obama's nominee to administer the Wage and Hour Division, which had been without a leader for more than 4 years, before confirming him after a 7 months delay.

Misclassification of employees and employer disguising of the employment relationship is a worldwide phenomenon. The International Labor Organization has taken up the issue and recommended new regulations and enforcement enforcements. So far, its efforts have been thwarted by business opposition. As a result, the standard employment relationship, as it emerged in Fordist economies in the twentieth centuries, is being undermined. The legislation passed throughout the world to regulate that relationship is becoming outdated and inadequate. Workers find themselves in an ill-defined borderland, a grey zone, where confusion reigns; standards are shifting, lowering, or disappearing; and abuse is

rampant. While the flexibilization of work is creating new opportunities for innovation and entrepreneurship, for most workers, the result is a retreat to the conditions prevailing before regulation began, a jungle of insecurity and exploitation. The effort to redefine the employment relationship, to prevent abuses new and old, and to encompass technological changes in the work environment, is in its infancy.

## Synonyms

Crime in NPOs; Dark side of nonprofit organizations; Deviance and misconduct in NPOs; Deviant Voluntary Associations (DVAs); Fundamentally deviant NPOs; Non-conventional NPOs; Partly deviant NPOs; Rule-breaking in or by nonprofit organizations (NPOs); Tolerable deviance in NPOs; Unconventional NPOs

## Definition

Deviance: refers to rule-breaking in some sociocultural system, such as a society or nation-state, where prevailing system customs and norms are viewed as the rules. There is a spectrum of seriousness of deviance in any such system at any given historical time period.

Misconduct: is mild, tolerable deviance, while *crime* is serious deviance that violates one or more laws of the sociocultural system or nation.

Deviance: in nonprofit *groups* is behavior enacted in or by a nonprofit group that violates one or more of the laws or moral norms of the society in which the group is embedded.

A deviant nonprofit group: is a nonprofit group that deviates significantly from certain laws or moral norms of the society.

A Deviant Voluntary Association (DVA): is an association with one or more major goals or usual means of achieving major goals that deviate from the moral norms or laws of the surrounding society at the time.

## Introduction

An objective, scientific field or discipline centered on nonprofit sector (NPS) research can only be built wisely with full understanding of the objective realities of all its phenomena. All kinds and aspects of nonprofit sector groups, both informal and formal NPOs, as well as all individuals involved in the NPS, such as paid-staff and volunteers of NPOs of different kinds merit careful study, including empirical research and theory about both the potentially or actually beneficial *and* the potentially or actually harmful aspects of NPOs.

The potential or actual negative or harmful aspects associated with the nonprofit sector have been termed *the Dark Side of voluntarism*, referring to nonaccountability and deviance by NPOs. This Dark Side refers to all kinds of perceived rule-breaking, deviance, and misconduct by NPS individual participants, formal and informal volunteers – both regular and episodic, paid staff, officers, and committee or board members, as well as by informal NPS groups, mainly voluntary associations, and by formal NPOs at every territorial level, from International NGOs or INGOs, down to block and building associations, throughout human history and all over the world. The main focus in this chapter is on nonprofit groups and organizations, rather than on individuals in the nonprofit sector or on the profit sector as a whole.

Acknowledging Dark *Side* phenomena is not meant to endorse or condone its occurrence, but rather it is suggestive of efforts by the social scientists to engage in the scientific examination of them. *Potential* harmful or negative effects do not necessarily translate into *actual* harmful or negative effects, but it is wise to know about such possibilities. Identification of deviance or dysfunction and their causation enables the prevention or amelioration of potential risks of Dark Side phenomena. Moreover, there are virtually no human activities, including human activities as group members or participants, which do not have their potential negative aspects, however positive their main effects may be in the long-term. Some Dark Side phenomena that seem to have direct harmful or negative effects on the participants, or on the larger society, may have very beneficial or positive longer-term effects, either for the individuals or the group involved or for the larger community, society, and world, or both. Successful social movement organizations are but one example here. For instance, the anti-slavery movement in the 1800s in England and the USA was strongly resisted initially by the general public, by most businesses, and by the government.

Highlighting the Dark Side of NPOs, or of NPS phenomena more generally, is ultimately a metaphor and overgeneralization for the purpose of communication and emphasis. There is clearly a spectrum of shades of beneficial brightness to harmful darkness of NPS phenomena, applying evaluative criteria in terms of impacts resulting from actions by NPOs or any individuals in the NPS. This spectrum ranges from the positive, bright pole of almost totally good, beneficial, and benevolent, such as the charitable nonprofit service work of Mother Theresa and her Roman Catholic religious order as an NPO. In the middle of the spectrum is a neutral or gray phase of the harmless, inoffensive, and innocuous NPO activity, such as a grassroots association of model train enthusiasts. At the dark, negative pole of almost totally evil, harmful, and detrimental, truly dark side of NPOs are Deviant Voluntary Associations or DVAs, such as the German Nazi Party and its affiliates under Adolf Hitler from 1921–1933, when it was still an NPO, not a part of the German Third Reich 1933+.

## Arguments for NPO Dark Side Research

The following section outlines several important reasons why there is a need for more empirical work and theory with respect to the Dark Side of NPOs:

1. An informed understanding of the Dark Side can provide a more objective and balanced approach to NPS scholarship, helping to overcome widespread *boosterism* among many scholars and especially practitioners. Boosterism, or the tendency to focus solely on the positive aspects of the NPS, runs the risk of overlooking or deemphasizing critical flaws or dysfunctions. Too many researchers, observers, and leaders in this field talk and act as if the sector were indeed angelic or sanctified (e.g., Wagner 2000: Chap. 5), with *only* beneficial activities and outcomes.
2. Studying the Dark Side can connect the field of nonprofit research more clearly and effectively to the general study of crime, deviance, law, and regulation – criminology, penology, deviance studies, criminal justice studies, police science. This linkage very much needs to be developed and strengthened in order to promote scientific and scholarly objectivity.
3. Dark Side study can better provide useful, practical advice to policy-makers and leaders, paid staff, and volunteers in all sectors of society regarding the prevention, monitoring, and appropriate sanctioning of deviance and misconduct in and by NPOs. For instance, knowledge of the determinants of or influences on fraud or theft in NPOs can help prevent or reduce the occurrence of such NPO Dark side events (Zack 2003). Liability issues and other aspects of NPO risk management and accountability are very real practical concerns for all larger NPOs these days, and controlling NPO deviance is one central concern of risk management.
4. Dark Side study can potentially increase the future viability and survival of specific NPOs valuable to society in the longer term. Fairly recent events in the USA show that even a very large and well-known nonprofit can have a Dark Side scandal that leads to its demise within a single year, as occurred in 2009–2010 for the national US NPO named Association of Community Organizations for Reform Now (ACORN). This rapid demise for a national or other territorial level NPO could potentially happen to *any* voluntary organization anywhere. Even when such a Dark Side scandal does not cause the demise of an NPO, such crime or misconduct can deeply harm future resource attraction, as occurred temporarily for the United Way of America in the 1990s, when its top leader William Aramony was imprisoned for his crimes in that NPO.
5. Dark Side study and resulting practical improvements in NPO management and conduct could help to increase societal support for, and giving to, NPOs generally and to the NPS as a whole. The beneficial result nationally might be greater donated time, money, and objects, including human blood and organs, and greater government and business sector support of the NPS. This could result partly from reducing the number of high profile NPO misconduct or deviance scandals, which tend to have a negative effect on general public attitudes as well as on government and business sector attitudes toward the NPS and its groups or activities (e.g., Smith et al. 2016b: Chap. 49).
6. Investigating the Dark Side of the NPS can contribute to an improved understanding of effectiveness, impact, and efficacy of the NPS and its participant NPOs and also its individual participants by pointing out the preventable causes of deviance and misconduct and the problems of regulation and *mis*regulation of the NPS and NPOs (Corbett 2011; Smith 2017a; Smith et al. 2016a: Chaps. 41, 54).

## Relativity of NPO Deviance and Misconduct

NPS Dark Side activities, as in other sectors of society, vary greatly in their shades of beneficial brightness to harmful darkness according to the

ideologies and attitudes of observers or critics. Perceived deviance, as rule-breaking, can be quite relative. In complex, contemporary societies, as contrasted with much earlier, simpler, high consensus, preliterate societies, one person's or one group's *deviance* may be another person's or group's principled *virtue* or benevolence toward society or all mankind. Hitler and his Nazi Party *true believers* were convinced that they were helping all mankind by killing all Jews, Slavs, gypsies, and homosexuals so as to "purify the Aryan race." One person's *terrorist* or *revolutionary* can be another person's *freedom fighter* or *hero*. For political liberation struggles, which label ends up being applied by history to the challenging group or movement often depends upon who wins the struggle, rebellion, or war, whether a conventional war or guerrilla war.

Revolutionary sociopolitical movements and groups have overthrown absolute monarchs, colonial governors, and all manner of other autocrats while seeking self-government and, sometimes, representative democracy in the past 200 years of human history around the globe. These movements and their component groups, usually *Deviant Voluntary Associations*, or *DVAs*, have nearly always been labeled by dominant elites, and many times also by the general public, as dangerous, even depraved, deranged, fanatics, madmen or madpeople, terrorists, traitors, rebels, seditionists, revolutionaries, etc. Such was the case in terms of labeling by the British monarchy, British leaders in the American colonies, and even British sympathizer colonists when many American colonists rose up against their British rulers and started the successful American Revolution in the late 1700s, with DVAs playing a crucial role as Committees of Correspondence and local voluntary militias.

These examples show clearly that the identification and labeling of rule-breakers as *deviants* and rule-breaking events as *deviance* are complex and multi-faceted, often disputed by conflicting stakeholders in a situation. So, too, the specific nouns and adjectives used to stigmatize political opponents are also problematic, especially in struggles for the liberation and freedom of nations or ethnoreligious categories of people in a given society or nation-state. There are at least four key facets of the relativity of the label and concept of *deviant*, and also *deviance*, and all of the more specific, often pejorative, labels used to characterize people with different values and norms, let alone races and ethnoreligious traditions.

## The Relativity of Group Perspectives on Deviance

One facet of this broader relativity is that deviance can be, and often is, defined in opposite or very different ways by any given in-group vs. out-group, that is, depending on the specific group perspective being used as a vantage point. William Shakespeare wrote the truth when he had one of his characters say, "There is nothing either good or bad but thinking makes it so." Members of, or participants in, a deviant NPO or DVA often see themselves as "good people doing the right things." However, their larger society, especially government authorities, may often see them as "bad people doing the wrong things." The larger global society may generally side with one or the other of these two alternative perspectives, or may have a still different perspective, perhaps more mixed and doubtlessly variable among nations, among ethnoreligious categories of people, and through time and history.

As an example, among members of deviant new religions, sometimes pejoratively termed *cults*, consider the Hare Krishna, technically, the International Society for Krishna Consciousness/ISKCON. Beginning in America and spreading elsewhere, *nonmembers* in the 1970s and 1980s were usually seen by ISKCON participants as extremely evil, even as *devils*. By contrast, for many years after ISKCON's founding in 1965, most Americans' attitudes towards the Hare Krishnas were that they were weird but harmless, as members of an initially Eccentric DVA in present terminology. When the Hare Krishnas started bothering people systematically at airports, giving flowers or their religious books then demanding donations, attitudes often shifted toward their being seen as a genuine nuisance but still harmless.

Later, more extreme and illegal deviance by some Hare Krishnas led to sensational exposés in

the mass media and books. These deviant acts by some Hare Krishnas and sensationalizing of such events in the mass media helped shift public attitudes toward the extreme negative end of the spectrum. Such shocking events occurring in the 1980s on the heels of the Jonestown mass suicide in 1978 in Guyana, and a growing anti-cult movement in America and elsewhere, led to increasing stigmatization and more negative labeling of ALL new religions and their participants, not only ISKCON.

## The Relativity of Degree of Societal Consensus on Norms and Customs

A second facet of this relativity of deviance is that broad, let alone virtually total, societal consensus on values, customs, and norms is rare and usually nonexistent in most contemporary nations. In preliterate societies, reaching back from about the 1800s globally to more than two hundred thousand years ago, high consensus on customs-norms was usually present, based on more recent, anthropological studies of pre-contact tribes. As ancient civilizations, monarchies, and empires began to arise roughly 5000 years ago in Egypt and later elsewhere, smaller high-consensus societies were assimilated into larger agglomerations, where overall consensus was weaker. We lack accurate information on most of the population's values and normative attitudes for most or all preindustrial societies, because representative sample surveys of the population were rarely or never done until the mid-twentieth century.

The European Values Survey (EVS) and more recent World Values Survey (WVS) in the past three decades have begun to remedy this huge gap in our knowledge of contemporary societies. Historians have, through the ages, customarily written only or mainly about the national elites and government matters, including wars, with little if any focus on the lives or attitudes of the general population until quite recently, as the social and institutional history of the past 50+ years. But such larger, conglomerate, preindustrial societies also probably lacked broad consensus on anything more than a small number of values and norms. The WVS data show clearly the current lack of consensus on values in both preindustrial and industrial or even postindustrial societies.

In modern nation-states, owing to technological advances, we now have the powerful, nationwide, more consistently socializing influences of mass formal education and widespread exposure to the mass media, including now the Internet and its wide variety of content, plus other personal-social electronic media. As a result, the breadth of consensus on certain key values and norms in such nations is probably much greater in extent than in the intervening period between the roughly 200-millennia-long dominance of preliterate societies on our planet, roughly until two or three millennia ago, down to industrial and post-industrial society dominance, roughly from the mid-1800s on to the present. Even in the most educated contemporary societies with high mass media and Internet-personal-social electronic media exposure, recent national surveys show wide internal variations in many values, customs, and norms, let alone across nations.

## The Relativity of Changing Deviance Attitudes-Perceptions Over Historical Time

What is perceived by many or even most people in a given society as deviant at any given time in its history may not have been perceived as deviant earlier in that society's history or be seen as deviant later in its history. In most prior agrarian societies for many centuries before the 1900s, women were generally treated as objects, not as persons, and had few if any rights. In fact, public attitudes toward a person, organization, or nation can change overnight. For example, consider the galvanizing effect on attitudes toward Japan and the Japanese of the US population right after the Japanese sneak attack on Pearl harbor in 1941 or the similar effect of the 9/11/2001 Al Qaeda terrorist plane crashes into the New York World Trade Center on attitudes toward terrorists and especially Muslim terrorists. The general long-term trend for the past century in global society has been for fewer and fewer types of behavior and beliefs to be seen as fundamentally or intolerably deviant. People worldwide,

especially educated people, are gradually, if only very slowly, becoming more tolerant of differences in values, customs, beliefs, and behavior by people in other nations and other racial or ethnoreligious groups. The Internet, increasing formal education, and ever more widespread globalization through the mass media support this trend.

Such broad attitude-perception changes are especially likely where some sociopolitical movement in a given society or elsewhere in the world has worked hard to gain more public tolerance of, and empathetic understanding for, a particular type of behavior, custom, belief, value, trait, or other characteristic that was previously stigmatized. Examples are the gay and lesbian rights movement in Western societies in the past 75 years and similarly the movement for rights of the physically or mentally disabled. One major part of this global trend toward more tolerance is termed *multiculturalism* – the tolerance and acceptance of the validity or moral rightness, or at least tolerability and minimal acceptability, of various ethnic, racial, and cultural differences within and among different nations.

## The Relativity of Long-Term Contributions to Positive Social Change and Ethical Evolution

Many DVAs and their larger social movements, if present, seem initially very harmful and dangerous, especially to governments, many businesses, and to the categories of people the DVAs are attempting to change, which are often the general public – nearly everyone. But many of these DVAs and their larger sociopolitical movements turn out in the long run to have great benefits for the general population of their nations or even of the whole world. Prominent examples of such ethical evolution are the abolition of slavery, equal rights for women, environmental conservation and ecological balance, civil rights for people of color, tolerance and rights for homosexuals, fair labor practices by employers, and equal rights for the disabled (Smith 2017b).

Among other aspects, the Dark Side of the NPS and NPOs thus also includes significant social system-challenge attempts by DVAs that are based on very positive, humane, social values. These high-principled, system-challenging *Dissenting DVAs* have sought, often successfully, sociocultural change and ethical evolution of human society in pursuit of human rights, civil liberties, social justice, security, peace, tolerance, poverty alleviation, ecological balance, and optimal human individual and societal development. Some sociopolitical movement and one or more of its component DVAs has initiated nearly every important, positive form of sociocultural change and ethical evolution in societies all over the world and throughout human history, ranging from the abolition of slavery to the creation of public zoos, A to Z, but especially since about 1800, with the Industrial Revolution and its accompanying *organizational revolution*. (Smith 2017b).

Gamson's (1990: 53) path-breaking study of a random sample of American social movement organizations from 1800 to 1945 showed that *about half (49%) of such challenging groups studied achieved some significant new advantages*. This is an astounding track record of success in changing American society for the better. The new advantages resulted for the *targets of benefit*, which might have been the challenging group members or some nonmember category or group of people, sometimes most or all of American society. Gamson carefully did random sampling (p. 287) of social movement groups in America for this 145-year period. Thus, these results can properly be generalized to the more than five hundred national, sociopolitical movement-linked, challenging groups as DVAs that existed in this period in America but that were mostly not studied in Gamson's actual sample.

Similar results are likely for other, currently industrial or postindustrial nations of the world that have, or have had for significant historical time periods, democratic governance structures. Tilly's (2004: 140–143) analysis of social movement organizations from 1768 to 2004 in Western Europe and North America suggested that social movements *sometimes* cause more general democratization in nations but can also have the reverse effect or no effect on democratization, whatever other main effects they have had.

Dalton's (1994: 187) study of 64 Western European national or transnational environmental social movement organizations, often as DVAs, indicated that the social movement leaders saw protest by itself as relatively ineffective. Protest and related direct political activities were used often or sometimes by 48% of the environmental groups studied (p. 183). But leaders viewed such actions as most effective when backed up and followed though by more conventional group political activities (pp. 195–198). In general, the environmental social movement and its major social movement organizations have had a substantial positive impact in Western Europe in the past few decades. This has been clearer for the conservation social movement groups than for the ecological balance social movement groups (pp. 256–259).

## Deviance and Misconduct in Conventional or Mainstream NPOS

Approaching milder aspects of NPO deviance by way of studying nonprofit agency *accountability* has been growing in favor recently in the broader research and practice literature. The practical issue of accountability, potential or actual deviance in present terms, in charitable and other NPOS is a very old one, tracing back at least 800 years (Fishman 2007). But increasing numbers of people in the fields of nonprofit management or administration and foundation governance are getting interested in the subject. They approach this topic of accountability mostly from the standpoint of practical steps that need to be taken to avoid deviance, often referred to more euphemistically as *nonaccountability* or *norm--breaking*. They very rarely focus on doing empirical research about the nature and causes of deviance in and by NPOs. The work of Corbett (2011), Jordan and van Tuijl (2007), and Zack (2003) are examples of this growing interest in the accountability of NPOs.

The Dark Side of the NPS clearly exists objectively in all contemporary nations, as evidenced by recurring, credible reports in most of the news media, especially newspapers, regarding NPO deviance *scandals*, mostly dealing with conventional nonprofit agencies or foundations (e.g., Fremont-Smith and Kosaras 2003; Gibelman and Gelman 2001; Greenlee et al. 2007). A few well-known examples involving conventional NPO deviance in or affecting the United States would include the on-going current scandal of child molestation by Roman Catholic priests in America, and the William Aramony financial abuse scandal at the United Way of America in the early 1990s. Several overviews of deviance in NPOs, both agencies and associations, now exist (e.g., Smith et al. 2016a, b: Chap. 54; Zack 2003). Several books broadly critique NPOs for misconduct and deviance, especially in the USA (e.g., Fishman 2007; Smith 2017a; Wagner 2000).

## Deviance and Misconduct in Deviant Voluntary Associations (DVAS)

Most NPOs are conventional or mainstream in their goals and means of achieving them, abiding by prevailing laws and moral norms of their society at the time. However, a very small percentage, perhaps 1% or less, of NPOs are persistently deviant and unconventional from their origins. Because members and often all or most leaders are volunteers, with no paying jobs to lose, voluntary associations are statistically more likely to involve deviance than are paid-staff-based nonprofit agencies. Much of the serious deviance in nonprofit agencies involves stealing or misusing money in some way (Greenlee et al. 2007; Zack 2003), and there is little money in most voluntary associations, especially GAs as local ones.

This tiny percentage of associations termed fundamentally Deviant Voluntary Associations (DVAs) are nearly always deviant from their origins or founding, as suggested above. Transforming from a conventional, non-deviant association to a DVA is historically very rare, according to qualitative research. Accepted moral norms are taken to mean customary definitions of right and wrong activities, including speech or other communication, held by a substantial plurality of normally socialized adults in the society. A more stringent definition of

accepted moral norms could insist on a 51% majority of normally socialized adults. Laws may be customary common laws or enacted laws, from a legislature or other government authority, including an autocrat.

There are three main types of DVAs, varying in their extent and duration of deviance, according to Smith (2017a): Eccentric, Noxious, and Dissenting, described as follows:

### Eccentric DVAs

Among the very tiny percentage of DVAs in any society, the vast majority seem to fall into the category of *Eccentric DVAs*. Even though they are actually innocuous, Eccentric DVAs are usually stigmatized and derided initially by many people in their societies of origin, and are often repressed by government authorities. However, these Eccentric DVAs are, by definition, innocuous in actually causing little objective harm. Any actual harm present tends to affect the DVA members mainly or solely, and the members usually endure this harm voluntarily. Further, this supposed harm is mainly in the eyes of nonmembers or disgruntled former members, not seen by the active members themselves as self-perceived *victims*. Some examples would be innocuous new religions such as modern witches' covens, odd left or right wing political parties, and sexual deviance groups like group marriage or swingers' groups. Eccentric DVAs represent the broad middle ground or gray area of the Dark Side of the NPO spectrum.

### Noxious DVAs

By contrast, *Noxious DVAs* represent *the Darkest of the Dark Side* of the NPO spectrum, having no redeeming positive values. But they are very rare among all associations, and even among DVAs. Such Noxious DVAs are objectively and significantly, often substantially, harmful and violent, even lethal, in an enduring way to their members, to the targets of their activity, to the larger community or society, or to some combination of these. Their deeply and pervasively harmful effects often go far beyond their effects on their members. Some examples here would be certain terrorist organizations and violent hate groups: The German Nazi Party from 1921 to 1933, when it was still essentially a DVA not an arm of government, but also thereafter, taking full power from 1933–1945; the Ku Klux Klan/KKK in America in the 1860s–1890s, the 1920s, and later in the 1950s–1960s; and Al-Qaeda in the past three decades.

### Dissenting DVAs, as the Dark Energy of the NPS

The relatively beneficial and positive part of the Dark Side of NPOs are *Dissenting DVAs*, which in some way are trying to change or improve the *status quo* from their own perspective and *also* from the longer-term perspective of later history. Such DVAs are routinely stigmatized and criticized by nonmembers and especially by the government of their society when they first mount their challenges. Some examples are world religions, such as Christianity and Islam when new, 1800s social movement organizations/SMOs advocating antislavery and woman's voting rights, and the underground resistance organizations during World War II in Nazi-occupied European nations.

However, many Dissenting DVAs are also recognized decades or longer later as contributors to positive social change and ethical evolution in their societies (Smith 2017a, b). Of course, not all Dissenting DVAs turn out to have significant long-term positive societal consequences, but the ones that do have often changed human society for the better permanently (Smith 2017b).

Dissenting DVAs can be seen particularly as *the Dark Energy of the NPS*. This view builds on the conception of volunteerism as a form of potentially renewable, natural energy. Dissenting DVAs are *Dark* Energy because the volunteerism they generate or mobilize initially deviates in major goals or means from existing laws or moral norms of their society. Dissenting DVAs, and perhaps other DVAs (especially a few Eccentric DVAs), also deserve to be seen as a special kind of *energy* because they often cause or energize major societal reactions, including eventually mass mobilization for their goals and often pervasive and significant societal change, if successful (e.g., Gamson 1990: 53).

More broadly, there is a potential and often actual Dark Side to *all* individual and group behavior in any institutional activity area or sector of society. For instance, there are deviant groups in such institutional areas as the family, education, religion, leisure, communication media, politics, and the economy – both conventional and underground. It is human to be selfish and even harmful to others at times, sometimes persistently. It is also usually human, but perhaps to a lesser extent, to have some altruism toward others, especially in one's household or immediate-nuclear family. But there is also much evidence that at least friendly reciprocity is present in helping and giving to others outside one's household and immediate-nuclear family. Sometimes non-reciprocal altruism is also present as individual philanthropic behavior in humans, but this is highly variable among people.

## Conclusion

The Dark Side of NPOs, and of the NPS more generally, has received significant research attention, some of which is cited above and more is listed as references in documents cited. But the researchers involved have rarely been closely identified with the mainstream of voluntaristics research, as in members of ARNOVA (www.arnova.org) or ISTR (www.istr.org), or authors with articles published in their academic journals, *Nonprofit and Voluntary Sector Quarterly* and *Voluntas*.

Reducing neglect of the Dark Side of NPOs in our interdisciplinary field of voluntaristics and NPS research will contribute to building a healthier and more effective NPS and NPOs in the future. It will also contribute to a more comprehensive, less positively biased, interdisciplinary field. If biologists and physiologists studied only healthy organisms, they would never know how to identify, ameliorate, or cure, let alone prevent, diseases and disorders in living organisms. We need to have the scientific curiosity and practical values of applied altruism to do the same in our field. We must examine objectively the full range of Dark Side flaws and problems of deviance in NPOs.

The NPS image as the *Sanctified Sector* (Wagner 2000: Chap. 5) or the *Angelic Sector* (Smith 2017b) that can do little or no wrong is obsolete, just as the *Lady Bountiful* stereotype of volunteers is also obsolete. Such a traditional, *Angelic flat-earth NPS paradigm* (Smith 2016: 40–41) is very narrow, nonobjective, self-serving, and simply false, given the abundant evidence of deviance and misconduct in the NPS both by individuals in NPOs and by whole NPOs, especially as DVAs.

In place of this Angelic flat-earth NPS paradigm, a more objective, broader, more comprehensive, *round-earth paradigm* for voluntaristics research and theory is clearly needed. The author (Smith et al. 2016b: 1373–1375) has sketched the outlines of the new paradigm needed. Such a round-earth paradigm involves looking in a more balanced, thorough, comprehensive, and open-minded way at many phenomena of the NPS where flat-earth paradigms still dominate in most prior and current research and theory in our interdisciplinary voluntaristics field. This suggested paradigm shift regarding the Dark Side of the NPS may be properly seen as one of several needed round-earth paradigm shifts if we are to fully understand the NPS and its varied phenomena objectively, especially all of its NPOs.

In addition, viewing DVAs generally, and Dissenting DVAs in particular, as the *Dark Energy* of the NPS further elaborates on the recently proposed concept of *volunteerism as energy*. Not all such natural and potentially renewable volunteer energy has positive intent or outcomes for society, however attractive it may seem to certain volunteers involved. The Dark Energy of DVAs manifests volunteerism for goals and activities that most or many in society *at the initial time of DVA origins* and often for decades thereafter would consider to be deviance or misconduct. But when *Dissenting* DVAs are involved, the long-term result is often societal progress and ethical evolution, not persisting or widespread harm to the general population.

Increased empirical research and theoretical attention to NPO Dark Side phenomena, especially to DVAs, can probably best be achieved by a fundamental paradigm shift in our

interdisciplinary field and emergent academic discipline of voluntaristics research. The prevailing, positively biased, boosterism that relentlessly views the NPS and NPOs through *rose-colored glasses* does not serve either our interdisciplinary research field or the NPS itself in the long run. The time has come for most voluntaristics and NPO researchers to recognize the need for a paradigm shift in this area. The result will likely be many new hypotheses and much new research that illuminates all aspects of the NPS and NPOs, as with Kuhnian paradigm shifts in other fields of science.

# Mission Change in Nonprofit Organizations

David Berlan
Florida State University, Tallahassee, FL, USA

## Synonyms

Mission creep; Mission drift; Mission stretching

## Definition

A shift in the fundamental public purpose of a nonprofit or nongovernmental organization.

## Introduction

Nonprofits exist to pursue specific public purposes, their missions. A nonprofit mission thus serves as justification for all nonprofit activities and as the source of their legitimacy. It occupies the dominant position for justifying nonprofit

activities, defining nonprofit social value, distinguishing the sector, and establishing differentiation between organizations. Missions influence strategy, goals, programs, and motivation and mobilization of stakeholders. Nonprofit missions are most clearly visible in formal mission statements but may also appear in other formal or informal forms. Formal mission statements are written as nonprofits are founded and serve as critical documents in applications for tax exemption. These statements may later be revised, but even when they remain intact, a nonprofit's mission may still change.

Nonprofit mission change is in short any significant alteration in the specific public purpose being pursued by a given nonprofit. This is not the same as a change in strategy, which emphasizes the means by which the organization is seeking to accomplish its mission, or even a revision of a formal mission statement, which is neither necessary nor sufficient for an act of mission change. Whenever a nonprofit shifts from its previous public purpose, however this happens, mission change has occurred. Revisions of a formal mission statement may occur before, after, concurrent with, or separate from a change in the organization's mission. Similarly, mission changes may be independent from or tied to other changes in the nonprofit, such as funding, leadership, strategy, or structural changes.

Nonprofit mission statements are products of a writing process and are not necessarily readdressed frequently. As a result, over time they may lose their relevance to the nonprofit's current focus. There is also evidence that these statements are written in manners that leave them overly broad and sometimes intentionally vague. Either case can leave the formal mission statement as insufficient for laying out the nonprofit's actual mission. As such, these statements are subject to interpretation that can address this challenge. Individuals in the organization may reach different understandings of what the mission statement implies for the work of the organization and for what its underlying mission truly seeks to accomplish.

Beyond the internal pressures applied to nonprofit missions by those who understand them differently or may seek to make a mark on the organization, external pressures incentivize shifts away from the original purpose. Although most scholarly attention to these pressures focuses on economic pressures, missions can also be subject to isomorphic forces from other external sources that influence both deliberate and subtle forces by exposing individuals to different sources of ideas. Though these forces could apply the same pressures to encourage fidelity to mission, they are more likely to spur shifts away from nonprofit public purposes and toward economic survival. When leaders of nonprofits end up influenced by these forces, the nonprofit's mission can change, most often in a manner that shifts it further away from serving its original purpose.

Mission change takes a wide variety of forms, and although much of the literature subjects these changes to criticism, they can also be forms of healthy adaptation by nonprofits. Finding a balance between responsiveness to the environment and fidelity to nonprofit public purposes is a critical role for nonprofit managers and boards, making mission change an important subject for scholarship and practice alike.

## Internal Dynamics of Mission Interpretation

The formal mission statements of nonprofits typically leave the room open for interpretation and differing internal perspective on how to understand and achieve the nonprofit's mission. Even the concept of mission for nonprofits itself is open to debate, with little or no agreement on how to create or evaluate them (Phills 2005). Further, nonprofit missions are entangled with other fundamental ideas that shape nonprofits, including values, identity, culture, and strategy. As a result, processes of mission interpretation, whether conscious or not, can be expected as natural features of nonprofit management. These processes of interpreting mission both establish an avenue by which organizations can assert fidelity to mission and the potential for significant changes in nonprofit mission (Berlan 2013).

Vague missions can easily abound, with nonprofits designing their formal statements to

provide significant room for adaption, shifting priorities, and the pursuit of multiple goals. Broad framing of missions is common and limits the ability of missions to provide guidance on strategy and operations (Phills 2005). This widespread tendency toward vague missions may arise from conscious decisions, such as sacrificing clarity for flexibility, or unintentional results of statement crafting, such as unfocused writing. Leaders can exacerbate the impact of vague mission or use them to their advantage, either by making existing missions broader or fitting new purposes within the existing mission (Moore 2000).

Divergent values among those in a nonprofit can further create opportunities for missions to be interpreted differently or for internal strains to arise around defining or changing the mission. Organizational values are typically considered as distinct concepts in their own right (Padaki 2000; Voss et al. 2000); they, along with vision statements, sometimes get confused with or wrapped into a nonprofit's mission (Phills 2005). These fundamental ideas can also overlap, or even comprise, yet another, organizational identity (Young 2001). Variations in values and interpretation of mission, vision, or identity among board members, managers, staff, volunteers, and key external stakeholders like beneficiaries and funders make the mission itself subject to potential conflict and change. They also raise the possibility of nonprofits adapting through interpretation that leaves the current mission intact and avoids a change. Nonetheless, the presence of these potential differences in mission and related ideas among key nonprofit actors opens a window for external pressures to potentially encourage mission change.

## External Pressures to Change Missions

Nonprofits balance the pursuit of their mission's public purpose with ensuring sufficient financial resources for the organization to survive and thrive. This tension leads to one of the strongest pressures on nonprofits to change their missions. Most attention to mission from scholars and practitioners alike has identified the need to balance mission and finance, along with distinct pressures deriving from government agencies, foundations and other major funders, commercialization, and competition. Pressures deriving from exposure to other ideas also exist that can lead nonprofits to emulate peers or conform with external norms or standards. Prior scholarship recognizes the impact of organizational and mission characteristics on how nonprofits respond to this pressure.

Several organization theories identify potentially influential variables and processes that could lead to nonprofit mission change. Of particular relevance are resource dependence and new institutionalism. These theories primarily view processes of a change through a lens in which external actors or forces exert pressures for nonprofits to change their missions, and some are able to resist due to organizational characteristics or internal dynamics.

Resource dependence focuses on how nonprofits (and other organizations) seek to secure critical scarce resources necessary for their existence and work. This theory is widely used in nonprofit management and relevant to mission change. Evidence is particularly strong of major funders, including corporations, foundations, government agencies, and wealthy individuals, exerting influence that seeks to shift nonprofit priorities (Froelich 1999). Commercialization, competition, and the pursuit of new revenues sources like earned income strategies also exert similar pressures (Jones 2007). Even where research does not directly address changes in mission, significant pressures have been observed that alter nonprofit strategy, programming, and advocacy efforts, which also could be viewed as a mission change. Resource dependence introduces sources of power for both nonprofits and those who provide their resources, which could explain how some nonprofits, such as those with access to a wide range of potential resource sources or particularly strong claims to legitimacy, can more easily push back against pressures from funders (Froelich 1999).

New institutionalism places emphasis on symbols, legitimacy, and the development of institutions influenced by these ideas. For nonprofits, mission fulfills a key symbolic role and contributes to organizational legitimacy. Development of

organizational myths, which may be driven by processes of mission interpretation or value conflict, shapes the types of change an organization may be willing to undertake (Meyer and Rowan 1977). As an important symbol and influence on the institution over time, mission itself is subject to pressure to change, which could derive from isomorphic forces that encourage similarity between organizations. Isomorphism's inventors DiMaggio and Powell (1983) explained that it would include coercive pressures from government regulation or explicit funder mandates, mimetic pressures from nonprofits engaging with or emulating 'successful' peers, and normative pressures deriving from industry practices, societal norms, and the expectations from the professional backgrounds of individuals in the organization. Nonprofit-specific research has observed some of these, including explicit pressures from government, pressures to alter values in response to collaboration with peers (Voss et al. 2000), and the influence of nonprofit professionalization on the sector (Hwang and Powell 2009).

New institutionalization, like resource dependence, observes some factors that make some organizations more or less resistant to pressures to change. Newer organizations are potentially more subject to pressures, while organizations with greater financial resources see mixed results (Minkoff and Powell 2006). Nonprofits with broader missions can adapt more readily without formally changing their mission, while those subject to external mandates come under greater pressure to change (Minkoff and Powell 2006). Nonprofits that take symbolic steps to reaffirm and reiterate their mission in governance and strategic planning can also limit the influence of pressures to shift. Further, there is evidence that nonprofit missions are relatively stable in the face of pressures to change, such as those from network ties, making changes less common than might be anticipated (Koch et al. 2015).

These theories, combined with internal dynamics that open avenues for potential changes, suggest that mission change occurs through complicated processes influenced by a range of factors. Characteristics of missions themselves leave them more of less susceptible to change, isomorphic forces exerts pressures to emulate similar organizations, powerful external actors seek to influence goals of nonprofits to mirror their own, and organizational characteristics influence the ability to resist. Due to this complicated model of change, processes by which nonprofits change missions, or not, and the resulting form of change vary widely.

## Process and Forms of Mission Change

Nonprofit mission change varies widely, both in the process by which change occurs and the resulting outcomes. In a comprehensive examination of nonprofit mission change, Minkoff and Powell (2006) identify five distinctive pathways by which change occurs. Their first pathway, accommodation, reflects conservative instincts of organizations as they age and become less willing to take risks. Accommodation suggests a combination of resource dependence and institutionalization, wherein comfort with existing resource sources, the mission's symbolism, and current institutional myths leave the nonprofit reluctant to try new ideas or shift in ways that could alienate funders.

The second, proactive change, occurs when organizations move counter to external pressures and typically become more radical. This pathway would appear to repudiate parts of both organization theories by rejecting funder pressures and isomorphic forces driving conformity. It may have roots in the importance of the organization's myth, especially if it is one of radical actions, or in how those within the organization interpret its mission. The third, resistance to change, derives from efforts to maintain the original intent. This fidelity to the mission could occur in organizations with characteristics supportive of resisting external pressures but could also result from internal dynamics of competing interpretations of mission that end up favoring original intentions.

The fourth, reorientation, finds a middle ground between fidelity and responsiveness by adhering to some core values while adapting to environmental pressures. Almost any combination of factors and processes from theory and

prior scholarship could lead to these results, which could themselves vary widely. The final pathway, displacement, finds nonprofits shifting, often drastically, from their original intentions in the pursuit of organizational survival. Displacement aligns most clearly with resource dependence or coercive isomorphism and reflects perceptions that survival outweighs the organization's original public purpose.

Each of these pathways, like resource dependence and new institutionalism, views the process of deciding whether and how to change as integrated with external pressures of some variety. It is also possible for nonprofits to change absent any significant external pressure. This may result from a value conflict (Padaki 2000), efforts to develop a shared organizational identity (Young 2001), or some other form of mission reinterpretation or revision. This leads to a sixth pathway mostly or completely disentangled from the two organization theories. This pathway of internal shifts, much like reorientation, could result in a wide range of new missions.

## Conclusion

Nonprofit missions are subject to pressure to change, whether from internal dynamics of interpretation, external pressures to conform, or unintentional processes of imitation. Though mission change is often criticized and labeled with terms like mission "drift" or "creep" with unspoken pejoratives, this need not be true, as observed in some pathways of change. Though nonprofit mission change is relatively rare or difficult to observe in research, it has the potential to drastically impact nonprofits, whether for better or worse. Positive changes could include positioning a nonprofit to continue making significant contributions, such as the March of Dimes broadening its focus in the wake of polio eradication in the USA, or responding to beneficiary needs. Negative changes could include chasing new funding in ways that harm programs or shifts threatening the organization's founding values, as arguably could be the case when nonprofit hospitals become for-profit or sell to a hospital chain. It can be difficult to immediately decide the impact of a mission change, such as National Geographic selling its media activities to Twenty-First Century Fox, which shows an abandonment of nonprofit values for those programs but may also reflect narrowing its focus toward its most charitable activities.

By altering their fundamental public purposes, nonprofits that undergo mission change transform their reason for existence, source of legitimacy, and primary goals. Even minor changes can have lasting and substantial effects. In particular, changes of this significant nature bring new risks to organizations, including the possibility of failure and organizational death. This new source of risk conflicts with the most prevalent, at least in nonprofit scholarship, source of pressures to change mission: the acquisition of resources tied to other goals. Nonprofits changing their mission in anticipation of gaining or maintaining more resources counterintuitively may also increase their potential for catastrophic outcomes, in part by undermining prior support and claims to legitimacy.

Nonprofit leaders and boards must thus take special care when considering any organizational change that could alter their mission. Though such changes may be critical responses to changing environments or sources of new innovations drastically improving the organization's ability to effect societal change, they can threaten organizational survival, erode nonprofit sector values, and hamper pursuit of public purposes. This should not lead practitioners to automatically reject the possibility of change or scholars to label and consider all changes undesirable mission drift but instead requires that mission be paid greater attention and its potential and process for change be carefully examined and undertaken. Nonprofit mission change is arguably the most impactful, and dangerous, form of organizational change.

# Mission, Vision, and Organizational Values

Terrie Temkin
CoreStrategies for Nonprofits, Inc, Miami, FL, USA

## Synonyms

**Mission**: purpose, raison d'être, goal, aim, duty, pursuit; **Organizational values**: guiding principles, beliefs, tenets; **Vision**: dream, visualization, image, mental picture (all of the future), end result

## Definition

**Mission** is an organization's purpose, what it exists to accomplish.
**Vision** is a picture of how the community will be not only different, but also better, as a result of the organization having accomplished what it set out to do.
**Organizational values** are guiding principles for organizational behavior.

## Introduction

Mission, vision, and values are terms frequently used in the nonprofit or nongovernmental organization (NGO) sector by staff, board directors, volunteers, clients, donors, community leaders, and other stakeholders, as well as consultants, college professors, planning professionals, and authors speaking or writing about the business of nonprofits/NGOs. Unfortunately, all too often, these distinct terms are used interchangeably or misused altogether. This results in confusion not only for those working within organizations but also for those working across organizations.

Contributing to the confusion around the meaning and use of each term is that the favored formats for each have changed over the years. For instance, prior to the mid-1970s when the late management guru Peter Drucker declared mission

statements should not exceed seventeen words, they typically ran for a page or more. Today, there are some calling for mission statements of no more than eight words, claiming people's attention is limited to "who" (the target population), a verb, and a measurable outcome (Starr 2012).

This entry provides the most commonly accepted definitions of the three terms and indicates how they are typically formatted. The benefits to and uses of mission, vision, and value statements in nonprofits/NGOs are also presented, along with when it is appropriate to make changes to them.

## Defining Mission, Vision, and Values and Their Content

### Mission

Mission is an organization's purpose, its raison d'être. A mission statement specifies what the organization is uniquely in business to do.

Some believe it should also indicate where you do your work and for whom, why the purpose is important, and how the organization will go about accomplishing its work, or say something about the culture of the organization. Others argue that the "why" is found in the vision and values, and including the "how" can be unnecessarily limiting because over time an organization may want or need to change its approach. In addition, both "why" and "how" make the mission statement longer and, thus, harder to recall. Since awareness of an organization is enhanced if anyone who cares about an organization can cite its mission statement – whether that be a staff member, board director, client, funder, vendor, or community stakeholder – an argument may be made for keeping the mission statement short.

Despite the pleas for and benefits of brevity, a mission statement is *not* the same thing as a tag line, which is a marketing tool in the form of a proclamation. An example should clarify this. The United Way is an organization that for more than 125 years has brought "people, organizations and communities together around a common cause, a common vision, and a common path," traditionally raising money to accomplish its goals through workplace giving. It pursues its mission "to improve lives by mobilizing the caring power of communities around the world to advance the common good," through the efforts of individuals operating in close to 2000 communities in more than 40 countries. Its tag line is "Live United" (UnitedWay.org). There is clearly a relationship between the mission and the tag line. The first statement gives the "what" – "United Way exists to improve lives and advance the common good." In this case, it also indicates how the organization intends to accomplish its task – "through mobilizing the caring power of communities." The second statement, "Live United," does not state the reason behind the United Way's existence. Rather, it is a rallying cry for the community to come together under the unifying banner of the United Way.

### Vision

The mission statement is important. The community expects to see it in the organization's publications. Funders expect to see it in grant applications. Board directors expect to use it when talking with friends, family, and associates about their involvement with the organization. However, as an articulation of the desired, more perfect, more impactful future that the organization is targeting (Nanus 1992), many believe that vision may actually be more critical than mission. This is because, when drawn well, the verbal picture that is painted of how the community will be stronger or healthier as a result of the organization having accomplished what it set out to do can be transformational. It creates excitement and inspires people to join the organization in making that vision a reality.

The key to the development of an effective vision statement is to focus on desired changes to the *community* rather than the organization (Gottlieb 2008). Returning to our United Way example, employees at, say, Centraide of Greater Montreal (United Way Montreal) might gain a sense of pride if the organization becomes the largest and most influential United Way in the world or if it allocates more grants than any other United Way. Such expressions of vision

will not, however, encourage others outside the organization to step up to become a part of its journey. The reason is that potential stakeholders want to see themselves included in the vision, benefitting from the organization's success. A vision where all residents, regardless of age, socioeconomic class, education level, race, ethnicity, or level of ability, live healthy, active, and connected lives is far more likely to attract them. This community impact view of vision is powerful.

Presenting the vision in the present tense – as mission accomplished – is also valuable. It not only helps everyone more easily visualize the desired future, it helps them identify with the organization's work. Consider a real-life example from the United States. A group that serves to reintegrate ex-offenders into society was contemplating how best to phrase its vision statement. It knew what it wanted to say, but debated between: "The formerly incarcerated *will become* good citizens and neighbors – productive, educated, with strong family and spiritual values, playing an equal role in contributing to a safe and vibrant community," and "The formerly incarcerated *are* good citizens and neighbors – productive, educated, with strong family and spiritual values, playing an equal role in contributing to a safe and vibrant community." The only difference between the two statements is the tense. In the first case, the vision was future-focused – i.e., "the formerly incarcerated *will become* good citizens." In the second case, the vision was present-focused – i.e., "the formerly incarcerated *are* good citizens." After hearing the first vision statement, members of a focus group expressed fear of individuals who were *not yet* good citizens and neighbors, and they made it clear that they did not want ex-offenders living in their neighborhood. When presented with the second statement, the responses were more welcoming. People saw individuals with whom they could identify – people like themselves who had the background and desire to contribute to their neighborhoods. They suddenly understood that they had a vested interest in helping the organization rehabilitate the ex-offenders.

### Values

Organizational values speak to a nonprofit or NGO's core beliefs. Different from personal ethics, such as honesty and integrity – which while important are expected of all organizations – they are unique guiding principles for a specific organization's behavior. An adult literacy program, for instance, might choose values similar to these five: One's level of literacy neither defines that individual nor speaks to his/her intelligence. Everyone deserves to be treated with equal levels of respect. A literate society improves the quality of life for all. Everyone has the capability of becoming functionally literate. And all persons deserve equal access to literacy training. These examples illuminate the "why" behind how our literacy program would choose to act on its mission.

Expressing values in the manner demonstrated above provides unambiguous direction to board and staff. Decisions become easier to make and explain to others. For example, let us say that through a personal contact a board director of this adult literacy program brought to the organization a grant opportunity. That grant opportunity required the program to focus on only one segment of society to the exclusion of others that could also benefit from the organization's literacy training. The organization would have to pass on the grant opportunity to remain consistent with its values. It could do so with less discussion and fewer hurt feelings because the parameters for the organization's choices had previously been agreed upon.

## Using Mission, Vision, and Values in a Nonprofit

Mission, vision, and values are at the heart of nonprofit governance, particularly transformational governance. As defined by Australian consultant Steven Bowman of Conscious Governance (2013), governance – distilled down to its core – is making the choices that create the desired future for the communities the nonprofits/NGOs serve. As you will read in this section, the three critical tools fulfill this charge in a number of ways.

They can help individuals and groups such as the board and staff stay on target, even when they are operating independently on behalf of the organization. Margaret Wheatley, in *Leadership and the New Science: Learning about Organization from an Orderly Universe*, shares with her readers that all living organisms are self-referencing, which allows them to adapt to changes in their environment in sense-making ways – ways that fit their identity. Putting this biologic reality in organizational terms, identity, which is made up of such things as values, norms, and goals, keeps people on target. In other words, because mission, vision, and values provide a nonprofit or NGO with its identity, they provide participants with the direction and boundaries that allow them to function in a highly directed and more competent manner and, therefore, accomplish more on behalf of the organization (1992).

Mission, vision, and values can help an organization solve problems, as well as avoid mission creep and the waste of precious resources. They do this by serving as a key decision screen against which options can be measured to determine which options have the greatest potential for moving the organization forward in the most expeditious way possible. An organization in Bogotá, Colombia, provides an example. The organization was formed by a group of friends who each had different interests but shared a concern for the environment. One started an ecologically friendly hotel. Another started a restaurant that elegantly and deliciously prepared and served unusual species of plants, fish, and insects from all over the country – such as blow fish and fire ants – that would generally be avoided by even the more adventurous eaters, and therefore wasted. Yet another ran a boutique that sold items made by Colombia's indigenous people. These friends, which constituted the board of directors, were always in different parts of the country following their dreams, making it difficult to do the work of the organization and to prove to the community that it was in fact a legitimate nongovernmental organization rather than merely independent businesses. In addition, it was creating friction when one entity spent more organizational funds than another. When the group came together to evaluate and restate its mission, vision, and values, they agreed significant changes needed to be made to be in alignment with their ultimate goals. These changes included dropping one of their projects.

The three tools can help attract and retain support. They can also impact performance. Brown and Yoshioka (2003) found mission to motivate employees in nonprofit organizations and keep them focused. A few years later, Brown, Hillman, and Okun (2012) found passion for mission to positively influence the level of board directors' confidence and participation in their tasks. In a 1992 study by Bradshaw, Murray, and Wolpin, nonprofit CEOs reported sensing a correlation between shared vision and organizational effectiveness. And Paarlberg and Perry's 2007 research showed that strategic or organizational values are motivating, especially when those values are in alignment with people's personal values.

The regular use of mission, vision, and values can also help mitigate one of the most sensitive issues in nonprofits/NGOs – Founder's syndrome. Too often, as an organization becomes more sophisticated, the organization's original visionary and driving force remains in place beyond the point where he or she is still capable of providing the increasing level of leadership needed. This situation usually occurs because the founder is fearful that his or her vision will be lost if someone new is allowed to come in. An established culture of using mission, vision, and values to make every choice is reassuring. The founder is more likely to relinquish significant power, or walk away entirely, when he or she consistently experiences the board and staff regularly preserving what he or she identified as important early on. It becomes easier for that person to accept that incoming leadership will not take the organization in a totally different or unacceptable direction.

Mission, vision, and values are essential considerations when exploring collaborations. It is hard to maintain any relationship without shared values. And it is impossible to work together long term if the collaborative parties are not interested in the same general outcome. Jane Wei-Skillern and Sonia Marciano (2008) list three factors required for successful collaborations in "The Networked Nonprofit." The first is that the partners must put the mission of the collaboration before that of their own organization. That might

mean relinquishing credit or a share of funds if achievement of the vision requires it. Second, the partners have to value trust over control. They have to believe that each partner is committed to doing the right thing for the shared mission and not try to second-guess decisions made by another. And, third, they must see themselves as part of a true team that works together seamlessly, with no one person or organization carrying more weight than any other. These are not easy commitments to make in the real world. Taking the time to discuss at length each organization's views on the mission, vision, and values of the collaborative prior to entering into an agreement can help bring the above to fruition. It can also prevent the untimely emergence of a lot of difficult issues that can destroy not only the collaboration but potentially the project and the community's trust in the organizations involved.

Finally, it is much easier to approach potential corporate partners for support when those corporations share a similar vision with the organization, and their values are aligned. Very few businesses today, especially in the United States, are donating to organizations merely to prove themselves good corporate citizens. With often more nonprofits or NGOs approaching the finite number of corporations in their communities than the corporations can realistically or adequately support, corporations want to ensure that any donations they do make, including donations of time, skills, or materials, add to their bottom line in some way. It falls to the nonprofits or NGOs to differentiate themselves and to demonstrate the value to both parties of a partnership.

Cause-related marketing is based on this reality. The classic example from the United States is Tylenol and the Arthritis Foundation. In the mid-1990s, the Arthritis Foundation allowed bottles of the pain reliever Tylenol (and three other brands manufactured by the same drug company) to carry its name and logo in return for a guarantee of $1 million (US) for research. In addition, the boxes in which the bottles were packaged contained information about arthritis and the Arthritis Foundation. The drug company benefitted from the implied endorsement and the potential for an introduction to new customers. The Arthritis Foundation benefitted from the research dollars and the additional channel through which they could promote their services to individuals who may not have known where to turn for advice on their condition.

But cause-related marketing is not the only type of partnership that can be forged when it can be shown that the mission, vision, and/or values of both parties overlap. A business that requires a workforce with specialized skills might want to support a nonprofit/NGO that provides educational opportunities in that specialty area to youth or adults interested in gaining those skills. Or an entrepreneur struck by a disease might want to partner with a voluntary health organization dedicated to eradicating that disease.

As valuable as mission, vision, and values can be to an organization, they are only effective if they are referenced regularly enough that reliance on them becomes second nature. One way to remind decision-makers to keep mission, vision, and values in mind is to list them at the top of every agenda. Whoever is chairing the particular meeting can also allude to them in the welcome remarks. Appointing a "mission caller" is beneficial as well. This is someone assigned to constantly challenge the group: "Is this consistent with our values?" "Will this move us closer to our vision?" "Is this suitable given our mission?" Such simple questions keep everyone focused on what they have agreed is important. To prevent others from tuning out a voice that becomes too familiar, consider choosing a different person as the mission caller at every board, committee, or staff meeting (Temkin 2015).

## Changing the Organization's Mission, Vision, and Values

While many organizations change their mission and vision statements every time a new board chair is elected or a strategic plan is undertaken, the trend is to take a longer view. This trend is supported by the results of the 2012 study *Beyond the Cause: The Art and Science of Advocacy* by Independent Sector, which found that a 30-year view is more effective than the shorter timeframes most organizations work within when significant change is desired. Independent Sector, an

organization representing the research needs and public policy interests of an international network of nonprofit, foundation, and corporate leaders committed to advancing the common good, analyzed the success of the Human Rights Campaign, Americans for Tax Reform, and General Electric. What it learned was that in each case, the organizations set a "BHAG" – a big, hairy, audacious goal – that they fully realized would take decades to accomplish.

The Human Rights Campaign (HRC) makes a good example. It wanted recognition and equality for the lesbian, gay, bisexual, transgender, and questioning or queer (LGBTQ) communities, which at the time the HRC set this vision regularly risked losing family, friends, and jobs because of their sexual orientation. Leaders from the HRC went to Hollywood and asked screenwriters to add parts for gays and lesbians to television scripts, specifying that the parts portray these individuals as any other character in the stories – as brothers, sisters, doctors, and lawyers. Change did not happen overnight, but seeing acceptance in the media, more and more members of these communities left the closet, and it became more common for their families, friends, and employers to embrace them. Today, in what appeared to occur in record time for such a large social change, gay marriage is legal across the United States and in many other countries around the world. Vision achievement came from never losing sight of the ultimate goal. This meant identifying indicators of success and establishing an action plan with specific strategies and tactics, as well as contingency plans.

There are times when deviation from the long view is appropriate or even essential, such as when an organization's reason for existing is no longer relevant or compelling. This was the case with the March of Dimes. The March of Dimes was founded by US President Franklin D. Roosevelt in 1938, as the National Foundation for Infantile Paralysis to fight the devastation of polio – a disease with which Roosevelt himself lived. With the advent of the polio vaccines, the disease – which at its peak in the mid-twentieth century killed or paralyzed a half-million people throughout the world annually – literally disappeared overnight. With its mission accomplished, the organization opted to shift its focus to the eradication of birth defects rather than disband. But these types of cases are relatively rare.

## Conclusion

Mission, vision, and values are essential tools in the world of nonprofits/NGOs and are the bases of its governance. Each is unique. The mission communicates what the organization exists to do, the vision what its picture of the future is and what it means for the community it serves, and the organizational values what principles will guide its actions. However, when formulated carefully and used together on a regular and consistent basis, they provide motivation, long-term direction, a focus for meetings, a screen for decision making, a way to ensure stability in operations, a bonding device for working with others, and more.

# Mixed Scanning Model of Decision-Making in Organizations

Amitai Etzioni
The George Washington University, Washington, DC, USA

## Synonyms

Decision-making models

## Definition

Mixed scanning is a hierarchical mode of decision-making that combines higher-order, fundamental decision-making with lower-order, incremental decisions that work out and/or prepare for the higher-order ones.

## Introduction

Mixed scanning is a hierarchical mode of decision-making that combines higher-order, fundamental decision-making with lower-order, incremental decisions that work out, and/or prepare for the higher-order ones. The term "scanning" is used to refer to search, collection, processing, and evaluation of information as well as to the drawing of conclusions, all elements in the service of decision-making. Mixed scanning also contains rules for allocation of resources among the levels of decision-making and for evaluation, leading to changes in the proportion of higher versus lower levels of scanning based on changes in the situation.

## Background

The term and concept was introduced by Amitai Etzioni in an article on mixed scanning as a "third" approach to decision-making, published in the *Public Administration Review* (December 1967), which was awarded the William Mosher Award. It generated a stream of discussion, criticisms, and applications.

For example, chess players, unable to review all the options (Haynes 1974, pp. 7–8) and seeking to do better than merely think one or two steps ahead, running from trouble or toward a seeming opportunity, divide their time and psychic energy between first deciding among fundamental approaches ("ready to attack" vs. "need to further develop the forces"; "attack on the queen, or king, side") and then examining in detail options only within the chosen approach. (In effect, this form

M

of scanning may take place on more than two levels, e.g., choosing a major strategy and a sub-strategy and then examining in detail some options within that sub-strategy.)

Rules for allocation are illustrated in chess when the game must be completed within a given time period. Players will then engage in less higher-level scanning, i.e., allot it less time, as the game progresses, although it may be granted "extra" time if the strategy followed runs into difficulties. This approach is less demanding than the full search of all options that rationalism requires and more "strategic" and innovative than incrementalism.

Mixed scanning is akin to scanning by satellites with two lenses: wide and zoom. Instead of taking a close look at all formations, a prohibitive task, or only at the spots of previous trouble, the wide lenses provide clues as to places to zoom in, looking for details. In the years that passed, a new technology was developed which applies the "double-lens" approach of mixed scanning, Decision Information Discipline System (DIDS). The system provides computer graphic displays of geodata, usually in the form of a map. The system has a zoom capacity that allows its users to zero in instantaneously on subunits (or subsets of variables), for example, states within the USA and counties within the states.

Wallace (1983) studied the ten uses of the system as instances of mixed scanning. In one case a wide scan established that some areas were losing population although they were in parts of the county that by general trends should have been experiencing population growth. The zoom revealed these to be places in which military bases were being closed. In four, possibly five, of the ten cases, the approach led to what Wallace calls "unexpected" findings (p. 318). The broad scanning was more economical than detailed (zoom-in) scanning of all counties. At the same time, the zoom-in scanning of counties, singled out by the broad scanning, prevented the loss of information that would have ensued if only broad scanning would have taken place.

## Operationalization

A significant part of the works that followed the publicity of the original article spelled out the mixed scanning model in programmatic terms, terms that can be used as a guide for decision-makers, as a starting point for a computer program, and as a basis for research designs. Etzioni (1968, pp. 286–288) started this elaboration:

(a) *On strategic occasions* (for definition see d below):
   (i) List all relevant alternatives that come to mind, that the staff raises, and that advisers advocate (including alternatives not usually considered feasible).
   (ii) Examine briefly the alternatives under (i) (for definition of "briefly," see d below), and reject those that reveal a "crippling objection." These include (a) utilitarian objections to alternatives which require means that are not available, (b) normative objections to alternatives which violate the basic values of the decision-makers, and (c) political objections to alternatives which violate the basic values or interests of other actors whose support seems essential for making the decision and/ or implementing it.
   (iii) For all alternatives not rejected under (ii), repeat (ii) in greater though not in full detail (for definition of scale, see d).
   (iv) For those alternatives remaining after (iii), repeat (ii) in still fuller detail (see d). Continue until only one alternative is left, or randomize the choice among those remaining (and ask the staff in the future to collect enough information to differentiate among all the alternatives to be reviewed).

(b) *Before implementation*:
   (i) When possible, fragment the implementation into several sequential steps (an administrative rule).
   (ii) When possible, divide the commitment to implement into several serial steps (a political rule).

(iii) When possible, divide the commitment of assets into several serial steps and maintain a strategic reserve (a utilitarian rule).
(iv) Arrange implementation in such a way that, if possible, costly and less reversible decisions will appear later in the process than those which are more reversible and less costly.
(v) Provide a time schedule for the additional collection and processing of information so that information will become available at the key turning points of the subsequent decisions, but assume "unanticipated" delays in the availability of these inputs. Return to more encompassing scanning when such information becomes available and before such turning points.

(c) *Review while implementing*.
(i) Scan on a semi-encompassing level after the first subset of increments is implemented. If they "work," continue to scan on a semi-encompassing level after longer intervals and in full, overall review, still less frequently.
(ii) Scan more encompassingly whenever a series of increments, although each one seems a step in the first direction, result in deeper difficulties.
(iii) Be sure to scan at set intervals in full, overall review even if everything seems all right, because (a) a major danger that was not visible during earlier scanning but becomes observable now that it is closer might loom a few steps (or increments) ahead; (b) a better strategy might now be possible although it was ruled out in earlier rounds (see if one or more of the crippling objections was removed, but also look for new alternatives not previously examined); and (c) the goal may have been realized and, therefore, need no further incrementation. If this occurs, ask for new goal(s), and consider terminating the project.

(d) *Formulate a rule for the allocation of assets and time among the various levels of scanning. The rule is to assign "slices" of the available pie to*:
(i) "Normal" routines (when incrementing "works")
(ii) Semi-encompassing reviews
(iii) Overall reviews
(iv) Initial reviews when a whole new problem or strategy is considered
(v) A time "trigger," at set intervals, to initiate more encompassing reviews without waiting for a crisis to develop
(vi) An occasional review of the allocation rule in the overall review and the establishment of the patterns of allocation in the initial strategic review

Janis and Mann (1977, p. 37) introduced a major improvement of the program. They point out that while in the initial scanning, all those options that have no "crippling objections" are held over for closer scanning, which amounts to a "quasi-satisficing" approach, "each time the surviving alternatives are reexamined, the testing rule might be changed in the optimizing direction by raising the minimum standard (from crippling objections to more minor objections)."

Starkie (1984, p. 75) concurs with Etzioni that a mere accumulation of numerous incremental changes is not expected to yield the equivalent of a contextual or fundamental decision, because the incrementalist model provides no guidelines for the accumulation; it is likely to be random or scattered. In contrast, in mixed scanning, the fundamental decisions provide such guidance. Starkie correctly points out Etzioni's suggestion that an "incremental 'creep' followed by a sudden change when existing policies are no longer sustainable by modification alone" is but one possible pattern of a combination of incremental and fundamental decisions; incrementation may follow a fundamental decision, just as readily as the other way around. Chadwick (1971) relates the various methods of decision-making to different purposes and techniques of decision-making. He sees rationalism as related to attempts to explore the long

range and sees its techniques as either normative forecasting or exploration and simulation, that is, lacking in empirical content. He sees the purpose of mixed scanning as the "provision of alternative sets of action policies," using evaluation, the design methods, and something he calls "planning balance sheet" (p. 340). No details are provided concerning these techniques, and Chadwick's endorsement of mixed scanning "as a highly acceptable meta-procedure" is based on his judgment that it is flexible but not on an empirical study. "When applying the mixed scanning framework to this chapter, one could argue that a broad, strategic analysis of the transport capacity of the transport corridor will fail to take into account specific, interrelated chokepoints at the local level. For example, the impact of noise protection measures resulting from national legal structures. At the same time, a regional strategy for a certain transport node will neglect the impacts of border-crossing problems on the transport corridor at the transnational level. Mixed scanning is able to tackle these problems." (Patrick A. Witte and T.J.M Spit *4 Sectoral Drawbacks in Transport: Towards a New Analytical Framework on European Transport Corridors*. (Utrecht University) Jan. 2014. p. 53. https://www.researchgate.net/publication/280489809_4_Sectoral_Drawbacks_in_Transport_Towards_a_New_Analytical_Framework_on_European_Transport_Corridors).

All three approaches to decision-making are not only positive, in the sense that they claim to describe the ways decision-makers actually act, but are also normative approaches in that they prescribe how effective decisions ought to be made.

For a criticism, Dr. Jones Adu-Gyamfi writes:

> *In the exploration of mixed-scanning*, Etzioni (1967) *distinguishes between fundamental and incremental decisions. According to him, fundamental decisions set the context for incremental ones and are 'made by exploring the main alternatives the actor sees in view of his conception of his goals...but details and specifications are omitted so that an overview is feasible'* (Etzioni 1967: *389–390*). *It is very difficult to comprehend the distinction between fundamental and incremental decisions. Although Etzioni reiterates that incremental decisions are set on fundamental ones, he also states that 'fundamental decisions are frequently "prepared" by incremental ones in order that the final decision will initiate a less abrupt change'* (Etzioni 1967*: 387*). *He leaves readers confused about whether the final decision is fundamental or incremental. In a later article, he attempted to answer how a fundamental decision could be distinguished from an incremental decision (Etzioni, 1986). He outlined that one way of differentiation is to look at relative size. As a rule of thumb he used 10% or less change i.e., if a decision results in less than 10% changes to budget, then it could be described as incremental, whereas a more than 10% change would be a fundamental decision. It is worth noting that this 10% rule is difficult to substantiate as many policy decisions do not result in changes to budgets. Another way to differentiate between fundamental and incremental decisions outlined by Etzioni (1986) is 'checking for a nestling relationship' (p. 10). He argued that 'if an incremental decision requires or draws on a contextual decision, this is the fundamental one' (p. 10). He did not however elaborate on what 'nestling relationship' means or what a 'contextual decision' is. He thus seems to introduce more concepts to confuse rather than clarify.* (Jones Adu-Gyamfi. *Barriers to Children and Young People's Participation in Policy Making in Ghana*. (University of Bradford) Sept. 2015. p. 4.)

Rationalism assumes an all-powerful actor, as reflected in the notion that actors ought to set their goals and set about implementing them, without asking about their place in various power hierarchies or the strategies needed to deal with them. For instance, a subordinate may need to act differently than a high-ranking executive. Incrementalism is most compatible with the acceptance of existing power relations. Mixed scanning sensitizes the decision-maker to taking into account other actors; one of the major factors scanning encompasses is the posture of other actors and the relations among them.

The structural element received little attention in the more than 50 publications that deal with mixed scanning, possibly due to a widespread tendency to treat decision-making as a disembodied strategy.

## Conclusion

Mixed scanning seems to have an intuitive appeal to a fair number of scholars and action-oriented

students of decision-making. The ways it might be operationalized for the purpose of research or implementation have been clarified over the years, and the essential difference between fundamental and incremental decisions seems not to pose great difficulties. The links between the three different approaches of decision-making and various intra- and interorganizational power structures, as well as between power approaches and consensus building, have been explored. However, it remains to be empirically substantiated if, indeed, rational models are more suitable for totalitarianism or high-power approaches (e.g., master planning); incrementalism to highly pluralistic, special-interest dominated polities; and mixed scanning to systems that combine a balanced commitment to the collectivity with pluralism (Etzioni 1984). The alternative hypothesis would be that rationalism does not work even for highly centralized systems (as the recent changes in USSR and China suggest) and that incrementalism reinforces the weakness of pluralism without a collective framework. All may require mixed scanning albeit using different mixtures of higher and lower levels of scanning.

Above all, mixed scanning is still very short of case studies and quantitative studies of situations in which decision-making strategies were changed from either rationalist or incrementalist ones to mixed scanning. More needs to be known of the results in terms of effectiveness and of the factors that hindered or fostered the use of mixed scanning.

# Mobilizing Internally Generated Funds by Local Governments in Ghana

Ronald Adamtey and Clifford Amoako
Department of Planning, Kwame Nkrumah University of Science and Technology, Kumasi, Ghana

M

## Synonyms

District Assembly; Fiscal decentralization in Ghana; Intergovernmental transfers; Internally generated funds

## Definition

Internally generated funds are financial resources from licenses, fees and miscellaneous charges, taxes, investment income and rates that local governments are permitted by law to mobilize at the local level for the implementation of their development plans.

## Introduction

Fiscal decentralization can be defined as the process of transferring budgetary authority from

central governments to elected subnational governments in order to grant them powers to make decisions regarding taxes and expenses. Fiscal decentralization generally refers to the devolution of taxing and spending powers from the control of central to subnational government authorities. In a well-decentralized system, local governments have considerable powers to mobilize resources, through taxing authorities accompanied by strong tax regulations. This is the devolution of revenue sources and expenditure responsibilities to lower levels of government (Osei 2017). Thus, it means the transfer of decision-making functions and authority from central government to local institutions regarding the allocation of financial resources (Ankamah 2012). Generally, fiscal decentralization can be summed up as the central government passing budgetary authority to elected subnational governments by empowering them to make essential decisions regarding taxing and spending at their level. This means passing fiscal power to any level of government below the center such as states or provinces, cities or districts as in Ghana.

Fiscal decentralization is needed for the other components of decentralization such as political and administrative decentralization to work and for general decentralization to thrive and lead to achieving the benefits of decentralization which includes improved governance, accountability, democratization and citizen participation, and increased efficiency with regards to service delivery (Ayee 1995, 2004; 2008; Smoke 1994; 2001). Consequently, fiscal decentralization is promoted by many development partners hoping to bring governance and service provision closer to the people and facilitate poverty reduction and public accountability (Awortwi 2010a; Crook 2003). With the argument that fiscal decentralization is a positive driver of subnational government growth and development, this form of decentralization has been supported by leading international development organizations such as the World Bank, the Asian Development Bank, the Organization for Economic Cooperation and Development (OECD), and the United States Agency for International Development (USAID) (Osei 2017; Smoke 2001).

Many countries, both developed and developing, have implemented fiscal decentralization policies in various forms with some successes and challenges (Hankla 2009; Litvack et al. 1998). Russia has reformed its intergovernmental fiscal system to replace ad hoc grants with a formula-based transfer leading to some gains in transparency of the revenue system; though this was not accompanied by increased local discretion in the expenditures. Similarly, South Africa has assigned significant non-property taxing powers to subnational governments, including a payroll and turnover tax, and has granted local governments some borrowing powers. However, the South African government still has not put in place a hard budget constraint for local governments to force efficient use of these instruments. China's 1994 fiscal reform dramatically changed the national revenue sharing system, gave local governments more control over the administration of locally assigned taxes, and changed the balance of revenue availability between the two levels of government. However, no commensurate changes in expenditure assignment were made.

Among the administrative and technical weaknesses in fiscal decentralization common to many countries in Africa and even some more advanced countries are that, tax bases of local governments are static, mechanisms for collecting internal revenues are ineffective, and appropriate sanctions or punishment for tax defaulters are absent (Bahl and Linn 1992). Most residents, especially traders, do not feel obliged to pay local taxes. The cooperation and exchange of data between the local governments and other public institutions and state agencies seems not to function very well. Transparency in fiscal decentralization either remains limited and financial information does not reach or is not understood by the general public.

Failed fiscal autonomy/decentralization derails any local government systems and entrenches the powers of the center and can undermine economic development. When fiscal decentralization is successfully implemented, it will lead to economic development, mobilization of adequate local revenue, effective innovation in public service delivery, accountability of elected local officials to the people, capacity development for local

government officials, and local participation in governance process (Akindele et al. 2002). Given this context, there is the need to have stronger structures and sustainable local revenue base for the success of local government systems. This entry analyzes the implementation of fiscal decentralization program in Ghana as operationalized by five selected District Assemblies.

Central to Ghana's Local Government System is a well-designed decentralization framework backed by regulatory and legal frameworks (see Republic of Ghana 1992, 2016a, b). Article 240 of the 1992 Constitution of Ghana states that Ghana shall have a system of local government and administration which shall, as far as practicable, be decentralized. Article 245 has also stated that the functions of the District Assembly shall include the formulation and execution of plans, programs, and strategies for the effective mobilization of the resources necessary for the overall development of the district, and levying and collection of taxes, rates, duties, and fees. Section 34 of the Local Government Act, 1993, Act 462, states that in line with the implementation of decentralization policy, the Minister shall, by legislative instrument, establish an Assembly for each district, municipality, and metropolis which, in accordance with clause (3) of Article 241 of the 1992 Constitution, shall constitute the highest political authority in the district. Amendment to Act 462 led to the Local Governance Act, 2016, Act 936 which states in Section12, subsection 1 that all Metropolitan, Municipal, and District Assemblies (MMDAs) are mandated to ensure the overall development of areas under their jurisdiction. Consequently, a District Assembly shall exercise political and administrative authority in the district; promote local economic development; and provide guidance, give direction to, and supervise other administrative authorities in the district as may be prescribed by law. In line with this, MMDAs, as the highest political authorities at the local level, are responsible for the preparation of their budgets for the implementation of their respective Medium-Term Development Plans (MTDPs).

In order to deepen the decentralization process and promote socioeconomic development, Ghana implemented fiscal decentralization reforms by entrusting District Assemblies with the authority and capacity to generate, allocate, and utilize financial resources at the local level. The 1992 Constitution of Ghana recognizes the importance of fiscal decentralization and financing of local service delivery. Consequently, Section 240(a) of the Constitution provides that Parliament shall enact appropriate laws to ensure that functions, powers, responsibilities, and resources are at all times transferred from central government to local government units in a coordinated manner. Section 240(2)(c) also recognizes the development role of the Assemblies and emphasizes on the adequacy and reliability of local government financial resources and states that there shall be established for each local government unit a sound financial base with adequate and reliable revenue.

In line with these legal provisions, District Assemblies of Common Fund (DACF) was established by the DACF Act, 1993 (Ac 455), as a major source of development fund to District Assemblies for the implementation of their MTDPs. Among others, the DACF was created to complement the internally generated funds (IGF) of the District Assemblies to undertake development projects. To further deepen the fiscal decentralization agenda and ensure transparency and accountability in the use and control of public financial resources, a number of key legal instruments and regulations have been enacted; these include Ghana Audit Service Act, 2000 (Act 658); Financial Administration Act, 2003 (Act 654); Public Procurement Act, 2003 (Act 663); and Internal Audit Agency Act, 2004 (Act 656).

Available evidence shows that MMDAs' response to the various pieces of legislations seeking to deepen fiscal decentralization has been poor mobilization of IGF. They have resorted to heavy dependence on the DACF to implement their plans. Implementation of the mandate of the Assemblies requires adequate financial resources therefore under the fiscal decentralization policy, greater part of the resources of MMDAs to implement their plans is expected to be mobilized from internal sources in the form of IGF to finance and manage local development.

It is worth noting that revenue mobilization efforts by MMDAs are undermined by a number of factors including inadequate data on revenue sources, lack of enforcement of revenue collection bye laws, inadequate revenue collectors, and inadequately trained revenue collectors (Ayee 2008). Additionally, the lack of billing resulting from an outdated property valuation list and a lack of electronic databases of property owners show that MMDAs struggle to mobilize IGF. In most MMDAs in Ghana, only a small proportion of properties have been valued. Only a third of MMDAs in the country have employed the services of the Land Valuation Division to estimate the values of some properties to form the basis of property rate fixing. As a result, most MMDAs fixed property rates without proper valuation.

Other constraints to the mobilization of IGF by MMDAs include lack of human and financial resources, weak legal capacity and political interferences (Crook 2003). For many MMDAs, cash is still by far the most common payment method for property rates and business licenses. Yet cash payments allow unacceptably high rates of leakages leading to declining revenues which reduce funds available for MMDAs.

MMDAs also spend substantial proportions of their IGF to pay for the processes of revenue collection such as paying commissioned revenue collectors and contracted revenue collectors. Local governments have been experiencing budget deficits for years, and they consistently spend more than they are able to generate as revenue. The cost of collecting internally generated funds is very high in most MMDAs, particularly among salaried revenue collectors. For the median salaried revenue collectors, their monthly salary is about 60% as high as revenues collected. About one out of five revenue collectors earns a monthly salary that is greater than their revenues collected. There are reports of corruption and dishonesty among revenue collectors, which impedes effective IGF mobilization. Some collectors also complain of low remuneration, which affects their morale, and ultimately revenue collection efforts. Due to the many challenges of revenue collection, most MMDAs continue to depend heavily on central government transfers. There is also evidence that MMDAs are not exploring other sources of revenue, which makes them over-reliant on central government for support. The inability of MMDAs to raise local revenue is also influenced by weakened institutional structures, noncooperative local actors, declining local economies and leakages in the IGF mobilization process.

In the face of all these issues, the National Development Planning Commission (NDPC) has monitored and evaluated IGF mobilization performances of MMDAs across the country. In the 2013 Annual Progress Report on the Implementation of the Ghana Shared Growth and Development Agenda (GSGDA), 2010–2013, the NDPC identified the inability of many MMDAs to mobilize adequate IGF as a major factor that undermines Ghana's fiscal decentralization policy. The NDPC's evaluation suggests that MMDAs in the northern parts of Ghana are lagging behind those in the south. A number of reasons have been given to explain the disparities; these include low economic activities, low capacity of revenue collectors due to inadequate training, lack of accurate data on landed properties and billboards, and lack of structured monitoring of revenue collectors, leading to massive revenue leakages.

Without questioning the disparities, it must be stated that available evidence shows that most MMDAs have unimpressive IGF mobilization records. If the ultimate goal of Ghana's fiscal decentralization is to wean off MMDAs from central government funding, such poor performance can undermine the policy objective. To give Ghana's decentralization any hope will require that MMDAs demonstrate their ability to mobilize adequate IGF. One way to determine this will be a consistent increase in IGF, or at least MMDAs must meet their IGF targets. This contribution describes what prevails in five MMDAs in Ghana which are Awutu Senya East, Yilo Krobo, and Wassa Amenfi East as good performing cases among MMDAs in the southern zone of the country. Lawra and Saboba are described as not performing well in revenue mobilization in the northern zone of the country (see Republic of Ghana 2014). This is a comparative but noncompetitive presentation of five

cases. The case districts were purposively selected across the country for fair geographical spread (see Fig. 1). The objective is to describe the factors at play in revenue mobilization in these MMDAs and share lessons across good performing and nonperforming MMDAs.

**Mobilizing Internally Generated Funds by Local Governments in Ghana, Fig. 1** Selected MMDAs for IGF Research in National Context, 2018

M

Carved out of the former Awutu Senya District in 2012, the Awutu Senya East Municipality has Kasoa as its capital with an estimated population of 108,422. The municipality is located on the eastern boarder of the Central Region and bounded by Ga South Municipal, Awutu Senya District, and Gomoa East District. The Awutu Senya East Municipal Assembly has consistently exceeded the estimated amount of IGF after 2012 fiscal year. Regardless of the fact that the financial report presented by the Assembly on the proportion of IGF to the total revenue available to the Assembly over the period after 2012 fiscal year declined, the assembly still exceeds its expected IGF and presents a case that needs to be studied and lessons shared.

The Yilo Krobo Municipality is one of the 26 MMDAs in the Eastern Region of Ghana. The municipality covers an area of 805 $km^2$ and has a population of about 87,847. The municipality is bordered by Lower Manya Krobo Municipality and Upper Manya Krobo District, Akwapim North Municipality, Shai-Osudoku District, New Juaben, East Akim Municipalities, and Fanteakwa District. Over the years, the District Assembly is reported to have heavily relied on external funds.

Located almost at the geographic center of the Western Region of Ghana, the Wassa Amenfi East Municipality is bordered by Wassa Amenfi Central District, Prestea Huni Valley, Upper Denkyira East, and the Upper Denkyira West Assemblies. According to the 2010 Housing and Population Census, the Wassa Amenfi East Municipality had a population of 83,478 which is expected to increase to 97,962 in 2018. The municipality's overreliance on the DACF resulted in their inability to meet their annual revenue targets internally which consequently has informed the assembly's, medium-term development plan. With persisting deficits in the annual budget of the municipality, the District Medium Term-Development Plan covering the 2018–2021 already has a projected budget deficit of GH¢6,359,616.57.

The Lawra District Assembly is one of the 11 District Assemblies in the Upper West Region with Lawra as capital. The district lies in the North-Western corner of the Upper West Region in Ghana. It is bounded to the North by Nandom District, to the East by Lambussie-Karni District, to the South and West by the Republic of Burkina Faso. The total area of the District is put at 1,051.2 $km^2$ which is approximately 5.7% of the Region's total land area and has an approximate population of 54,889 people with a growth rate of 1.9%. Like all the other assemblies in the country, Lawra over the years has had to mobilize funds internally to supplement the DACF and other funding sources. However, the annual IGF targets of the Lawra District Assembly have never been met in any given fiscal year.

The Saboba District is one of the 26 districts in the Northern Region of Ghana. The district covers a land area of 1,751.2 $km^2$ and has a population of about 65,706. Saboba District is bounded by River Oti, Gushiegu, and Karaga districts to the West, the Tatali District to the East, Chereponi District to the North, Yendi to the South-West, and Zabzugu to the South. According to the district's District Medium-Term Development Plan, the Saboba district continues to depend heavily on the DACF due to the Assembly's inability mobilize annual estimated amounts of IGF.

The next section will describe the IGF mobilization performances across these MMDAS from 2013 to 2017. This will be followed by a discussion of the issues around IGF mobilization prevailing in these MMDAs.

### No Consistent Increase in IGF

In all the MMDAs, there has not been a steady rise in IGF mobilization. The analysis of actual revenue performance and percentage changes reveal that between 2013 and 2014, the Awutu Senya East Municipal Assembly only achieved 29.1%. This increased to 30.2% in 2014/2015 and reduced to −5.9% in 2015/2016 before rising again, to 53.8% in 2016/2017 (see Fig. 2 and Table 1). For the Yilo Krobo Municipal Assembly, it started with a −55% and increased to 10% in 2014/2015, a further increase to 17.8% in 2015/2016 but dropped to −42.1% in 2016/2017. Similarly, Wassa Amenfi East Municipal Assembly started with 108.1% but dropped to 52.3% (2014/2015), 23% (2015/2016), and −44.1% (2016/2017). The Lawra District Assembly

**Mobilizing Internally Generated Funds by Local Governments in Ghana, Fig. 2** Percentage change in revenue performance across cases from 2013 to 2017. (Source: Field Survey, June 2018)

achieved 138.7% (2013/2014) but dropped to 18.6% (2014/2015) and −27.2% (2015/2016) before increasing to 4.2% (2016/2017). The Saboba District Assembly achieved 212.3% (2014/2015) but dropped to 12% (2015/2016) and −42.4% (2016/2017) (Republic of Ghana 2014). These data show that many local governments in Ghana are unable to increase local revenue collection (Crook 2003; Awortwi 2010b).

From both Fig. 2 and Table 1, all the five MMDAs were characterized by dwindling and/or unstable IGF mobilization trends over the period between 2013 and 2017. Apart from Yilo Krobo and Awutu Senya East which made increased revenue between 2013 and 2014, all the other MMDAs dropped in their IGF figures. Even those two cases that showed promise in the first year reduced or dwindled in percentage increases in the second study year – a clear indication of an unstable and inconsistent IGF mobilization trends. The so-called poor-performing MMDAs also recorded rapidly decreasing revenue trends, with some marginal stability and/or increases. The several technical and operational factors responsible for the unstable IGF mobilization trends for the 5 MMDAs are discussed next.

## Discussions

What this entry intends to show is that in order for fiscal decentralization reforms to work for MMDAs to be weaned off central government funding, there must be clear signs of growth or consistent increase in terms of IGF mobilization. But as the data shows, IGF performance cannot be described as consistent. They all recorded some increases and some drops in revenues during the period. The study explored what could explain this phenomenon. Initial thinking was around institutional factors but this could not adequately account for the revenue performance.

**Mobilizing Internally Generated Funds by Local Governments in Ghana, Table 1** IGF mobilization performances across study cases from 2013 to 2017

| Cases | IGF situation (GH₵) | Years under review | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | 2013 | 2014 | % change 2013/2014 | 2015 | % change 2014/2015 | 2016 | % change 2015/2016 | 2017 | % change 2016/2017 |
| Awutu Senya East District Assembly | Actuals | 1,131,425.43 | 1,460,270.63 | 29.1 | 1,901,716.49 | 30.2 | 1,788,964.56 | −5.9 | 2,750,744.82 | 53.8 |
| Yilo Krobo Municipal Assembly | Actuals | 2,356,660.76 | 1,061,454.19 | −55 | 1,167,505.87 | 10 | 1,374,995.82 | 17.8 | 796,622.72 | −42.1 |

Source: Field Survey, June 2018

Existing institutional structures for IGF mobilization for all MMDAs are the same and perform the same functions in line with the local revenue mobilization mandate as specified by the Local Governance Act, 2016 (Act 936). Key departments responsible for revenue mobilization activities at the district level are the Municipal Finance Office, the Budget Unit and the Works Department. In all MMDAs, Finance Officers work closely with the Budget Analysts as part of the Central Administration. Revenue Superintendents monitor the activities of revenue collectors and report to Finance Officers. All these officials and departments are headed by Metropolitan, Municipal, or District Coordinating Directors who supervise all IGF mobilization and other administrative activities in the Assemblies. The reasons why the Assemblies are unable to achieve consistent rise in revenue mobilization or at least not drop from previous years include the quality of revenue collectors, outsourcing of some of the revenue items, logistics for revenue collection, and payment arrangements for revenue collectors.

### Quality of Revenue Collectors

High quality human resource matters in the ability of MMDAs to increase IGF mobilization. For some of the Assemblies, high performance was recorded in periods in which they embarked upon training of revenue collectors. Some MMDAs, for example, trained revenue collectors on current trends, skills, and laws such as the Financial Management Act, 2016 (Act 921). In the Saboba District, which has been described as one of the poorly performing districts, revenue collectors were never trained to do their work. As a result, both commissioned and permanent revenue collectors are left to use their own discretion in doing their work. This situation largely explains the fluctuations in the IGF performance of the Saboba District Assembly. The receipt books and financial reports also indicated some of these challenges at the revenue section of the Assembly. This supports the claim that high quality human resource is key to the success of any organization including revenue collectors at the MMDAs. For the training to be effective, it has to be continuous and for all categories of staff of the organization. For those Assemblies that organized training, the problem, however, was that the training was not continuous and not all categories of revenue collectors were trained. Low-performing MMDAs did not sustain the training of revenue collectors in basic book keeping, accounting, and ethical approach to revenue collection, although these are essential.

### Outsourcing Selected Revenue Items to Private Commissioned Revenue Collectors

According to Ghana's Public Financial Management Act, 2016 (Act 921), MMDAs could outsource the collection of local revenue to private individuals or firms (Republic of Ghana 2016b). Outsourcing of selected revenue items to private firms was helpful in some of the Assemblies such as the Awutu Senya East Municipal Assembly. In this arrangement, having obtained the data on revenue yields from the selected revenue items, the Assembly engaged private firms to collect local revenue for the selected revenue items and locations with their own staff and logistics at no cost to the Municipal Assembly. The assembly then pays the firms a commission of 30% of the total revenue collected. This arrangement enables the Municipal Assembly to reduce the cost of local revenue collection and to free available limited resources for mechanized revenue collectors which enhances collection efficiency. A similar arrangement exists at the Lawra District but this failed to work well due to the nature of the arrangement made between the Assembly and the private firm. In the case of the Lawra Municipal Assembly, the revenue collection contract was awarded to the private firm without accurate information about the potential revenues expected. Hence, without knowing the potential revenue yields, the Assembly engaged a private firm to collect all revenue items as opposed to the practice of the others MMDAs where specific items and specific locations are outsourced to private revenue collectors. What this implies is that although outsourcing can be an effective tool, it has to be strategically designed and implemented.

### Logistics for Revenue Collectors

The availability of adequate logistics is essential for human resources to perform effectively. Those

Assemblies that provided logistics support in the form of travel and transport to revenue collectors were able to increase revenue levels. For example, in the Yilo Krobo and Wassa Amenfi East Municipal Assemblies, the periods in which they paid transport and travel allowances to revenue collectors to enable them travel to all areas in the municipality to collect revenue items assigned them were periods in which they did well (See Fig. 2). In addition to the transport allowance, the provision of other logistics such as raincoats, wellington boots, and umbrella to revenue collectors helped to increase revenue collection. The MMDA that did not give bicycles, raincoats and boots, transportation allowance or any other support made it difficult for revenue collectors to work well. In spite of these issues, however, there were instances that revenue collectors still collected revenues without these listed logistics but did not account to the Assembly. Although it is not clear whether the non-provision of logistics really meant that revenue collectors did not go round to collect these revenues, logistics constitutes a critical component of revenue collection process.

### On-the-Spot Payment of Revenue Collectors

On-the-spot payment of revenue collectors is one of the strategies that motivate revenue collectors and helped in some of the Assemblies. In the Yilo Krobo Municipal Assembly, in order to reduce the stress revenue collectors go through to receive their 20% commission, they were paid their commission "on the spot" when they account for the total revenues they collected. This arrangement, however, contradicts the Public Financial Management Act, 2016 (Act 921), which states that commission revenue collectors are to deposit the money at the bank and their commission is paid through a cheque to be written for them to be cashed at the bank. In spite of this, the "on-the-spot" payment arrangements minimize corrupt practices among revenue collectors and motivate revenue collectors to perform well. When this changed, revenue levels dropped supporting the argument that well-motivated staff is important for organizational performance. For example, when a commission revenue collector comes to account for and deposits receipts of market tolls collected amounting to 200 Ghana Cedis and all the necessary crosschecks are done, this commission collector is required to walk to the bank to deposit the 200 Ghana Cedis at the bank for a receipt. She/he would then bring the receipt back to the Assembly for a cheque of 40 Ghana Cedis (20% commission) to be taken back to the bank to cash the cheque. This process discourages revenue collectors from frequently coming to the Assembly to account for the revenues they have collected. They will rather prefer to keep the money with them until when they think they have enough money to deposit. At this point, they think the process involved in getting their commission will be worth their while. But many of them end up using some of the money they keep and find it difficult to account to the Assembly. This is one of the major causes of revenue leakage in these MMDAs.

The instant payment of the commission revenue collectors was to encourage the collectors to be honest and declare all revenues collected. The argument for on-the-spot payment of revenue collectors as important motivation seems strong because corruption among revenue collectors explain consistently low performance in those Districts where this arrangement was not in place.

## Conclusions

This entry set out to describe the consistency in IGF mobilization by local government bodies. The argument is that for fiscal decentralization to be deepened making it possible for central government to wean off MMDAs, MMDAs must show consistent increase in IGF performance or at least maintain targets rather than dropping. The evidence shows that MMDAs cannot boast of sustained IGF mobilization and it looks quite impossible that mobilizing adequate IGF can be possible. If this continues, it is most likely that the ultimate aim of getting the MMDAs to stand on their feet and wean themselves off central government funding cannot be achieved anytime soon. For this to be possible, the strategies such as training of revenue collectors, outsourcing the

collection of selected revenue items, the provision of logistics, and on-the-spot payment to commission collectors appear to be helpful.

## Quality of Revenue Collectors: Intensify Training of Revenue Collectors

The training of revenue collectors should be adopted by MMDAs that are not doing this. Those MMDAs that train their collectors need to sustain this. The training of revenue collectors can be restructured such that it is organized at the end of every quarter so that lessons are fed into next phase of collection cycle. MMDAs can arrange for their revenue collectors to attend short courses in techniques of revenue mobilization, record keeping, accounting, and revenue reporting.

## Outsourcing the Collection of Selected Revenue Items to Private Commission Collectors

The Assemblies must conduct a study on which of the revenue items or revenue sources and their locations will be appropriate for outsourcing to private commission collectors. Such a study should produce information on what these items can yield and therefore what the Assemblies must expect from the private collector. The contract must be strategically designed such that it is cost-effective to the Assembly.

## Logistics for Revenue Collection

District Assemblies must provide bicycles, motor bicycles, and pickup vehicles for revenue collection purposes. The bicycles and motor bicycles may be particularly helpful as their maintenance cost will be comparatively cheaper than the pickup vehicles helping to reduce revenue collection costs. Personal protective equipment such as wellington boots, raincoats, and custom designed vests need to be provided to revenue collectors. MMDAs must consider collaborating with the local community police to support them to discourage the harassment of revenue collectors.

## Remuneration and Motivation Arrangements for Revenue Collectors

On-the-spot payment of commission revenue collectors might help encourage revenue collectors to promptly account for what they collect. The Assemblies may also consider engaging more permanent revenue collectors whose job security will be tied to performance agreements such that they work to meet set revenue targets weekly. In addition, they might consider instituting incentives such as public recognition at durbars, publication of weekly revenues with names of revenue collectors in town halls, market places, and other public places to motivate others to emulate. Where bicycles and motor bicycles are not provided, the Assemblies must pay transport and travel allowances to revenue collectors for them to be able to reach all areas in the district to collect revenue items assigned them.

## MMDAs Must Invest in Business Ventures

MMDAs might think about investing in business ventures to enable them generate their own revenues. Assemblies such as the Yilo Krobo Municipal have taken the lead in investments by taking advantage of the natural resource potentials of their area to cultivate mangoes. The Lawra and Saboba Districts can take advantage of the large deposits of shea trees available in the district to set up sheanuts processing plant. Such a plant can be used for processing the nuts at a fee. This investment could be additional revenue item that would generate substantial amounts of revenue for the Districts.

# Models of Organizational Change

Katharine Leigh
Ball State University, Muncie, IN, USA

## Synonyms

Development; Innovation; Reorganization; Restructuring; Transformation; Transition; Turnaround

## Definition

**Organizational change** is when an organization goes through a transformation in regard to its structure, strategies, methods, technologies, or organizational culture. The change can be prolonged or for a set period of time.

## Introduction

Organizations have been engaging in change for decades. Change can be intentional, in order to move the organization forward with its goals. It can also be unintentional, when other forces cause change. Researchers have been studying change by viewing it through organizational change models. Organizational change models can reveal why change occurs (the driving forces of change), how change will occur (the stages, scale, timing, and process characteristics), and what changes will occur (the content of change, outcomes, and ways to measure it) (Kezar 2001). Models can also reveal an organization's ideology and its values. There are many models an organization can choose from, which can be sorted into six categories: life cycle, evolutionary, dialectical, teleological, social cognition, and cultural. The two main models are teleological (scientific management) or evolutionary (adaptive change).

Teleological models revolve around planned change. Planned change happens intentionally,

usually because a leader wants to implement change. The focus in this model is on individuals with power. Leaders create change by planning, analyzing, and assessing the changes. Scientific management and total quality management (TQM) are examples of teleological models. The benefits of teleological models include the identification of leadership in the change process, the importance of collaboration, and staff development. The drawbacks of teleological models are that they lack recognition that organizational culture can impact change and that not all change can be planned.

Evolutionary models believe that change is always happening and that variables are constantly transforming both people and organizations. The two main types of evolutionary models are social evolutionary and biological. Contingency theory and strategic choice theory are examples of evolutionary models. The main premise underlying all these theories is that change is dependent on circumstances, situational variables, and the environment faced by each organization (Kezar 2001). These models view change as natural, with organizations managing change by reacting to it rather than planning for it. Some later evolutionary models acknowledge that managers can be proactive by anticipating changes in their environments. Systems and interactivity are important in evolutionary models. Organizational systems are viewed as connected and interdependent.

Evolutionary models are different than teleological models in that organizations are considered to be part of an open system, versus a closed system. Managers need to anticipate, analyze, and react to change, as opposed to planning on and implementing change. Some criticisms of evolutionary models are they are overly reliant on environmental factors in describing change, that they de-emphasize strategic choices, and that they stifle creativity.

## Examples of Organizational Models

**Scientific management** is a teleological model and is one of the older models of organizational change. Frederick Taylor began its development in the United States during the 1880s and 1890s (hence why scientific management is sometimes referred to as Taylorism). During this time there was a switch in the production methods of manufacturing, from humans making all of the products to machines replacing humans on assembly lines. Taylor espoused four principles in his book *The Principles of Scientific Management* (1911).

Principle 1: Use the scientific method to study the work being performed, and determine the most efficient way to perform the specific tasks.

Principle 2: Match workers to their jobs based on motivation and capability, and then train them to do the job at maximum efficiency.

Principle 3: Monitor performance and provide instruction and supervision to continue efficiently working.

Principle 4: Allocate the work between managers and workers so that the managers spend time planning and training so workers can focus on their own tasks to achieve the highest efficiency.

There are several criticisms of scientific management. Scientific management involves a large amount of managerial control over workers. This level of control requires a significant number of managers, who tend to be expensive. Another criticism is that an organization cannot adapt to change if a rigid system is imposed on them. Additionally, the model may not value workers' satisfaction. Scientific management's principles can still be seen in today's workforce, such as with systematic selection and training procedures, with the studying of workplace efficiency, and with the idea of systematic organizational design.

**Total quality management (TQM)** is a teleological model that focuses on organizational efforts to create a permanent climate in which organizations continuously improve, delivering high-quality products and/or services to their customers. TQM has its roots in the competition for economic superiority during the 1970s and

1980s between western countries and Japan. Japan was increasing production on high-quality items, such as automobiles and electronics, at competitive costs. The Japanese were able to increase production because of the importance they placed on being processed oriented: their work processes were defined, understood, and in control (Damon 1992). Countries in Europe and the United States were looking for a way to respond to the Japanese methods by focusing on quality control.

TQM urges organizations to use the skills of all of their employees, to eliminate waste, to maximize efficiency, and to refine imperfect processes. Some important TQM concepts are quality is defined by the customer, top management has direct responsibility for quality improvement, increased quality comes from systematic analysis and improvement in work processes, and quality improvement requires persistent effort throughout the whole organization. All of an organization's efforts are part of a system; one cannot change one part of the system without affecting the other parts (Schultz and Vollum 1992). A variation on TQM used in the public sector is New Public Management (NPM).

**Contingency theory** is one of the evolutionary models of organizational theory. Contingency theory argues that there is no single, perfect way to manage an organization. Organizational effectiveness results from matching characteristics of the organizations, such as its structure, to contingencies that mirror the situation of the organization (Donaldson 2001). Contingencies involve both internal and external factors. Some contingencies an organization might encounter are the environment, organizational size, organizational strategy, technology, supplier and distributors, consumer interest groups, governments, and unions. The goal of the organization is to broker the best match between organizational characteristics and contingencies encountered, in hopes of increasing the organizations' overall performance. Organizations must adapt to avoid mismatches between characteristics and contingencies. Change is inevitable, and organizations that do not change (for whatever reason) will see their productivity wane. Since no one type of organization is considered "best" to match all contingencies, different types of organizations are needed, depending on the environment.

Leaders in the contingency theory model will need to apply their personal style of leadership to each situation. Careful management is needed to balance internal needs and also to adapt to environmental circumstances. An effective leader will excel at building interpersonal relationships with their employees, showing support for their careers and concern for their well-being. They will also need to provide structure, via planning and scheduling, to ensure that work is completed and that organizational goals are attained.

**Strategic choice theory** is an evolutionary model that posits that an organization's internal and/or external environment does not completely shape their strategic actions (Tokman et al. 2016). Previous models said that organizations developed along operations requirements based on the external environment. Strategic choice theory believes that while some organizations adapt to their internal and/or external environments by changing themselves, other organizations chose to change their environment instead. These changes can be accomplished by creating strategic goals, which drive adaptation behavior in organizations. An example of adaptation behavior is when an organization chooses to cooperate with another organization because both parties have resources that complement each other. There are three key issues that come from strategic choice analysis: the role of agency and choice, the nature of environment, and the nature of relationships between organizational agents and the environment (Child 1997).

Leaders in strategic choice theory have the power to influence their organization to suit their preferences, regardless of the type of the organization (public or private sector). The environment of the organization does have an impact on leaders, but leaders can choose how to proceed by creating strategic goals. Leaders are very active, and their influence on the organization comes through a political process (Child 1997). Leaders need to be aware of how organizational politics will affect their plans.

## Organizational Change in the Public Sector

Organizations in the public sector also engage in change management for several reasons. First, public sector organizations have customers that they must be accountable to, just like in private organization. There can also be a competition for customers between the public and private sector. Second, if a public organization is not considered to be performing well, their funding could be eliminated. Not only are public organizations in competition with the private sector but also with other public sector organizations vying for monies from the same budget. In order to improve customer service, an organization would want change models that focus on improving processes and removing obstacles that prevent the achievement of its goals (Stewart and Kringas 2003). Differences between the public and private sector impact how change management is handled by the two spheres. For example, political pressure can be more easily exerted on public institutions. Political pressure can vary among countries based on their systems and cultures and also vary from the local level to the national level.

A study in the 1990s examined the restructuring process of a large public housing agency located in an unnamed city in the western part of Austria (Scharitzer and Korunka 2000). The goal of the study was to see the effects of recently implement changes on both the employees of the public housing agency and their customers. Data was collected through qualitative and quantitative instruments, including through face-to-face interviews with employees at all levels in the organization and customer surveys taken at three different points in the change process. The change model used was New Public Management (NPM). NPM is a management system that emphasizes the concept that ideas used in the private sector must be successful in the public sector and has a focus on customer satisfaction. The study showed that the agency's employees experienced job-related stress due to the changes and that the decrease in job satisfaction affected the various levels of employees (such as management or their staff) in different ways. Overall the change was considered a success because customers approved of the more customer-oriented agency.

Researchers performed another change management study in the 1990s, this time in Australia (Stewart and Kringas, Stewart and Kringas 2003). The study reviewed six agencies going through change management. The focus was to ascertain whether the change was considered a success, both by the employees in the agency and by the customers they serve. The size of the changes varied, depending on which of the six agencies were being studied. The researchers found that there were several factors that led to successful outcomes and changes. The factors were an appropriate change model, effective leadership, sufficient resources, and attention to communication. Effective communication was considered to be particularly important. The researchers felt that the administration had a more positive view of the change than their employees. Senior managers were often unwilling or unable to explain their processes to their employees and why they were doing them; instead, they blamed employee resistance for failures in implementation (Stewart and Kringas, Stewart and Kringas 2003). The researchers believe that good communication and a carefully conceptualized strategic plan will increase the likelihood of successful change.

The Chinese government has tried multiple times to change their public administration since 1949. They hoped to achieve greater social and political stability (internally) and to adopt to globalization (externally) (Wang 2010). A well-run government can contribute to stability by helping provide more services, which in turn will help businesses. The reforms implemented by the Chinese government focused on reducing the staff and size of the government, including streamlining departments and services. This had a negative effect on social stability since many citizens lost their jobs and had difficulties securing alternative employment. Criticisms of the reform efforts focused on three factors: too much attention was paid to restructuring, the reforms were initiated and implemented in a top-down manner, and there was a lack of a sound legal

basis for the reforms. The Chinese government often reverted to earlier practices after the completion of specific reforms, including hiring new people to replace those that were removed earlier. Organizational change is especially difficult in China, which is the most populous country in the world, and its politics have an enormous impact on any planning process.

## Conclusion

Organizations, whether they are in the public sector or the private sector, have many change management models to choose from. Organizations could choose a model that focuses on changes they want to see made, or they could choose a model that focuses on the environment in which the organization operates, or they could chose choose a hybrid of these approaches. Philosophically, organizations must decide whether to be proactive or reactive. The former sounds better, but perhaps assumes a level of knowledge, skill, and control that not all organizations possess. Communication is very important, with all of the stakeholders needing to know both what change is going to happen and why that change is going to happen. Political pressures, both inside and outside the organization, also have a significant impact. There may ultimately be no "best" model to choose and no "ideal" way to implement it. Still, organizations must engage in change management, and they are more likely to make good decisions if they search for change models that fit best with their goals.

## Synonyms

Administrative political system; Departmental organization

## Definition

The term bureaucracy refers to the Weberian concept although bureaucracy existed well before Weber (Höpfl 2006). Specifically, Weber's bureaucratic ideal type refers to an administrative governing system in which:

– Domination is based on rationality, i.e., on knowledge and science.

- Domination is a set of abstract and coherent rules (e.g., standards).
- Decision-making is entrusted to the most qualified people.
- Order is insured through the control of subordinates within a hierarchical organization.
- Domination is exercised in the context of work only and subordinates obey rules not individuals.

## Introduction

This article entitled "Bureaucracy, Modernity" is about the emergence of bureaucracy *in* modernity and its transformations in late modernity, and it is centered on the following questions: are the organizational transformations of the last few decades a sign that bureaucracy is declining or gaining momentum? Is a *post*-bureaucratic model emerging? This article concludes that bureaucracy is not declining. Instead, this article proposes that bureaucracy be viewed as a form of administrative power – an institutional dimension of modernity (Giddens 1984) – that is dynamic and that its production and reproduction be understood through a study of its structuration, in the hope of relativizing the "bureaucracy vs. post-bureaucracy" debate.

## The Emergence of Bureaucracy in Modernity and Its Evolution in Late Modernity: A Structurationist Perspective

### From Tradition to Modernity or the Rebuilding of Trust

For Giddens (1990), modernity began with a break with tradition and, more particularly, the rejection of destiny and religious cosmology: ". . .a world structured mainly by humanly created risks has little place for divine influences, or indeed for the magical propitiation of cosmic forces or spirits" (Giddens 1990, p. 111). Modernity has thus given agents the sense that the future has become open.

Moreover, modernity is characterized by the "separation of time and space" and the "disembedding of social systems," two conditions of modernity that in turn have led to the metamorphosis of reflexivity. Reflexivity, the third condition of modernity, refers to a body of knowledge that helps provide direction for the future and organize social relations. It is a concept that implies that integration practices henceforth will be reexamined continuously and reformed in light of new knowledge about them that constitutively alters their character.

In modern social systems, the aim of integration practices is to connect "absence and presence" as relations become increasingly suppressed in conditions of copresence. Some phenomena emerge in this context: the "other" becomes invisible and his process impenetrable, because activities depend on connections outside conditions of copresence; social trust therefore becomes difficult, if not impossible, to achieve. However, because trust is the innate vector of ontological security, the increased suppression of relations of copresence spurs efforts to rebuild trust, which in the circumstances implies to create *systemic trust*. Systemic trust is based on abstract systems (symbolic tokens and expert systems) and results in a displacement of trust (from people to abstract systems).

In this sense, organizations, a fundamental characteristic of modernity (Weber 1991; Perrow 1991), become social systems that make up, and are made up of, integration practices (social and system) that enable time-space coordination as part of the trust-building effort. Social integration practices refer to "reciprocity between actors in circumstances of co-presence, while system integration practices allow for reciprocity between actors across extended time-space, outside conditions of co-presence" (Giddens 1984). For example, a budget can be conceptualized as a systemic integration practice. It is the monetary expression of the organization's strategic directions but also a tool that helps coordinate the activities of several actors and allows control of expected results. As a result, a budget is a management practice through which reciprocal relations can be

established. Defined as an integration practice, a budget creates trust in organizations.

Thus, because modernity makes it possible to establish particular forms of organization of human activity, it generates and integrates institutional dimensions, i.e., capitalism, industrialism, administrative power, and control of the means of violence.

Modernity can therefore be described as a loop consisting of the elements "Separation of time and space – Disembedding of social relations – Reflexivity – Integration practices – Trust – Institutionalization of the dimensions of modernity" (Fig. 1). Its circular nature illustrates reflexivity and highlights the fact that integration practices can always be revised.

## From Modernity to Late Modernity or the Rise of Surveillance

Late modernity (from the mid-twentieth century onward) is characterized by increased production of knowledge, and it is spawning the radicalization of modern social organization practices, a state that Giddens (1990) attributes to: (1) the reflexivity and competence of agents, (2) the impossibility of obtaining systematic knowledge about social organizations, (3) the organizational strength of abstract systems and the autonomy this strength confers, (4) the globalization of risks and threats in societies, and (5) the "major problem" of societies – overall control instead of risk management.

By implication, as the body of knowledge *grows* and systemic trust *extends* in late modernity, integration practices *increase* the separation of time and space, *strengthen* institutions of modernity, and *extend* absence. But, because integration practices are a component of power relationships, systemic integration practices do not provide mutual trust experiences (Giddens 1990). In the budget example, trust is not necessarily shared if, for instance, senior managers are the only stakeholders able to monitor the budget. Thus, systemic trust gives rise to and intensifies surveillance (Dandeker 1990; Fig. 2).

An important point is that Giddens (1984) does not view surveillance, power (transformational capacity of power), and domination (relational dimension of power) as intrinsically unhealthy or dangerous. Surveillance characterizes all social relations, particularly relations in organizations (Jenkins 1993). It evinces coordination problems, to be sure (Giddens 1993), but can be conceived as a manifestation of the efforts expended to coordinate human activities in organizations. Surveillance therefore provides opportunities for collective action in the organization, but is a source of conflict if its asymmetry supports non-

**Modernity and Bureaucracy, Fig. 1** Course of modernity

**Modernity and Bureaucracy, Fig. 2** Course of late modernity

legitimate power or domination of an actor or group of actors over others (Tixier 1988; Giddens 1993).

## Bureaucracy in Late Modernity: A Dynamic Administrative Power to Explore

### Bureaucracy: A Form of Administrative Power

Within the framework of the institutionalized dimensions of modernity, the previous diagram (Fig. 2) suggests that administrative power supports knowledge and the structuration of integration practices and is supported by these factors in turn.

Thus, bureaucracy, a type of administrative power (Giddens 1984), (1) develops with the accumulation of knowledge and social activity, (2) relies on and supports the conditions of modernity, and (3) has the means of stabilizing trust in time-space in a context characterized by the disembedding of social relations. Bureaucracy is therefore both the process and outcome of integration practices (e.g., rules and hierarchical organization) that have sustained and constrained its constitution in an effort to rebuild trust:

> [Translation] To the somewhat "blind" trust [social trust] of a "community," "society" can add or substitute another type of trust that can be called a "rational" or "legal" trust, consonant with Weber's legal domination typology. "Rational" trust, constitutive of "society," ensures the existence of a framework within which can be expressed most social relations typical of a partnership. (Lazuech 2002, p. 16)

Bureaucracy therefore originates from a project of economic and social *order* founded on domination (Weber 1971; Chandler 1977; Wren 1994), but because order is more of a pattern in social systems (Giddens 1993) than a formal organizational method, bureaucracy is reproduced and transformed according to changes in human activity and the intended or unintended consequences of activities in modernity and late modernity.

Thus the content of bureaucracy hinges on its ability to ensure integration and sustain trust, and it is specifically this ability – or lack of it – that explains its reproduction and transmutation. From this perspective, so-called "post-bureaucratic" models are no more than an evolutionary form of bureaucracy. Successive management practices are therefore conceived as "theories in use" ("discursively formulated beliefs. . .that actors hold", Giddens 1984) that define the various historical periods of bureaucracy.

The expression "management practices" denotes organizational forms (hierarchical, project based, network, etc.) as well as management

tools (rules, project management technology, contingent work, outsourcing, reengineering, ERP, etc.). Management practices that endure in time and space become the keys to the reproduction of bureaucracy; conversely, when they evolve in time and space, they are viewed as key to the transmutation of bureaucracy.

In this view, whether bureaucracy is at the origin of instrumental relations matters little. Bureaucracy both constitutes and is constituted by structural properties, integration practices, and social relations. It relies on structural traits (the capitalist work contract, most prominently) and refers to other social systems (legal or scientific frameworks). Hence, bureaucracy cannot be reduced to a list of components, a problematic identification exercise most notably because when Weber's descriptions are compared, "[T]here are substantial discrepancies and variations between the different accounts, even regarding what is 'essential', or definitive of the ideal typical bureaucracy" (Höpfl 2006, p. 11).

### Bureaucracy: A Dynamic Administrative Power

Based on the preceding information, bureaucracy enables (Giddens 1990) and is enabled by the rise of the society of organizations (Weber 1991; Perrow 1991) as a component of the trust-rebuilding effort. Bureaucracy as an administrative power is a system of domination based on "the control of information as well as the implementation of specific modes of organizing human activity in space-time control" (Giddens 1984). (According to Giddens, the theme of the transformation of time and space exists in Weber's works but only implicitly.)

At a microlevel, bureaucracy can be understood as a "political dynamic," "[Translation] a project that those in power must constantly work at, solidify and justify" (Courpasson 2000). It is at once a source of power and of power struggles because managers in late modernity are not alone in their quest for control (Child 2005), any governed individual can view himself as a competent actor, there is a strong observed tendency to organizational fragmentation (Reed 1989), and legitimacies with federating claims are proliferating. Bureaucracy in late modernity must therefore be analyzed as a *dynamic* administrative power in light of a theory that lets us understand its constitution.

In short, it cannot be concluded that bureaucracy is declining or that a post-bureaucratic organizational model is emerging. Rather, it is argued that the perspective from which bureaucracy and its transformations are analyzed needs new explanations.

## Conclusion

Bureaucracy is usually defined by its content (hierarchical organization, rules, etc.), an exercise that invokes more difficulties than it solves. Furthermore, orthodox researchers exclude political issues or dynamic properties from their analysis of organizational forms. This is particularly the case with Mintzberg (1982) and Heckscher and Donnellon (1994). Thus, analyses based on an uncertain ideal type (Höpfl 2006), coupled with a tendency to dichotomize (mechanic vs. organic, centralization vs. decentralization, Alvesson and Thompson 2005) in allegedly apolitical contexts (Courpasson 2000), do not lead to comprehension of the meaning and impact of bureaucracy and its transformations.

Critical interpretive researchers are ambivalent about the evolution of bureaucracy and/or the post-bureaucracy phenomenon. A good number of empirical studies (see Alvesson and Thompson 2005 for survey) indeed demonstrate that hierarchical structures are more or less "loose," while control is more or less technical or social, information technologies are more or less present, rules are more or less internalized, social relations are more or less direct, etc. Bureaucracy then becomes "soft" (Courpasson 2000), "lite" a "legacy", migratory and even ghostly ("the return of the machine bureaucracy"), making it difficult to attribute meaning to the evolution of organizational forms and practices.

Nevertheless, Alvesson and Thompson (2005) assert that bureaucracy still exists ("bureaucratic

forms [are not] confined to a few residual institutional niches such as the public sector"; ". . .falls in the size of individual units and decentering organizations may change the forms of bureaucracy but they do not necessarily diminish its impact;" "[bureaucracy] is a living, changing, and diverse set of practices") and, in particular, that one must refine the analysis of organizational transformations and practices in order to assess their impacts:

> To really understand the presence and significance of bureaucracy requires in-depth exploration of organizational practices in different sectors and sections of organizations, thus escaping traditional analytical dichotomies such as mechanistic-organic and centralization-decentralization. Forms of control and coordination do not only interact, overlap with, or weaken one another; managers may comply with, reinforce, or circumscribe bureaucracy. [. . .] Caution is therefore required before ticking off bureaucratic or post-bureaucratic control forms without checking their meaning and impact carefully and in practice. (p. 501)

The analysis of bureaucracy poses a greater challenge than that of organizational transformation issues or the bureaucracy versus post-bureaucracy debate. From the structurationist perspective, any given circumstance presents constraints and opportunities alike, and bureaucracy is no exception.

Defining and analyzing the *organization* is the challenge to be tackled, and it lies on the recognition that an organization, whether private, public, or of the social economy, is first and foremost a *social system* that makes up, and is made up of, integration practices (social and system) that enable time-space coordination as part of the trust-building effort that can give rise to and intensify surveillance and support non-legitimate power or domination of an actor or group of actors over others (Briand and Bellemare 2006).

## Introduction

Money laundering has long been used by organized criminal groups and terrorist organizations, whose financial benefits have remarkably increased as a result of engaging in lucrative businesses such as drugs, arms, and humans trafficking to conceal the origin of their illicit funds (Lilley 2006). While money laundering may be traced back to the emergence of money itself, money laundering for terrorist purposes is not an old phenomenon (Laciner 2008). It has emerged by the rapid process of globalization, globalized nature of the terror threat, and increasing need for the legal instruments for financial activities both domestically and globally (United Nations/Commonwealth Secretariat/International Monetary Fund 2009). A great deal of globalization process has taken place only after the second half of the twentieth century thanks to developments in technology and communication. Terrorist organizations and organized criminal groups alike have also gone global as a result of the rapid globalization for the last decades. Now, criminal groups and terrorist organizations can more easily use diverse countries for recruiting, collecting funds, organizing, propagating, and taking shelter. One of the main concerns of these organizations is to finance their activities (Schott 2006). Although they can find little difficulty in getting money and funds for their operations, they have more difficulty in using the money for their acts since state-level, regional, and global instruments for countering the financing of terrorism have enhanced considerably as a result of tough measures set forth in multilateral agreements among states and international institutions. These measures have promptly necessitated terrorist organizations to use money laundering techniques for their financing (Lilley 2006).

The fact that the financial markets have also been globalized has created new opportunities for both legitimate businesses and illegal organizations. Like everybody else, organized crime and terrorist groups, too, who wish to do business globally, have the opportunity to use open financial systems for rapid mobility of funds. Criminals thus take advantage of this mobility in order to launder the proceeds of their illegal acts and conceal their illegal wealth (Lilley 2006).

There are numerous terrorist organizations that use sophisticated methods to move their illicit funds through financial systems both at home and across the globe. The Kurdistan Workers' Party (Kurdish: Partiya Karkerên Kurdistanê, PKK), an ethno-nationalist terrorist organization rooted in Turkey but operating in various countries including Turkey's neighbors such as Iran, Syria, and Iraq, as well as in Europe, has benefited from similar kinds of terrorism financing activities for a long time (Marcus 2007). To finance its activities, it has engaged in terrorist financing methods and laundered its illicitly gained funds by cash couriers or front companies through which it collects money under the name of donation or aid particularly in Europe where its financial infrastructure heavily relies upon (Roth and Sever 2007). The PKK has long been known to have engaged in various methods to find funding for its activities. While the main concern is not money itself for the group, financial activities have forced the PKK to find ways to maintain relationship with drug and weapons dealers as well as human traffickers from whom it takes commission charges. The financing activities of the PKK particularly in Europe make it necessary for the group to deal with financial management including setting up front organizations for money laundering. Using various kinds of NGOs and media organizations has allowed the PKK to engage in money laundering activities (Marcus 2007). However, since the organization prefers not to use open financial institutions to move the funds, and its illegal money usually comes in the form of cash, it is becoming harder for law enforcement agencies to track money laundering activities of the group.

## Money Laundering and Terrorism Financing

The term "money laundering" may be traced back to the 1920s when mafia groups in the United States showed an active interest in acquiring launderettes to launder the money derived from criminal activities and inject it into the legal instruments (United Nations/Commonwealth Secretariat/International Monetary Fund 2009). According to a report of the World Bank and IMF on Combating Money Laundering and the Financing of Terrorism, money laundering is the process by which proceeds from a criminal activity are disguised to conceal their illicit origins. In the same report, the financing of terrorism is defined as the financial support of terrorism or of those who plan, encourage, or take part in terrorist acts (World Bank and IMF 2009).

Money laundering is used for financing the activities of a criminal organization in a way that the organization can conceal the origin of the money in order to be immune from law enforcement control. Money laundering has also been used by terrorist organizations for a long time for financing their activities (Lilley 2006). In this regard, financing of terrorism and money laundering are interrelated. Both have similar objectives and characteristics as well as some differences. While money laundering includes laundering illicit funds in legal channels in order to conceal the origins of the funds, terrorist financing includes both legally and illegally acquired funds for the support of terrorism. In short, while terrorism financing is aimed at providing funds to final destination, money laundering deals with legitimization (Sollier 2007).

Profits made by organized crime and terrorist organizations need to be laundered to be used in the future. While terrorist organizations engage in money laundering for terrorism financing, for most of them money not the primary goal since money is only used as a means leading to their ends. However, for law enforcement units, tracking money is of great importance. One of the axioms of many analysts in the security agencies is "follow the money" meaning criminals, and their networks can be more easily traced, uncovered, and disrupted. On the other hand, once the methods of terrorism financing are identified and traced by law enforcement agencies, it is more likely for terrorist organizations to go into bankruptcy and degenerate, which will consequently bring an end to most of their activities (Lilley 2006).

## Offenses and Methods of Money Laundering

The major aim of money laundering is to inject the dirty money into the legal economy (Sollier 2007). While there are different kinds of methods of terrorist financing and money laundering, there are four general kinds of offenses related to money laundering set forth by the United Nations Convention against Transnational Organized Crime (the Palermo Convention), which contains a broad range of provisions to fight international organized crime (United Nations/Commonwealth Secretariat/International Monetary Fund 2009):

1. *Conversion or transfer of proceeds of crime*: In this method, criminals try to convert financial assets from one type to another. For instance, illegally acquired cash money is used to purchase real estate, to sell criminally derived real estate, or to buy precious metals.
2. *Concealment or disguise of proceeds of crime*: This offense takes place where criminals intentionally conceal or disguise the proceeds of crime. This includes intentional deception of law enforcement units.
3. *Acquisition, possession or use of proceeds*: In this section, in addition to those who provide illegal proceeds, recipients who acquire, possess, or use property have also responsibility.
4. *Participation in, association with or conspiracy to commit, attempts to commit and aiding, abetting, facilitating, and counseling*.

As to the offenses related to money laundering and terrorism financing, the Financial Action Task Force (FATF) designated categories of offenses as such (FATF 40 Recommendations 2003):

- Joining an organized criminal group and racketeering.
- Terrorism and terrorist financing.
- Humans trafficking and migrant smuggling.
- Sexual exploitation, including sexual exploitation of children.
- Illicit drugs trafficking and trafficking in psychotropic substances.
- Illegal arms trafficking.
- Illicit trafficking in stolen and other goods.
- Corruption including bribery.
- Fraud.
- Counterfeiting currency.
- Counterfeiting and piracy of products.
- Environmental crime.
- Murder, grievous bodily injury.
- Kidnapping, hostage-taking.
- Robbery, theft.
- Smuggling.
- Extortion.
- Forgery.
- Piracy.
- Insider trading and market manipulation.

For above offenses, the FATF recommendations require financial institutions and non-financial businesses and professions such as casinos (which also includes internet casinos), real estate agents, dealers in precious metals, dealers in precious stones, lawyers, notaries, other independent legal professionals, accountants, and trust and company service providers to apply national measures to combat money laundering and terrorist financing, and in particular, in detecting and reporting suspicious transactions (World Bank and IMF 2009).

As to the process, money is laundered in three essential stages. *Placement* is the first stage in which illicit funds are separated from their illegal source and injected into the financial system. It also includes carrying of proceeds of crime, such as cash, across borders. *Layering* is the second stage where laundering the funds usually involves creating multiple layers of transactions that further separate the funds from their illegal source in order to make it more difficult to trace these funds to the illegal source (Lilley 2006). The last stage, *integration*, includes injecting the illegal funds into the legitimate economy so that criminals can use the funds without raising suspicion that might trigger investigation and prosecution (Schott 2006).

## The PKK and Money Laundering

The PKK was founded in 1978 by Abdullah Ocalan who was caught in 1999 and is now serving his life sentence in Turkey. Turkey has been suffering from the PKK terrorism since 1979 when the terrorist organization first started its violent campaign in Turkey by an attempt to kill a member of the Turkish Parliament in his house (Marcus 2007). To date, it is responsible for nearly 40,000 Turkish citizens' deaths. One of the reasons why the PKK has remained capable of operating, recruiting, and carrying out terrorist attacks not just inside the country but also in Europe and elsewhere can be attributed to the organization's capacity to survive economically by terrorism financing tools and control a huge amount of money, circulating especially in narcotic and other areas. In addition, money laundering activities of the PKK have also been an important component of its operations inside and outside the country (Roth and Sever 2007).

The terrorist organization PKK has long been known to engage in terrorism financing methods such as commission charges from all kinds of smuggling, extortion, and taxing. The drug dealing is considered as one of the biggest sources of the PKK. Although the PKK is believed to control 80% of the drug market in Europe, the organization usually deny any participation in the drug market. This could be explained by two reasons. First, if the PKK is seen as a drug dealer, it may lose its support in Europe. Second, if it engages in drug dealing, this may lead its members to use drug, thus degenerating the relations within the organization. Therefore, except for taking commission charges from drugs and weapons dealers, the PKK claims not to deal with the narcotic

production and distribution (Marcus 2007). Nevertheless, the PKK's engagement in all levels of narcotic trafficking was accepted by the international community including the US government (Laciner 2008). Given its significant involvement in international drug trafficking and money laundering, the PKK was recognized by the US Drug Enforcement Agency (DEA) as well established in the production and distribution of a variety of opiate products, and to be deeply involved in money laundering. The USA also designated the PKK as a narcotic kingpin in 2008 (Roth and Sever 2007).

In addition to drug dealing, the PKK's finance comes from many traditional and untraditional terrorism financing methods. Among them there is the so-called "revolutionary tax" provided by Kurdish businessmen in Turkey and Europe. The PKK also engages in protection rackets targeting Kurdish owned businesses across Europe where it collects millions of dollars annually from Kurdish businesses and individuals in Europe. In addition, the Kurdish Diaspora voluntarily provides funds to the organization through cultural associations and information centers such as Europe-based the Kurdish Employers Association, the Kurdish Islamic Movement, and the Kurdish Red Crescent, which also deals with money transfers through subsidiary foundations in Switzerland, Britain, Sweden, Belgium, Denmark, and Cyprus.

The accounts of former PKK members interviewed also revealed that the organization's funding comes from various sources including:

- Kidnapping.
- Commission charges from drug dealers.
- Charges in what they call the "organization's customs" from smugglers of weapons, fuel oil, cigarette, food, cattle, etc.
- Forcefully taken revolutionary tax and donation from ordinary citizens, artists and businessmen of Kurdish origin.
- Benefits of media outlets.
- Donation to charities and NGOs.
- Funds collected in social and entertainment activities.
- Direct funds from some states (state-sponsored terrorism financing).
- Direct provision of weapons, trainings, bombs, and ammunition from various countries.

Given the above-mentioned financial activities of the group, one can argue that the PKK has gone beyond a mere ideologically based terrorist organization since the PKK who claimed to defend the Kurdish rights in the region has walked away from a traditional politically motivated organization to a more complex and profit/interest-based and economically driven criminal network. This inevitably leads the organization to engage in money laundering activities. While the PKK commits offenses of money laundering, it does not launder illicit funds in financial intermediaries as other organized crime groups do. Rather, the group prefers using cash couriers consisting of its armed units who carry the funds from different sources to the finance center of the organization in northern Iraq. Money involved in the PKK activities usually comes in the form of cash, which makes it harder for law enforcement agencies to follow the money. In addition, for the PKK, money is not considered as an end, but as a means to continue the fight and trade for supplies (Marcus 2007).

Like many other transnational terrorist organizations, the PKK has benefited from dealing with organized crime groups that engage in lucrative businesses such as illegal trafficking of drugs, humans, and weapons as well as money-laundering activities mainly in Europe. As EU Terrorism Situation and Trend Report (2007) put it, two PKK members were arrested in France in July 2006 for money laundering aimed at financing terrorism. At the end of 2005, three members of the PKK were arrested in Belgium and another one in Germany suspected of financing the PKK. In Belgium, the authorities seized receipt booklets indicating that the arrested suspects were collecting tax from their fellow countrymen (Marcus 2007).

The most prominent evidence that the PKK engaged in money laundering came out of the Sputnik operations in 1996 and in 2002. In the first Sputnik operation conducted simultaneously

by the British Scotland Yard and the Belgian Police in London and Brussels, as well as in Germany and Luxembourg, it was revealed that the PKK was laundering the illicit financial gains from its drugs and weapons smuggling via the MED-TV Broadcasting Company, a media outlet and a screen corporation founded by a British citizen of Kurdish origin in 1995 and acting for the PKK (Houlton 2010). In that operation, the police were able to link an amount of $11 million seized from an account belonging to MED-TV to drugs, weapons, and human trafficking activities of the terrorist organization (Laciner 2008). The Belgian Police discovered that the PKK conducted its money laundering activities through 15 different companies (Roth and Sever 2007).

The case of MED-TV is very crucial to understand the money laundering activities of the PKK in that it served both for the media propaganda for the group and as a legal company to launder the dirty money of the organization. When the members of the PKK had difficulty to launder their illicitly obtained money, they decided to open an account by the name of "Kurdish Association" in England and "Sweden Postal" in Sweden for sending money to the MED-TV under the disguise of donations and consolidations.

The second Sputnik operation conducted by the Belgian and the French police in 2002 revealed that a Paris-based company linked to the PKK involved in money laundering activities. The PKK operatives detained in this operation confessed that money had been transferred to the PKK under the auspices of a company called the Kurdish Foundation Trust, which was located in the British controlled Jersey Islands, known as an offshore haven for international money laundering (Houlton 2010).

Another international police operation led by Belgian authorities and assisted by the Italian and French police was conducted against the PKK's operatives and companies in major cities in Belgium on March 4, 2010 (Houlton 2010). The operation resulted in arresting many high profile PKK members including two of its leading figures, Remzi Kartal and Zubeyir Aydar who since October 2009 have been on a US list of drug traffickers suspected of using smuggling proceeds to fund the PKK (Marcus 2007). The operation was based on the allegation directed against Roj TV-a successor to MEDYA TV which is also a successor to MED TV that was banned after the above-mentioned Sputnik operations and chief operatives of the PKK in Europe regarding its involvement in the financial fraud and tax evasion as well as distributing PKK propaganda, educating PKK members, recruiting members for the PKK, human trafficking, counterfeiting, and racketeering. The operation in which 300 Belgian police officers as well as tax inspectors from the finance ministry participated was launched in coordination with Turkish intelligence, which provided Belgian authorities with information and evidence on the links between the PKK and its European operatives (Houlton 2010).

The PKK has often laundered illegal money under the name of donation or aid via so-called business, cultural, children, and women associations in London, Frankfurt, Paris, Brussels, and other European cities in order to be spent for its television channels, weapons, explosives, militia training, etc. One of these organizations that provide money to the PKK in Europe is International Kurdish Businessmen and Employers Union (known as KARSAZ). The PKK acquired its arms and ammunition from the funds provided by KARSAZ which operates in Germany. The member companies of KARSAZ played an active role in laundering PKK's drug money to be sent to mainly the PKK camps in northern Iraq for purchasing weapons and ammunition (Roth and Sever 2007).

The cross-border transportation of currency known as cash couriers has been often used by the PKK for laundering money. The money collected from donations and businessmen in Turkey and Europe is brought to the financial unit of the organization's military wing, People's Defense Force known in Kurdish as Hêzên Parastina Gel (HPG), in northern Iraq and Iran by the reliable cash couriers. On the other hand, using the banking system is rare in the case of the PKK. However, hawala system or other money transfer methods such as Western Union were used to transfer money from Europe to its supporters in different countries such as Armenia and Syria to finance the daily needs of the members.

## Conclusion

It is no doubt that the PKK, just like many terrorist organizations, engaged in terrorism financing methods. And it is evident that as a fundraiser not just in Turkey but also in Europe, the PKK and the PKK-affiliated entities have needed to launder the illicit money through legal channels if possible (as seen in the case of media and front companies) and illegal channels if not possible such as using cash couriers.

Beyond being a terrorist organization, the PKK has also acted like a mafia by dealing with organized crimes – mainly the drug market – and money laundering. The fact that the PKK has walked away from a traditional politically/ideologically motivated organization to a more complex and profit/interest-based and pragmatically/economically driven criminal network has made it difficult for the governments to dissolve the group by traditional counter-terrorism methods since the current members and would-be members consider the PKK as a profitable organization that they can get respect and power by controlling this huge array of financial activities. Therefore, the policy makers should pay much more attention to the economic development of the region as an incentive for the group's members to lay down arms and end the violent campaign in the region.

In this regard, the PKK, both as a regional and a global threat, not only harms the regional stability in the Middle East but also endangers the Western and international security by taking advantage of democracy and liberal economy. Therefore, it becomes very important to cut resources of the PKK by tracing illegal money transacted under the name of donations, aids, and fundraising and by freezing the financial assets of its members while taking appropriate law enforcement measures in all countries they are operating. Given that the Achilles heel of any criminal organization is its financial survival, cutting lucrative businesses of the PKK will lead to degeneration and finally dissolution of the terrorist organization.

# Monitoring and Evaluation

Nasim Banu
Department of Development Studies, Islamic University, Kushtia, Bangladesh

## Synonyms

Policy formulation and execution; Project planning and implementation; Tracking and

assessment to surpass achievement on intending target of task

## Introduction

The concept of monitoring and evaluation (M&E) has emerged in the field of development administration as a techniques of objective planning and project implementation. Monitoring and evaluation is an approach to understanding the planning and implementation of development projects for achieving the desired goals and targets. M&E are extremely effective tools for improving plan formulation and implementation, eliminating time and cost overruns, and discovering organizational physical, financial, technical, motivational and/or administrative inadequacies with a view to remove the obstacles as well as improving beneficiary satisfaction to the level of expected objectives. M&E starts with the challenge of minimizing gaps between what is planned and what is actually implemented, what has been intended as the outcome of the planning and what has actually resulted. The success of planing depends on proper implementation of programs/projects. At all levels of project implementation monitoring and evaluation system provides feedback on the areas of success and deviation where improvement may be required. Conclusively, monitoring and evaluation helps the decision-makers and development managers to find out whether the policies and the progress of development project are on track, off track or doing better than expected targets set for performance which provide an opportunity to make adjustments, correct cause of action and gain valuable institutional, project, program and policy experience and knowledge.

## Definition

Monitoring and evaluation (M&E) is an element of a single management information system to effectively manage a task toward the achievement of intending results. In practice, M&E is described in the context of a plan which consists of tasks, programs, and projects with clearly defined objectives sought through the provision of sets of inputs. M&E promotes accountability and transparency in spending and ensures that resources are properly used to achieve targets/results of project including outputs, effects, and impacts. M&E system is developed to provide continuous feedback in the management process of monitoring and evaluation of progress of a project toward a given goal and, hence, promotes organizational learning, aid in promoting greater transparency and accountability within organizations, and the ability to demonstrate positive results helping greater political and popular support.

## Monitoring and Evaluation as Discipline

M&E is of relatively recent origin which is considered as a tool for effective, objective-oriented management of development projects that focused on tracking the financial and physical implementation of tasks and results. M&E activities provide the means for development planners and decision-makers to (i) monitor the progress of development activities during implementation and remain alert in cause of shortfalls or deviations; for early corrective action (ii) ascertain systematically and objectively the relevance, efficiency, and effectiveness of development activities and their impact of the intended beneficiaries; and (iii) understand lessons for future development planning for better formulation and implementation of projects. In a project cycle, M&E as a set of activities occur in at least four different post-planning stages like implementation or input-output stage, project completion stage or end of gestation period, post-implementation operation and maintenance or the output-effect stage, and full development of effect-impact stage (Figs. 1 and 2).

There are different approaches to M&E like:

(i) The bureaucratic approach is based on formats and put emphasis on compliance with formats.
(ii) The academic approach emphasizes rigor and its strength is generally the precision of its findings.

**Monitoring and Evaluation, Fig. 1** Cognitive model of monitoring and evaluation

(iii) The pragmatic approach stresses the fit between demand and supply of information, uses suitable techniques that allow the involvement of local professionals, and takes into account the characteristics of existing data and also emphasizes the dissemination of findings and lessons learned (Osvaldo 2000).

(iv) Technocratic approach that gives emphasis on expertise of the professionals.

## Distinction Between Monitoring and Evaluation

In their role, monitoring and evaluation are yet complimentary but distinct and not inseparable as indicated by the abbreviation "M&E." Monitoring is a process of measuring, recording, collecting, processing, and communicating information to the actors in decision-making and assessing whether tasks are being carried out according to schedule, the intended outputs/results are being produced on/within time in cost-effective manner, and the benefits are reaching the intended beneficiaries. Evaluation is a process for determining systematically and objectively the relevance, efficiency, effectiveness, and impact of activities in the light of the objectives. According to the Organisation for European Co-operation and Development (the OECD), monitoring is a continuous function that uses the systematic collection of data on specified indicators to provide management and the main stakeholders of an ongoing development intervention with indications of the extent of progress and achievement of objectives and progress in the use of allocated funds. On the other hand, evaluation is the systematic and objective assessment of an ongoing or completed project, program, or policy, including its design, implementation, and results with an aim to determine the relevance and fulfillment of objectives, development efficiency, effectiveness, impact, and sustainability (Michael and Joseph 1994).

**Monitoring** is as old as management; the ancient Egyptians regularly monitored their country's outputs in grain and livestock production more than 5000 years ago. Monitoring is performed to obtain data and information during the implementation of a project to enable the project authority to assess implementation progress with objectives, to take timely right decisions and corrective actions for ensuring progress according to predetermined schedule, and to achieve completion of project within given resources, cost, and time limits. Monitoring involves the provision of regular feedback on the

**Monitoring and Evaluation, Fig. 2** Typical structure of a national M&E system

progress of program implementation and the problems faced during implementation; it consists of operational and administrative activities that track resource acquisition and allocation, production, or delivery of services and cost records (Joseph and Bamberger 1994). Monitoring is an essential management tool that helps to improve the efficiency of an ongoing project and in the selection and design of future projects. The main purpose of monitoring is to identify the shortcoming, if any, at early stage regarding delivery of inputs and execution of activities on output production to facilitate corrective measures in time. Projects, which do not have an effective monitoring system, are more likely to suffer delays and cost overruns. Monitoring is basically concerned with the process of routine periodic measurement of project input activities and outputs; it is restricted to watching and overseeing but not questioning the project's objectives. Implementation, operation, and review are three distinct phases that monitoring conducts. The purpose of implementation monitoring is to gather information about projects to determine what is happening, how it compares with the current plan, and what needs to be done in the next. Operational

monitoring concerns with determining whether the project is operating according to plan and to discover the reasons for deviations, if any. Review monitoring is the process of extracting lessons and information from ongoing project for future action specifically to facilitate revision of the current plan and provide information to decision-makers on whether the project has proved as valuable as anticipated at the appraisal stage, including the indications of factors contributing to success or failure. A system currently being emphasized for the development projects targeted to the disadvantaged is termed as "qualitative monitoring." With the growing concern for assessing improvement in real-life situations of the target people, the concept of qualitative monitoring is now being widely used. Participatory techniques for data collection are the main theme and have contributed in strengthening the concept. In qualitative monitoring method, qualitative, not the quantitative, indicators are used in collecting data/information through people's participation by empowering them; this helps in finding required information to unveil the truth. Qualitative monitoring is flexible, respects human values and their freedom, enables gender-sensitive monitoring, and is extremely useful when the people need insight and reasons for unexpected reactions.

**Evaluation** is comparatively a new activity in project management. It is an organizational process for improving activities that are still in progress and for aiding management in future planning, programming, and decision-making. Evaluation is the analysis of a project activity in respect to its continuing relevance, efficiency, effectiveness, present and likely future outputs, effects, and impacts. It can assist decision-makers by providing information related to any needed adjustment of objectives, policies, and implementation strategies of the project, as well as providing information for future planning. Evaluation is carried out during implementation, at completion, and after completion of a project. Evaluation during implementation of project known as "formative" or "ongoing evaluation" examines whether the assumptions or hypotheses made during the project formulation/appraisal stage are still valid and/or adjustments are required to ensure that the overall project execution with underlying design, due to unforeseen factors both external and internal, may necessitate reexamination of the assumptions and the project objectives and activities that initiated in light of gained experience may require redefinition or sharpening of focus. Evaluation at completion of project termed as "summative" or "terminal evaluation" is undertaken from 6 to 12 months after completion of a project either as a substitute of ex post evaluation with short gestation periods or before initiating a follow-up phase of project. Evaluation after completion of project termed as "ex post or impact evaluation" is done at full project development after some years of project execution when it is expected that full benefits and impact of project have been realized. Evaluation is the link between implementation and planning and a continuing management process consisting of planning, implementation, and evaluation. Evaluation critically examines actual or potential results in order to maximize the impact of continuing activities and to provide guidance for planning new ones. Evaluation assists management in making appropriate and timely decisions resulting in improvements to their projects, makes better use of limited resources, and increases the knowledge of environment.

## Result-Based Monitoring and Evaluation

Traditionally, M&E approach focused on monitoring and assessing how well a project, program, or policy could be executed. This traditional approach does not provide policymakers, managers, and stakeholders seeking increased accountability, transparency, and results. Thus, the result-based monitoring and evaluation (RBM&E) has emerged globally for readiness assessment, agreeing on outcomes to monitor, selecting indicators to monitor, establishing baseline data on indicators, monitoring for results, emphasizing the role of evaluation, reporting the findings, utilizing the findings, and sustaining the M&E system within the organization (Kusek and Rist 2004). Result-based monitoring is a continuous process of collecting and analyzing

information to compare how well a project, program, or policy is being implemented against expected results. Monitoring part of RBM&E clarifies program objectives; it links activities and their resources to objectives, translates objectives into performance indicators, and sets targets. Result-based evaluation is an assessment technique of a project, program, or policy through ongoing or completed intervention to determine its relevance, efficiency, effectiveness, impact, and sustainability. Evaluation part analyzes why intended results were or were not achieved and assesses specific causal contributions of activities to results.

All together RBM&E systems are designed to address the fact that outputs have been generated and the activities that have taken place and to assess spending and achievement on objectives at any/all levels to provide feedback in time which can be used to better inform key for decision-makers. It provides feedback on the actual outcomes and goals of actions. RBM&E system is a modern and powerful public management instrument in helping measure and evaluate performance, track progress in achieving desired goals, and then feed this information back into the ongoing processes of governing and decision-making. RBM&E examines implementation process, explores unintended results and provides lessons, highlights significant accomplishment or program potential, and offers recommendations for improvement. RMB&E exercises at macro-level to understand the socioeconomic direction of a country and move to promote greater transparency and accountability on public spending. However, the importance and sustainability of RMB&E system depend on policy and bear genuine demand and appreciation for it. RMB&E requires ensuring necessary valid data is generated in timely and credible/reliable manner; data is examined properly to know insights of the progress; and findings are disseminated to the concerned agencies for further better action and also the need to ensure accountability and continuous capacity building efforts.

M&E is a description of management's needs for information about a project or program at government level of any, particularly developing, country. A strong M&E system helps in the identification of constraints of project implementation and helps in making the project a success (Ismail 1999). Thus, government decision-makers include M&E plan in the project concept paper (PCP) and ensure to direct activities according to the M&E plan while implementation and end of projects. Its application is desired at each stage of project cycle, i.e., project identification and preparation, selection and negotiation, planning and design, implementation and result assessment, management of operation, and identification of a new one. Hence, there is a growing understanding both among the donors and developing countries on the importance of monitoring and evaluation system as a tool for effective, objective-oriented management of development projects.

## Structure of Monitoring and Evaluation System

M&E system can be classified according to the level of integration and the range of activities. The level of integration and complexity of the M&E system tends to be related to the size of the country, its level of economic development and the numbers of projects supported by foreign aid, and its research experience and resources. In countries heavily dependent on foreign aid, monitoring usually begins at the project level. Once a significant number of projects are being monitored, a central monitoring unit, usually in the Ministry of Planning and Finance, may be created with primary responsibility for monitoring the use of foreign aid. The efficient planning and management of national development require timely and accurate information on the progress of projects, the extent to which projects are achieving their objectives in a cost-effective and timely manner, and the contribution of individual projects to the achievement of sectoral and national development objectives. Much of this information can be obtained through a national monitoring and evaluation system that provides the information required by policymakers and managers at the national, sectoral, provincial/state, and local levels. Many countries have established a special

project implementation ministry or agency devoted to increasing the efficiency of project implementation which is responsible for monitoring all major national investment projects and may also monitor programs initiated by the president or prime minister (Joseph and Bamberger 1994).

## Conclusion

Monitoring is an old concept, but evaluation began to emerge both at country level and in the UN system in the early 1950s, and since then, it has evolved slowly. Interest and activities in developing M&E within the UN system varied considerably during the 1960s and 1970s. Evaluation efforts when undertaken in connection with development projects or technical assistance activities were concerned more with disbursement and delivery of physical inputs and outputs than the nature of an impact on beneficiaries; however, this has been changing. There is a growing understanding, both among the donors and developing countries, of the importance of M&E as a tool for effective, objective-oriented management of development projects and programs. The rapid expansion of international development assistance in the 1970s created a demand for systems of control and accountability by donors and government agencies. At the national level, the principal stakeholders are the highest level policymakers, i.e., cabinet/council of ministers, national planning agency, office of the head of government, and to some extent the parliament. Other key stakeholders are the international aid organizations, who finance many of the major development projects and have urged national governments to provide better information on the financial and physical progress of project implementation. Many countries have a considerable degree of central economic planning but have had little discussion on beneficiary evaluation, in which the intended project beneficiaries play an active role in M&E project performance. However, beneficiary involvement in project planning and monitoring is implicit in recent decentralization legislation policies in a number of countries.

## Definitions of Terms

**Moral obliquity:** Deliberate obscurity of speech or conduct.

**Bullshit:** Bullshit is empty unclarifiable persuasive talk, which bring about smart's own benefit.

**Homophily:** Similarity breeds connections and birds of a feather flock together.

**Serendipity:** The Merriam Webster dictionary defines serendipity as "the faculty or phenomenon of finding valuable or agreeable things not sought for."

**Butterfly effect:** The Merriam Webster dictionary defines "butterfly effect" as a property of chaotic systems (such as the atmosphere) by which small changes in initial conditions can lead to large-scale and unpredictable variation in the future state of the system.

**Self-organization:** The Business dictionary defines self-organization as the ability of a system to spontaneously arrange its components or elements in a purposeful (nonrandom) manner, under appropriate conditions but without the help of an external agency. It is as if the system knows how to "do its own thing." Human communities too display self-organization: in every group a member emerges as the leader (who establishes order and rules) and everybody else follows him or her, usually willingly.

## Introduction

The African continent is replete with cases of moral obliquity promulgated by slanted and/or crooked government regimes imbuing the private sector and the local communities (Ntayi et al. 2012). The Merriam Webster dictionary defines moral obliquity as deviation from moral decency or sound thinking. The most recent cases of moral obliquity in Africa involve the former President of Mauritania, Mohamed Ould Abdel Aziz, who was implicated in wrongdoing and detained by the Economic Crimes Police and questioned over alleged slanted business transaction behaviors during his regime as head of state (Bilal Hussein 2019). Although empirical literature on the moral obliquity of leaders in business transactions is sparse, anecdotal evidence suggest that morally oblique regimes in Africa tending to walk the tightrope of presidential succession have started to emerge (e.g., Angola, Mauritania, Libya, Mali, Eritrea, and South Africa). Similar cases of moral obliquity are observed in South Africa during Zuma's regime where government leadership was trapped in morally questionable business conduct and/or behaviors (Mark Gevisser 2019). In one of the cases brought against him, the Constitutional Court of South Africa ordered Zuma to repay some of $16 million of state funds inappropriately spent during his regime.

It is these anecdotes and many other incidents in Africa which suggest that morally oblique leaders would prefer to avoid the question of succession by remaining in office for the rest of their lives. Despite this observation, the discussion about succession, leadership tenure, and moral obliquity is beyond the scope of this paper. However, since behavior breeds behavior, moral obliquity in state leadership may promote oblique behaviors in economic transactions. This paper uses the homophily theory and complexity theory to discuss an ethnographic case of the Kisenyi Community Market in Kampala, Uganda, and derive a model of ontological variants of moral obliquity with its associated constructs. The ethnographic lens allowed the authors to use induction and enter the market vendors' world and model the realities of moral obliquity. The paper is premised on the fact that today's business transactions are so complex and dynamic often punctuated with incomplete information, which makes it extremely hard for anybody to predict individual's behavior and make meaningful business connection with any assurance (Kay 2010).

A new stream of research from sub-Saharan Africa revealing the presence of a highly competitive business environment, operating under morally oblique behaviors such as outright theft, cutting corners, altering facts, and dishonoring

promises, and lying about certain things in order to protect self-interests has started to emerge (Ntayi et al. 2012). In many business transactions it is extremely hard to draw a distinction between individual's intended target and the "aiming point." Such unclear and morally oblique business behaviors exhibited in a complex and dynamic reality requires theorizing. The theorizing process require unraveling truth by examining persons as they interact with and within their socio-historical settings. Therefore, understanding the "what" and "how" about oblique behavioral phenomenon in such socially constructed reality would require an interpretivist's epistemology constructed from everyday experiences, concepts, and meanings (Blaikie 1993). Surprisingly, interpretivism epistemology has been given less attention by moral obliquity scholars, yet a number of businesses rarely achieve their goals through a direct path, but more commonly through oblique actions (Kay 2012). Kay (2011) suggests that obliquity is the best approach whenever complex systems evolve in an uncertain environment and whenever the effect of our actions depends on the way in which others respond to them.

While extant literature is awash with explanations of ethical behaviors and moral rectitude and their antecedents in a wide variety of business settings, research about what constitutes moral obliquity, the context in which it is enacted, thrives and its explanations in a community market setting is either sparse, anecdotal, and at best speculative. Ntayi et al. (2012) in their attempt to examine unethically questionable behaviors in Ugandan buyer–supplier business transaction revealed the importance of social cohesion in breeding connections that increase the availability of negative social capital which is used to defraud buyers. Although their study suggests that negative social bonding and social distancing operate to facilitate unethical business behavior, their results fall short of exploring the role of complex adaptive mechanisms in social bonding, social connections, market tactics, and ethical behaviors. Yet, Dehghani, Johnson, Hoover, Sagi, Garten, Parmar, Vaisey, Iliev, and Graham (2016) observe that moral similarities encourage social distancing in terms of how people connect and form associations. In spite of this observation, the types of moral similarities that determine this relationship and their adaptive mechanisms are still unknown. Moreover, due to the nature of these studies and limitations resulting from the participation of human subjects, conclusions from these studies are not easily extensible in the market settings characterized with transactional conflicts. This paper intends to address this gap in literature and to posit that moral oblique behaviors are a result of social similarities and bonding between market vendors resulting in homophily, complex adaptive behaviors, and insatiable market tactics.

The available anecdotes in Uganda indicate that the growth of moral obliquity is a result of decreased religious values in the population, continuous interaction with people who practice the same behavior, unemployment, and poverty (New Vision, 13, September, 2013). However, there is no empirical research to warrant such claims. Instead we see cases of moral oblique behaviors taking place in self-employed populations with seemingly thriving businesses. This seems to suggest that the community market environment provides a fertile ground and/or opportunity for probable benefits of obliquity, thereby creating the need to examine the epistemic variants and antecedents of moral obliquity in business transactions in a naturalistic market setting of the Kisenyi Community Market Traders in Uganda. This paper therefore borrows insights from the theory of homophily and complexity to explain the variants and antecedents of moral obliquity. Homophily theory predicts that people are more likely to interact with individuals similar to themselves in respect to a variety of qualities and characteristics (McPherson and Smith-Lovin 2002). Consistent with Crotty, Felgner, Davies, Glidewell, Villarreal, and Ahmed (2003), the authors use interpretive research paradigm to unearth culturally derived and historically situated interpretations of the moral oblique social life – world that exists in Kisenyi Market. In this paper we aim at discovering people's insights, share their meanings, and develop insights about the observed case of Kisenyi market (Bryman 2008). Therefore, we use data from the Kisenyi business

transaction case to capture reality and establish an ontological order in which moral obliquity is conceptualized. This case study presents pertinent observations and experiences while in close interaction with some traders in Kisenyi, an urban slum in the southwestern part of Kampala central division. This richer view of moral obliquity is important because our study helps us to gain insight into what needs to be incorporated into the understanding of moral obliquity. If we adopt these theoretically relevant insights, we can better explain moral obliquity in a context of a developing country. The paper deals with questions of how moral obliquity exists, what constitutes it, how it can be grouped, how it is related within a hierarchy of emerging concepts and constructs from the story of the Kisenyi Business Community, and what accounts for its existence.

## Experience from the Kisenyi Business Community, Kampala, Uganda

Though located in a slum, the Kisenyi Business Community is situated among the key productive areas of downtown in Kampala, Uganda. Given its close proximity to St. Balikuddembe Market (formerly known as Owino Market, Usafi Market) and even without official routes opened, people in the community thrive on such activities like carrying luggage from one business point to another shouting at the top of their voices local phrases **"*fasi-fasi*"** which literary means "give way." The community is a habitat to many Ugandans who migrated from rural areas of Uganda to the capital city, Kampala, in search of employment. The demographics of the area is characterized by the uneducated, educated, old, and children who are forced to work in all sorts of businesses undertakings including selling sweets on the street, food vending, metal works, apparel, artisan services, home goods, and so much more. One cannot fail to locate the market. Known for a large population and a number of criminal gangs in the city, Kisenyi presents itself as a busy and noisy part of Kampala throughout the day till very late in the night. It is one of the places in Kampala where ladies provide extra grip to their bags and men almost provide fulltime cognitive and physical protection to their pockets with their hands. The area is also home to diverse religious denominations ranging from Islam being the dominant as seen from the hijabs and thwabs wore by men and women, respectively, followed by the mainstream Christianity, evangelicals, and animists. Mainstream Christian young men and women are also seen on the sides trying to preach to whoever cares to listen, while shouts of evangelicals can be heard from a distance. The animists and the traditional healers are also busy performing curious arts, sorcery, and antiques, while all sorts of reptiles like snakes and tortoise can be seen obeying the master's voices. At around 4:00 pm, the Imam is heard from a nearby mosque calling people for prayers. There is an interesting coexistence of religious beliefs. **Daily monitor, Sunday April 7 (**2013**),** has described Kisenyi as: *Located just a stone throw away from the city center, Kisenyi paints the picture of a vibrant slum with many small-scale businesses thriving. In the midst of the bustle and hustle that characterizes most streets in Kampala, Kisenyi certainly lives up to this tune, the streets are noisy and crowded. Kisenyi is famous for metal works and grinding mills. To many, it is a place where certainly only the strong hearted can survive. It is one of the dirtiest slums with rubbish and filthy blocked drainage channels marking boundaries of the tarmacked road.*

Being one of the oldest and fastest-changing slums in the country, Kisenyi area has had both permanent and semi-permanent structures with dilapidated iron sheets. Thanks to the transformational efforts of Kampala City Council Authority to replace rusted tin roof buildings by malls, bus terminals, cottage industries, storied commercial, and residential structures. Residents there now boast of having tap water, communal restrooms, tarred connecting roads, street lights, mobile money services, Internet cafés, and you name it. The area is also characterized by some of the worst drainage systems in Uganda which is a threat to both humans and the environment, which are inextricably linked. To the world, it could easily go for a rough complex zone in a rather peaceful city. With this kind of status in the eyes of a common man, even field tasks like photography to beef-up observations and

reporting become tricky unless you have moved with a common dweller in the area or seek permission from a local council (I)[LC1] chairperson who is very hesitant to participate in research.

Upon arrival in Kisenyi Community on 20th January, 2020 at about 3:00 pm, a very lively community was found with the congestion in terms of activity and personnel on site almost compared to a beehive activity. Here the hustle and bustle are real, with thousands of people cooperating in business tasks resulting in inevitable surprises. Every market vendor contributes to the survival and continuity of business transactions by outsourcing product items that they do not possess. The collaborative relationships and the separation of tasks of the market vendors is an interesting survival instinct. I keep my eyes open, not only to avoid being knocked down by the boda-bodas passing by, but also the multitude of people rushing through the area, carrying sack loads on their shoulders and heads.

Both formal and informal sectors converge in this area as seen from the makeshift shops, upcoming arcades, stationary shops, retail and wholesale shops, and a few money lender offices. This market accommodates all kinds of people interacting at many levels of social, cognition, and action domains. This is seen from the dress code – some are in suits, casual dressing, particularly the African fabric for the women who dress casually in socks perhaps to keep their feet away from the rough surface, occasionally with old and worn out aprons and head gears and the conduct of the people in area. While some speak in low tones, others shout at each other and occasionally ragged and or drugged people are seen sniffing aviation fuel from small bottles while some engage in fights. The smell of hemp suddenly engulfs the area and no one seems to care despite the anti-cannabis policies in place.

Much of the language is slang and to fit in, one has to embrace the same. As one might imagine, a simple effort to twist from the usual to slang makes life easier, thus the shift during this visit started with juts, the common fist bump with potential suppliers and/or sellers. With all micro-businesses running on principals of innovation and focusing on results, the moral rectitude is forgotten. Generally, many businessmen and women exhibited lack of any moral fiber creating a need for proper understanding of the underlying factors behind the dubious deals that the area is known for. Also, children of school-going ages are seen carrying out odd jobs such as collection of plastic bottles and garbage collection in a bid to earn a living. In this case study, the innovation was seen right from the roadside food vending to by fabrication works in various workshops. Of interest was the imitation of designs from various leather suitcases utilizing metal work skills which many of the teams got through apprenticeship. To them, the aspect of grit comes in string if you are to survive in business.

### The Business Transaction Experience

In a bid to get the feel of a typical business transaction, interest was taken in the welding and metal fabrication section of the market, given their fascinating skills in innovation. The metal fabricators do not have any form of protective gear save for a few who have sunglasses to protect themselves from the welder's sparks. Uniquely fabricated doors, flower stands, window frames, and gates many of which are made on order are seen on display, however, electricity is illegally connected from the nearby electricity poles which pauses a risk to the environment. Sharp sounds from gas metal arc welding machines are a common feature in the area. This sound tends to irritate and disturb the ear depending on the mechanism that generates it. The sounds come from noisy operations and equipment including welding, foundries, pneumatic equipment (e.g., jack hammers, chipping hammers, etc.), machine tools for forming, dividing and metal cutting, and grinders among many others. By the time you traverse the metal fabrication section you will be suffering from noise-induced hearing loss. The sound pressure levels depend on the total mechanical or electrical energy transformed into acoustical energy.

The most interesting thing is that beneath the filth of Kisenyi Business Community lies ingenuity in its latest form. One can see a variety of nice sight appealing steel products ranging from general fabrication (metal doors and windows, gates,

water and fuel tanks, burglar proofing parts, motor vehicle bodies, brick-making machines, moulds, metallic chairs and beds, tables, etc.) to catering and kitchen equipment (popcorn machines, food warmers, ovens, roasters, cook stoves, nut grinders, and fruit juice extractors), forging (customized fabrications, hinges, latches, door and window designs, gate designs, sports tools, and other traditional tools), light machines and auto parts fabrication (tricycles, welding machines, vehicle front and rear protective bars, silencers, etc.), industrial machinery (agro-processing machines, packing machines, etc.), and foundry (cast iron and aluminium spares, some vehicle spare parts spacers, bushes, bolts and nuts, weighing scales, bull bars, saucepans, moulds, etc.). There is an incredible ingenuity that comes with the metal fabrication.

Unique in this area is the pricing format for the goods which takes the form of price discrimination, charged depending on the way customers appear and present themselves. Many customers are ignorant about the market and therefore unable to make informed choices about their products since much of it is either deliberately withheld or the traders also have scarce knowledge about the products, they trade in to the extent that when one asks many questions, the trader asks what you want. The traders take advantage of this ignorance and boldly tell customer to either buy or leave. With no warranty, the traders simply sell you whatever they have and hope you never go back again, although the vendors we visited assured customers their ability to help out with minor repairs in case defects attributed to poor workmanship are detected. While customers consider the price in exchange for the quality of the metal-fabricated products, many traders confess that quality comes secondary when making money.

The moment a customer appears and shows interest in a product item, about five to ten people come and crowd the area and starts listening to the conversation they are not privy to, ready to give unsolicited advice with a view of either wooing the customer to their side or confusing the customer and in the process steal from them. If you are very critical and observant of the actions of the vendor agents, you can quickly take flight. A customer with a timid personality, frightened by numbers may not easily transact business in such an environment and that may perhaps be one of the reasons why the middle-income class shun these places in preference for the more organized setups like supermarkets. Most of our customers go to the markets credulous of the unethical business practices of the Kisenyi vendors.

Among the group of people who crowded my territory on my arrival to the metal fabrication area was an impressive strikingly smart corpulent young man who introduced himself as "Smart." He easily won my attention. Authoritatively, he told his colleagues to step aside to which they obliged. Later, a one known as Goddie joined Smart. Goddie was a plump short man with a mean look and unlike smart, he seemed too reserved and conservative. He played an observer role most of the time and occasionally communicated through signs despite the fact that he was not dumb and the people around kept on saying that they (Smart and Goddie) had got their prey. The use of sign language made me uncomfortable but Smart kept on saying that all was well. I later came to know the names of these individuals were not real but pseudo names informed by their character. They were hesitant to divulge their names and advised that those were their "work" names.

Impressed by the ingenuity of their work, I quickly pointed at two finished flower vase stands which I ordered immediately. "Smart" quickly pointed at some already finished stands and price tagged them for a whooping UGX100,000/– which I paid for, on sport without any hustle. When I requested for a receipt, Smart was quick to state that they do not issue receipts. Lateron, I came to learn that, Smart was neither the owner nor an employee but had been left behind by the owner to caretake. Refusing to issue receipts was and still is a deliberate attempt to evade taxes and also possibly kill traceability in case of complaints. No sooner had payments been done than the person who placed the order appeared and got perplexed. The woman yelled at me in local dialect: "*nyabootwalawasitandizange?*" literally translated to mean

"*Madam where are you taking my flower vase stands?*". To my consternation, everyone around was unbothered and business continued as if nothing had happened and that is when the reality struck me that I had been cheated. Some of the people who had crowded the area told me to leave because the person I had dealt with had disappeared. However, I insisted that I would not leave the workshop until I got value for my money. You may imagine the kind of commotion I thought would spring up. I quickly stopped and told the claimant that had purchased the same at UGX 100,000/−. Surprisingly, the lady had also bought the same flower vase stand at UGX 60,000/− which she had left behind hoping to return after buying a few foodstuffs. I was left wondering how the woman would have felt had she not found me taking the flower vase stands. Remember, those fabricators do not issue receipts. Meanwhile "Smart" and other people who crowded the workshop at my arrival had disappeared. I painfully handed over the stands to the lady who seemed to have been filled with rage and ready to fight. I then quietly inquired from the remaining young men where Smart had gone. "Goddie" told me to wait until the lady leaves. When she eventually left, Goddie made a hand signal and Smart emerged from one of the temporary structures saying" "*mwanademuebaddeetutwala*" literally meaning that "*the woman was going to take us on.*" Smart seemed to have been betrayed by his colleague as he expected me to have left too. I was told that the city was for the "wise." Those words brought the fact that they were aware that whatever they were doing was wrong but had to survive – breeding the element of *survival perhaps for the shrewdest in action.* It seemed like society had embraced such behavior and everyone was not bothered by what "Smart" had done. It became evident that some people in that community have accepted people as they are in as much as they do not tolerate unacceptable behavior.

Later, I was provided with another flower vase stand as replacement of the ones that had been purchased before and off I went still contemplating on how chanced the two buyers were or how lucky the researcher was that the person that had sold to her the items belonging to another person was actually known and willing to provide an alternative.

## Ontological Variants of Moral Obliquity

In this section we begin with general observations about the Kisenyi Community Market realities, attempt to probe, evaluate, and deduce the concepts attached to the underlying ideas and move on to the discussion of "impersonal" (passive and reflective) constructions underlying moral oblique metaphors which guide us in generating theoretical justification for the presence of moral obliquity. The reality of the Kisenyi Business Community is taken in order to create a representation of the deviations from moral rectitude hereafter referred to as "moral obliquity." The derived model of moral obliquity attempts to provide relatively stable general features and axioms of Kisenyi Business Community that are relatively interesting from a scientific point of view. Consistent with the Kisenyi Business Community story, there were multiple actors who demonstrate substantial heterogeneity. The interactions with the traders reveal a significantly diverse community with many people playing different roles to sustain the groups. These agents emerge through organic self-organization and adaption to the norms and customs of the community. The different agents are fully aware of their capabilities and what to pass on to other agents. Figure 1 presents a summary of the ontological variants of moral obliquity which include deception, moral obscurity, dishonesty, and bullshit as described in subsequent sections.

### Deception

The Kisenyi Business Community case reveals the presence of deception. Smart demonstrates his intrinsic intentional capability to dishonestly sell off a metal fabricated flower vase stand to Viola (the unsuspecting customer), which he had already sold to Victoria. Smart carefully crafts and presents persuasive misleading statements through malevolence, irresponsibility, and sloppiness to Viola which results into a sale. Smart tells Viola that most of the items on display are free for sale without raising Viola's suspicion to the

**Moral Obliquity in Business Transactions in Sub-Saharan Africa, Fig. 1** Categorizing moral oblique behaviors among market vendors

contrary. Smart is proficient in presenting, articulating, and actively closing a sale by misrepresenting the truth and failing to disclose information related to the metal-fabricated flower vase stand sale. Smart sells Victoria's item to Viola at a cost of US$28.57 which Viola had acquired from him at a cost of US$18.57 raising the question of Smart's moral uprightness (The USD – UGX exchange rate for Thursday 10 September 2020 was 1 USD = 3705 UGX). Smart uses tactics that increases the chances of persuading Viola to buy an already sold item which she would not have done if she had known the tactics. One wonders whether it is morally right to sell someone else's product for a profit. Smart lacks virtue in so far as receiving more than he ought to, making Viola suffer loss through overpayment. Interestingly, Smart made a deliberate attempt to create an untrue picture in Viola and Victoria with the intention to mislead because of the material benefit he was expecting from the transaction regardless of the effects of his actions on the two customers. Smart gets out of this case neatly because there are no punitive measures resulting from his actions of deception. Smart "intentionally distorted facts about the availability of the metal fabrication stand vase" with an aim of instilling a false belief. We see deception manifesting in form of a lie.

The deceptive behavior of Smart braced by his group members present at the metal fabrication workshop is consistent with the works of Tayfun Aykac, Robert Wilken, Frank Jacob, and Nathalie Prime, (2017) who found deception to be a commonly used negotiation tactic in business. Their work reveals that teams use deception by commission (active misrepresentation of preferences) and deception by omission (passive misrepresentation) in business transactions to attain higher negotiation profits than individual negotiators. This revelation partially explains the sudden appearance of certain group of people at the market pretending to be welcoming customers wherever a buyer appears at the market vendors stall, which disappears upon conclusion of a transaction. This is an adaptive mechanism for the market vendors at Kisenyi community market. This is consistent with literature from evolutionary science which considers deception as socially adaptive behaviors employed for survival purposes (Levine 2014; Levine 2019; Thomas and Biros 2020). The case presents Smart, a caretaker of the metal fabrication workshop, assuming its ownership, and knowingly selling an item which had already been bought by another person. His actions clearly show that he was promoting his own selfish interests. Here we appreciate the fact that Smart focuses on his gain when deciding to lie without minding on how much the other party will lose. The price of the flower vase stand was inflated thereby attempting to cheat the customer. Goddie knowing how much Viola would lose, asked her to wait until the first customer leaves to get her a solution. The ensuing discussion has theoretical implications because market deception is a sufficiently complex domain of deception to warrant its distinct research study. Marketplace vendors, customers, regulators, and scholars have differing worldviews based on their cultural backgrounds, values systems, educational backgrounds, and professional training. Customers face emotional difficulties narrating the veracities of marketplace deception. Whereas some scholars have used a legal lens to interpret market deception, other scholars see the problem through the filter of their disciplines.

### Moral Obscurity

The Kisenyi Business community case presents another interesting perspective of the science of being unraveled in obscurity. Smart's decency, civility, and character in business remain obscure as he conceals information from his customers and misleads them with a hidden intention to defraud. Smart and the members of the metal fabrication workshop conceal, distort, and present confusing information to Viola concerning the sale of the fabricated flower vase stands and yet living for the good should be everyone's jurisdiction of reason. In reality information for making an informed purchase decision was withheld from Viola and yet being good and truthful in business transactions is important as it promotes reason, justice, and happiness. I must say that the group's ability to conceal Smart's intentions and actions from Viola had turned out to be a highly effective stratagem, if Victoria had not found Viola at the workshop on her return. This claim holds water because there is overarching evidence in the case for imputing scheming intentions to Smart and his accomplices. Secondly, Smart has obvious monetary undercurrents attached to his obscurity. The Kisenyi case confirms that desires for the vendors' money and profits are all more easily and swiftly obtained when one departs from what is most true and good. That is a moral construction one makes when he experiences the reality of the Kisenyi Business practices.

Goodness and truth are at bay at Kisenyi Market since it is an inefficient means to securing joy and happiness of the market vendors. In either case the groups obscurantist actions caused harm and waste to Viola and Victoria. The waste mainly involves the two clients who wasted time in trusting Smart and the workshop instead of enjoying their purchase experience and having a fulfilling shopping experience. The harm occurred when obscurantist information was used as grounds for purchase action. Smart voluntarily falsifies data to manipulate the customer's ontological shopping experiences through camouflage. These are a little bit difficult to detect because sellers often act in areas where information is lacking under a mask of good faith. The seller is one who is aware of his bargaining power and uses his position to take advantage of the unsuspecting buyer through obscurantism. These masks of good faith use personal power to infiltrate markets for the sake of material gain/benefit. This gives them ontological leeway to provide guidance to unsuspecting customers and keep them under their yoke. Most prospective customers who are not yet free beings remain in this situation. Not many customers miraculously survive obscurity the way Viola did. Moreover, there are talented fraudsters, and we all know illusionists who have the art of "showing off. "Obscurity uses invented words calculated to hide something real and overcharge in the guise of good and bad negotiation tactics.

### Bullshit

The Kisenyi Community Market demonstrates typical bullshit created and circulated by market vendors. Bullshit is empty unclarifiable persuasive talk, which bring about Smart's own benefit. Smart is "indifferent to how things really are" and "unconcerned with telling the truth" with an intention to mislead (Bullshit), yet truth is the bedrock for the prosperity and survival of business in a competitive environment similar to that of Kisenyi. This case reveals how Smart uses bullshit to conceal, impress, and coerce customers into buying his fabricated metal flower vase stand. Many small businesses in Kisenyi tend to survive on bullshit. This practice is consistent with the findings of Frankfurt (2006), who found bullshit to be a coercive strategy for entrepreneurs in harnessing fear and promote confidence in their perceived belief that they are benefiting from its power. What we see in Kisenyi market is vendors are a reflection of the complex adaptive behaviors in which individuals in the market community self-organize, network, and adapt a business practice that allows vendors to compete and survive in a volatile market environment. From the story, when Smart disappears, Goddie steps in and swings into action and like bees which have the ability to quickly identify a problem and organize themselves to solve it, the traders too are able to overcome such challenges by working together as a group. Healthy competition between market vendors is visible as they try to woo prospective

customers. No wonder bullshit has to be fully embraced as the best coercive strategy in trying to convince customers that they meet the demands of consumers. The Kisenyi business community is a networked environment nested in complex market social network interactions and relationships. During the visit to the community market, one can easily see other vendors in the likes of Smart moving from their stalls to other vendors' stalls picking items, bringing them over to his/her stalls, and presenting and selling them to customers as their own products. The use of sign language, yet he is not dumb, is a common feature of this market as demonstrated by Goddie. This study reveals some evidence of lying in the use of nonverbal cues, body motions, use of syntax, and contextual cues. These are some of the communication behaviors that one has to watch out for while transacting business in Kisenyi. Such communication patterns are examples of adaptative mechanisms used by the Kisenyi market networks to survive. In this paper, we observe manipulation and cheating of customers as a key feature in the Kisenyi market.

It is not all joyful and rosy getting what you need and want in the Kisenyi market since you have to wade through uncharted waters. As soon as you arrive, vendors and/or dealers suddenly appear from every direction shouting at you calling you aunt, uncle, brother, sister, or Mzee. Before you respond someone will be pulling your hand away and taking you to his/her stall as you are being pushed, pressed, and jolted through the narrow stall corridors. Given the competitive nature of business in the Kisenyi market, bullshit jargons are inevitable in presenting sellers with over inflated image of their products with strategic narrative aimed at selling off products. This is a place where the realities of Bullshit and the "Survival of the fittest" are lived and experienced. Some vendors are looking to make a quick buck and as a result they promise all sorts of things ranging from quality, "unique reputation," personalized customer care, solutions oriented, provide beauty, and personal responsibility. By espousing empty buzzwords, market vendors are able to guarantee their customers they are doing the right thing. Goddie acts like he cares much about the fate of the customer and his assurance that something would be done although he belongs to the same group with Smart. He is seen to take charge of the situation.

## Relationship Patterns Among the Antecedents of Moral Obliquity in Uganda

A number of constructs derived from the story and their relationships are presented in Fig. 2 to form a conceptual framework. This conceptual framework brings together constructs and/or metaphors derived from the homophily theory, the complexity theory, and empirical findings from the literature explaining in part the realities of the moral obliquity story from the Kisenyi Community market. It is used to show relationships among these ideas and how they relate to moral obliquity.

### Market Homophily, Voracious Market Tactics, and Moral Obliquity

Examination of the unfolding events at Kisenyi Community market reveals the presence of strong close contacts (bonds) between market vendors in Kisenyi market. Market vendors share similar qualities, characteristics, and ambitions which tend to provide a social fabric and lubricant for interactions, thereby influencing their level of honesty, trust, deception, obscurity, and bullshit. As seen earlier, market vendors exercise certain forms of greedy behavior which exerts transience on their prey, as they compete for resources, and offer opportunities for their own unsuspecting customers. Their actions are consistent with the theory of homophily which asserts that "Similarity breeds connections" (McPherson et al. 2001, p. 415) and "birds of a feather flock together" (p. 417). This observation is further supported by Byrne's (1971) similarity-attraction hypothesis which predicts that people are more likely to interact with those with whom they share similar traits. Market vendors possess network ties developed for information, advice, and resource exchanges that are needed to accomplish their morally oblique market transaction tasks. This is especially true if one analyses how market vendors use their idle time to socialize and engage in

**Moral Obliquity in Business Transactions in Sub-Saharan Africa, Fig. 2** Conceptual framework for moral obliquity variants and antecedents

idle talk when they do not have customers to serve. The idle time and idle talk enable them to form a strong social bond in order to generate and approve bullshit from peers. This activity which originates from one stall spreads to other stalls in the same market until a butterfly effect is achieved. This unreasoned idle talk is usually attractive, inoffensive, and is intended to promote social relationships among the market vendors in the market. If you want to lose friends and be alienated from market vendors in Kisenyi Market, start questioning bullshit.

Additionally, Kisenyi market is replete with cases of predatory market tactics arising out of existential autonomy of the market vendors. When the market conditions do not allow them to achieve their life meaning, market vendors start searching for a meaning that makes sense to them in form of survival. This may mean exploiting opportunities within themselves with an intention to either deceive or defraud customers. In this case we see a selfish character of the vendors which promotes coercion, wantonness, and volitional division or incoherence. It is not uncommon to find market vendors using phrases like "a *man eateth where he worketh.*" This phrase clearly illustrates the fact that somemarket vendor will do anything as a means of survival. The ontological account of Smart's human nature explains his behavior. This behavior is informed by the "short-term gains" mentality and the absence of a sufficient number of good role models in the market communities. From the market side, where Smart was operating from, there were other metal fabricators whose items seemed to be a little more expensive

and like many buyers, Viola sought to save some money by taking the cheaper option which later turned out to be expensive. Smart and group intentionally lowered the prices of their items in a bid to attract customers. This behavior is consistent with Sullivan (1977, p. 111) who observed inter alia that the predator's conduct is calculated to impose losses on other players.

#### Complex, Voracious Market Tactics and Moral Obliquity

The Kisenyi vendors invite every prospective customer passing. They quickly profile them before making a decision to attack. After convincing the prospective customers to listen to them, the market vendors decide the time they should spend "handling" him/her before they search for another customer. The market vendors have developed the rules for attack that maximize the long-term material and/or financial gain. Specifically, their model supports them to ignore low-profitability customer types when more profitable customers arrive. This is understandable because they prefer saving the time, they would have taken handling low-profitability clients to search for more profitable clients so as to earn a higher rate of return. Their tactical choices of attack may depend on the state, appearance, and behavior of the prospective customers. Coalitions and alliances existing in Kisenyi market unravel the beehive like activities. A critical look at bees in light of their instinctive partnership qualities reveals how they agree to work together momentarily in a partnership to accomplish a superordinate goal of mutual interest. From the moral accounting perspective of reciprocation, Smart's actions evoked an obligation on Goddie as displayed by his actions towards Viola. Goddie is forced to exercise fairness on the part of the group for actions of another person. While Smart does not seem to have been penalized, by Goddie, providing an assurance that the situation would be handled was an alert to the members of that community so that such actions would not tolerated by the customer. From the story we can infer that the businessmen are ready to do whatever it takes to survive. Smart knowing that he could be punished immediately hid.

## Conclusion and Implications

### Conclusion

The story of Kisenyi Community market reveals that Moral Obliquity in Uganda comprises the following ontological variants: deception, bullshit, moral obscurity, and dishonesty. Such moral oblique behaviors are common in Kisenyi Business Community market. These behaviors are associated with complex adaptive behaviors, market homophily, and voracious market tactics which characterize the business environment in the Kisenyi Community market. The sellers and dealers in this business area do not seem to have governing principles. Everything they do is based on chance and new market vendors are initiated in their social networks and forced to follow similar practices. Additionally, the complex business environment has taught the Kisenyi business community to adapt beehive behaviors, increase levels of connectedness, social bonding, and emotional support which ease the development and spread of moral obliquity among the members of the business community.

### Theoretical Implications

The application of Homophily theory (McPherson et al. 2001; Monge et al. 2003) and Complexity theory (Goldstein et al. 2010) to explain moral obliquity at Kisenyi community market in this paper implies that constructs derived from homophily and complexity theory blend to explain moral obliquity in diverse business environments. This means that interactive behaviors among individuals similar to themselves in respect to a variety of qualities and characteristics can explain the concept of moral obliquity in diverse environments. The paper advances the view that interpretive philosophical perspective and case study can be useful in documenting an in-depth understanding of human behavior related to moral obliquity in business communities.

This paper was guided by the interpretive philosophical perspective. The interpretive perspective was preferred because of the desire to have an in-depth understanding of human actions/behavior during business interactions in Kisenyi Market and their relationships with the social environment. This was deemed necessary because the extent to which individuals deviate from moral rectitude can be objectively assessed through observation and by participating in the activities of the market. Moral reality is objective, constructed by social interaction and internally experienced by market vendors who constitute membership of the Kisenyi Market society (Sarantakos 2013). The paper therefore undertook a task to examine the moral oblique behaviors of market vendors in Kisenyi, how they relate with others and several aspects of their life, such as socioeconomic interactions, their business interaction culture, and history. Ideas from the case were necessary in order to perceive market vendors' action in the context of the whole market system. We used participant observation combined with other unstructured and structured interviews to collect data. Some members of the research team became part of the phenomenon under investigation in order to be able to feel the way people do in that situation. They were actively involved in the market vendors' daily lives. This method allowed the authors of the paper to unearth reality behind moral obliquity and to obtain insights into the market vendors' worldview and social relationships.

### Practical Implications

The Kisenyi Community market case unveils the practices of deception, bullshit, dishonesty, and moral obscurity as variants of moral obliquity. This implies that business organizations that are looking towards improving the business environment may need to work towards preventing the spread of such behaviors by working on the antecedent constructs of complex adaptive behavior, market homophily practices, and voracious market tactics as antecedents of moral obliquity in business communities in Uganda.

[3]University of California, Irvine, Irvine, CA, USA

## Synonyms

Accountability; Culpability; Fault; Liability; Obligation

## Definition

Moral responsibility concerns the extent to which a person believes that another individual or group is blameworthy and ought to be accountable for violating standards of conduct by either behaving in an unacceptable manner or failing to behave in an acceptable manner.

## Introduction

The perspective presented in the current entry is rooted in theories of morality that identify the general scope of moral concerns and also acknowledges that there exists considerable variability in whether or how a given individual ascribes moral relevance to a particular action or situation (e.g., Graham et al. 2013; Skitka et al. 2005). The description of moral responsibility included below also draws from social psychological theories of responsibility and blame. These theories identify when people are more versus less likely to judge others as culpable for their actions or omissions (e.g., Malle et al. 2014; Weiner 1986). The sections that follow begin with a discussion of the differences between moral and nonmoral responsibility judgments based on psychological theories that define the moral domain. Next, attributional antecedents of moral responsibility judgments are described. Finally, the current entry ends by discussing the consequences of moral responsibility judgments for subsequent evaluations regarding blame, praise, and others' character.

## General Orientation of the Current Entry

Before proceeding, it is important to note that the general orientation in the current entry toward moral responsibility is descriptive rather than normative (see Bauman and Skitka 2009; Treviño and Weaver 1994). The theories and research reviewed concern how people assign moral responsibility rather than theories of how people *ought* to assign moral responsibility. The term "moral" is also used to refer to an individual's standards regarding fundamental right and wrong (e.g., Skitka et al. 2005, 2015) rather than "ethical," which often is used to refer to consensus standards of right and wrong within a larger community (e.g., Jones 1991). In practice, individual morals and community standards of right and

wrong often correspond (e.g., most people agree that murder and fraud are wrong). Nevertheless, many of today's most contentious public policy issues are rooted in competing visions between those with opposing moral views (e.g., people apply different moral principles to debates about healthcare system reform, levels of taxation, and relations among business, government, and society), and individuals often differ in terms of how strongly they feel about a given issue or event, even when it is categorized as (un)ethical based on community standards or normative philosophy (Skitka et al. 2005). In short, the differences between moral and ethical issues, as interesting and underexplored areas of inquiry, and this brief discussion are included to draw attention to potential benefits of distinguishing between the two. That said, there also are important differences between judgments of responsibility that are and are not morally relevant for a given individual. These differences are addressed in the next section.

## Moral and Nonmoral Responsibility Judgments

Some judgments of responsibility are morally relevant and others are not. If, for example, Casey is responsible for bringing decorations to the company holiday party, Casey's success or failure to bring decorations is not likely to lead to moral praise or condemnation. In contrast, if Pat is responsible for delivering medicine to a child who desperately needs it, then Pat's success or failure is much more likely to evoke moral judgment. Many classic theories of responsibility do not explicitly discuss whether or how moral responsibility judgments differ from responsibility judgments in general (e.g., Shaver 1985; Weiner 1986). However, considerable variability exists in the phenomena that people imbue with their subjective sense of moral right and wrong (Ryan 2014; Skitka et al. 2005, 2015). Theories that attempt to explain the differences between the moral and nonmoral domains therefore provide important information about the characteristics that distinguish moral from nonmoral responsibility judgments (e.g., Graham et al. 2013; Gray et al. 2012; Skitka et al. 2005).

Theorists have taken different approaches to distinguish between moral and nonmoral judgments. Some have identified psychological attributes that are more likely to accompany moral than nonmoral beliefs and judgments. People experience their moral beliefs and attitudes as (1) universally applicable imperatives; (2) objective facts about the world, much like scientific facts; (3) independent of authority decisions or dictate; and (4) imbued with strong emotions (Skitka et al. 2005). Other theorists distinguish between moral and nonmoral judgments by identifying categories of actions or events that people are especially likely to moralize. For example, moral foundations theory predicts that people's moral beliefs stem from at least five distinct concerns: care/harm, fairness/cheating, loyalty/betrayal, authority/subversion, and sanctity/degradation (Graham et al. 2013). People vary in the extent to which they base their personal moral sense on any one of these "foundations," and behaviors seen as relating to one or more foundation are more likely to trigger moral responsibility judgments.

Still other theorists distinguish between moral and nonmoral judgments by identifying relational structures that establish moral relevance. According to the dyadic model of morality, judgments of moral responsibility involve situations that concern "moral agents" who harm "moral patients" (Gray et al. 2012). In other words, responsibility judgments are morally relevant if the target of judgment is capable of willful action, he or she commits an act that involves inflicting "harm" (broadly defined), and the recipient of the target's actions has the capacity to suffer from that harm.

## Components of Responsibility

Attributions of responsibility are the product of multiple component judgments, above and beyond the differences between moral and nonmoral responsibility. The list of components has expanded and evolved over time, which has created a literature where definitions of "responsibility" are varied and at times imprecise (see Malle et al. 2014). However, there is a growing

consensus that the following criteria influence the extent that people hold actors responsible for events: causality, intentionality, the actor's role or status, and the magnitude and valence of events (e.g., Cushman 2008; Malle et al. 2014; Treviño 1992).

**Causality**. Determinations of causality attempt to establish actors' basic levels of involvement in an event (Cushman 2008; Shaver 1985; Weiner 1986). Often, causality judgments follow a "sufficiency criterion;" that is, people conclude that a person caused an outcome if that outcome would not have occurred in the absence of that person's action (Shaver 1985; Weiner 1986). Of course, determinations of causality also can reflect an actor's decision not to intervene in a situation (i.e., behavioral omissions). However, people treat omission and commissions differently because they differ in terms of whether they involve physical movement, the salience of alternative causes, and whether the outcome would occur if the actor were not present (DeScioli et al. 2011; Spranca et al. 1991).

**Intentionality**. Causality is an important component of responsibility, but people routinely differentiate between intentional and unintentional causes of outcomes (Heider 1958; Malle 1999; Shaver 1985). Moreover, bad intentions sometimes are sufficient to prompt condemnation, even if a person did not successfully cause a negative event (Pizarro et al. 2003a; Young et al. 2007). Judgments of intentionality are themselves multidetermined; there are five elements of intentionality: desire, belief, intent, awareness, and skill (Malle and Knobe 1997). People are more likely to consider an action to be intentional when the actor exhibits a *desire* for the outcome to occur and *believes* that an action would lead to the outcome. The actor also needs to *intend* to perform the act by choosing to perform the action rather than acting by accident, and the actor must be *aware* of the act while performing it. Finally, people consider the actor's *skill* or ability to perform the action in a way that yields the intended outcome.

Intentionality is not a necessary condition for attributions of responsibility (actors can be held responsible for accidental but controllable outcomes such as involuntary manslaughter), but intentionality will likely enhance perceived responsibility. For example, Malle and Knobe (1997) report a study that manipulated (a) *desire* in terms of whether Frank hates or likes George, (b) *awareness* in terms of whether Frank was aware he bumped into a blue BMW behind him, and (c) *belief* in terms of whether Frank knew the blue BMW was George's car. They found that perceived intentionality was highest when Frank hated George, was aware that he bumped into a blue BMW, and knew that George drove a blue BMW. However, perceived intentionality was not completely absent when some of these conditions were not satisfied.

When conceptualized in this manner, intentionality subsumes and adds precision to other concepts frequently discussed in the literature on responsibility. Most notably, Weiner's (1986) influential theory of responsibility emphasized the role of controllability, where controllability referred to whether an actor could have behaved otherwise. On the whole, people are more likely to attribute responsibility for controllable than uncontrollable actions. However, not all consequences of controllable behaviors are intentional. For example, people attribute less responsibility in the case of accidents or when an actor was coerced (Woolfolk et al. 2006). Therefore, intentionality serves a similar function as controllability, but adds specificity.

**Role and Status of Actors**. An actor's social role and status are important to responsibility judgments because they affect the norms and expectations that people use as the basis of comparison for an actor's behavior. For example, supervisors may be held responsible for their subordinates' behavior, but subordinates are less likely to be held responsible for their supervisor's behavior (Hamilton 1986; Schultz et al. 1987). People likely view these situations differently because the role and status of the actors affects their obligation and capacity to influence events (Malle et al. 2014). Additionally, actors' role and status also have direct influences on how people perceive behavior. People interpret ambiguous behavior as less wrong when it is committed by a high than low status actor because of halo effects that accompany high status (Polman et al. 2013;

see also Hollander 1958). However, people are more apt to punish unambiguously bad behavior committed by high than low status actors because they perceive highstatus actors' behavior as more intentional (Fragale et al. 2009). Thus, actor status and the obligations that accompany status can either attenuate or amplify responsibility.

**Characteristics of Events**. Although many models highlight rational components of responsibility judgments (e.g., causality and intentionality), evidence suggests that these judgments include biases as well. People appear to be motivated to hold someone accountable for larger compared to smaller transgressions (Alicke 2000; Walster 1966). Explanations for this effect are rooted in the instrumental value of punishing reckless behavior (Alicke 2000) and also point to people's inherent need to view the world as a just and predictable place (Lerner and Miller 1978). Cognitively, especially bad events can trigger motivated reasoning that can affect what people remember, what normative standards are salient, and how people process available information (Ditto et al. 2009).

One particularly vivid demonstration of bias in intentionality judgments is the "side-effect effect." The most commonly studied scenario describes the CEO of a company who is told that a new policy will either harm or help the environment. In either case, the CEO responds by saying that he only cares about increasing profits, not about the incidental side effect on the environment. However, participants who read the harm version indicate that the harm to the environment was intentional, whereas participants who read the help version indicate that the help to the environment was unintentional. This effect occurs even though the harm and help resulted from identical actions (Knobe 2003). It appears that the valence of events can influence the way people process available information and make judgments (Laurent et al. 2015).

## Consequences of Moral Responsibility

Moral responsibility judgments can have a variety of consequences. The previous section included discussions of how attributions of causality and intentionality, the status of the actor, and the severity of the outcome can all influence whether people judge someone morally responsible. This final section discusses two sets of consequences of moral responsibility judgments: (1) whether an actor is blameworthy or praiseworthy and (2) how they affect global evaluations of others.

**Blame and Praise**. The judgment of an actor as morally responsible for a harmful or helpful outcome is what drives the subsequent assignment of blame or praise (Alicke 2000; Malle et al. 2014; Mikula 2003; Pizarro et al. 2003b; Shaver 1985). In terms of blame, the impact of judgments of responsibility on blame often depends on the presence or absence of justifications or excuses (Alicke 2000; Malle et al. 2014; Mikula 2003; Shaver 1985). For example, even once an actor has been judged responsible for a harmful outcome, he or she may claim that the outcome either was, in fact, helpful (i.e., deny the harmfulness of the outcome) or that it served some broader helpful outcome (Shaver 1985). In either case, the responsible party attempts to avoid blame by reframing the harmful outcome. Whether or not these justifications are accepted by the perceiver will determine whether or not the judgment of responsibility will increase the level of blame is assigned.

Compared to blame, less theory and research has been devoted to assignment of praise. Attributions of responsibility also affect assignment of praise (Weiner 1995), but it is unclear how praise and blame might differ, especially in terms of the roles that justifications and excuses might play. One would assume that justifications or excuses for helpful behavior would be relatively rare, but people could offer justifications that attempt to call others' attention to evidence of their good intentions. Therefore, differences in how people assign praise and blame represent an important avenue for future research.

**Moral Judgment Dominates Our View of Others**. Trait inference is a fundamental process that underlies how people relate to one another. People routinely form impressions about actors' traits and stable tendencies based on observable behaviors (e.g., Heider 1958; Jones and Davis

1965). Judgments of moral responsibility are likely to play a particularly influential role in how people view others. Several research programs have converged on the idea that a two-dimensional structure can account for most social evaluations (e.g., Cuddy et al. 2008; Rosenberg and Sedlak 1972; Wojciszke 1994). One dimension reflects competence or ability including attributes of skill and intelligence (or lack thereof). A second dimension reflects interpersonal warmth or morality, including integrity and benevolence. These two components, however, do not appear to carry equal weight in determining people's global evaluations of others. Information relevant to morality, including judgments of moral responsibility, appears to have greater impact than competence (Brambilla et al. 2011; Leach et al. 2007). One reason why morally relevant information may dominate social inferences is that people are more apt to believe that behavior in moral contexts is less attributable to situational causes and is therefore more indicative of the person's disposition (Kim et al. 2004; Reeder and Spores 1983; Tannenbaum et al. 2011). For example, research on trust repair suggests that apologies that acknowledge misdeeds are less effective in the case of violations of integrity than competence (Kim et al. 2004, 2006). In short, shirking one's moral responsibilities is especially detrimental to how others view a person and perhaps also organizations (Bauman and Skitka 2012).

## Conclusion

Judgments of moral responsibility are a product of attributions of causality and intentionality and also reflect features of the actors (e.g., role, status) and actions (e.g., valence and magnitude of outcomes). Judgments of moral and nonmoral responsibility differ because moral judgments: (1) take on a distinct set of psychological characteristics (Skitka et al. 2005), (2) involve behaviors that violate or uphold fundamental moral concerns (Graham et al. 2013), and/or (3) involve a relational structure in which agents harm patients (Gray et al. 2012). Importantly, moral responsibility judgments determine who deserves blame and praise and ultimately influence how we view other people. Judgments of moral responsibility contribute to appraisals of moral character, which play a primary role in people's overall impression of others and willingness to form or maintain relationships with them.

## Synonyms

Affective motivation; Commitment; Ethical behavior; Expectancy; Motivation

## Definition

**Motivation** – The forces that energize, direct, and sustain individual behavior.
**Ethical Behavior** – The degree to which a behavior, decision, or performance outcomes conform to an organization's communicated ethical standards and espoused values.

## Introduction

The incidence of many high-profile corporate and public sector scandals over the past two decades has caused many to wonder why individuals continue to behave unethically despite the existence of rules, constraints, and expected consequences. While some ethical breeches clearly violate an organization's formal rules, others fall within a dangerous gray area. Within this ambiguous territory, those making unethical decisions may be doing so within the letter of the "organizational" law. Thus, it is clear that formal codes and rules alone are not enough to reliably produce ethical behavioral outcomes. Instead, formal systems must be combined with informal measures that address the broader set of motivational forces shaping group member behavior. Thus, the question becomes "what motivates ethical behavior?"

This body of work provides a foundation upon which the forces motivating ethical behavior in the organizational context can be explored. This chapter examines ethical decision-making and ethical behavior from a motivational perspective using motivational models that are prominent in the field of organizational behavior. Although work motivation and ethical motivation theories developed along different academic tracks, it is helpful to look at motivation toward ethical behavior from the perspective of theories of performance motivation. Variables identified in current performance motivation research are useful to use in the examination of ethical decision-making models, as each can inform further research and theoretical integration. In turn, this integration can lead to more holistic applications within organizations.

While there have been many attempts to define ethics, ethical behavior, and ethical decisions, there is no consensus on what is ethical and what is unethical. However, in the context of organizational decision-making, over time organizational leaders establish a structure or control systems that direct behavior and guide decision. Leaders generally start by identifying the national laws, regional laws, and local laws that are pertinent to their organizations. As work processes are developed, process procedures, work rules, and functional rules (e.g., accounting, human resources, finance, etc.) are established and codified into manuals. As needs change and external pressures change, ways to control the ethical breaches are exposed in many different ways. The control methods of choice have been codes of ethics, ethical guidelines, and codes of conduct either directly stating or suggesting what and what not employees should do in making decisions. In addition to these formal standards enforced by leaders, there are informal rules, communicated in the form of social norms, enforced by employees themselves. The set of formal rules is known as the organization's structure and the informal system of social control becomes one the bases of the organization's culture.

In addition to this bundle of process or behavioral control mechanisms, organizations also set up systems to monitor work and decision outcomes by establishing and communicating organizational values that should guide work in the

organization. The cultural equivalent of organizational values is the social values embedded in the culture of the organization. To cap off this system of control, the personal ethical principles and personal values to organizational members are added to the mix.

This chapter will explore the motivation of organizational members to comply with this bundle of behavioral directives, that is, what motivates them to follow these rules? Is the motivation to comply with work rules and procedures different than the motivation to behave ethically? When faced with conflict between work rules and outcomes and ethical codes and values, what factors explain and predict how employees will respond? Figure 1 shows a graphic representation to forces that affect employees' motivation to comply. For the purposes of this chapter, the terms ethical decision and unethical decision will refer to the degree to which a behavior, decision, or performance outcome conforms to an organization's communicated ethical standards and espoused values. This is in contrast to any specific universal or cultural standards of what is right and what is wrong.

## Motivational Approaches to Ethical Decision-Making

What motivates employees to follow known ethical principles when there is no expectation of "getting caught" for violation? Alternatively, what motivates organizational decision-makers to follow their own ethical codes that are in conflict with organizational standards, despite the expectation of being disciplined for noncompliance?

Motivation is the forces that energize, direct, and sustain individual behavior. As applied to ethical behavior, motivation:

1. Energizes people to act ethically or achieve ethical outcomes

**Motivating Ethical Behavior, Fig. 1** Compliance forces

2. Directs them to select ethical alternatives
3. Sustains moral intention or commits them to a moral course of action

There are a couple of approaches to studying motivation. Each of these approaches includes a number of related theories that attempt to explain individual motivation. Content or dispositional approaches seek to answer the question, what motivates individuals or what explains the variability across different individuals performing in the same situation? Content theories, such as McClelland's (1961) manifest need theory, answer this question by using the concept of individual needs and the idea that the dispositions and needs of individuals vary from one employee to another. Content theories are best used to explain what energizes behavior. The sources of motivation model (Leonard et al. 1999) encompasses many of these theories to provide a content model that explains differential responses to ethical conflicts.

Another method of explaining motivation is to examine the processes that individuals use in making decisions among behavioral options. Process theories are based on the assumptions that variance in individual motivation can best be explained as a cognitive decision-making process. These approaches are called process theories or cognitive theories and include decisional balance theory, goal setting theory, control theory, and expectancy theory. Cognitive theories are based on the premise that motivation is goal directed and they explain how individuals make choices among behavioral alternatives. Behavioral choices are made based on expectation of achieving a set of personal goals; thus, individuals make rational choices among behavioral options based on the perceived consequences of each option. Finally, process theories posit that motivation is situationally specific, based on changes in circumstances, and therefore that motivation is not a dispositional variable. Expectancy theory (Porter and Lawler 1968; Vroom 1964) is often cited as an exemplar of process models and is useful to explain the motivation of ethical behavior.

Since cognitive motivational models explain a behavioral choice process and motivation and behavioral decision-making are so closely aligned, individual motivation and individual decision-making will be used as the same process. When discussing an individual's choice among behavioral alternatives, the terms "ethically sufficient" and "ethically insufficient" describe alternatives that do and do not satisfy the ethical standards established by an organization.

One of the newer approaches to studying motivation, the affective approach, analyzes the way in which the intensity of and direction of affect within emotional states influences human motivation.

Finally, the question of what sustains behavioral choices over time and how this affects ethical behavior can be explained by theories of organizational commitment (Meyer and Allen 1991). Commitment theories can explain the continuance of behavioral patterns or attachment to courses of action.

## Attitudes, Values, and Behaviors

The concepts of attitudes, values, and behavior are fundamental to the understanding of motivation. One of the most common variables in the social sciences, the concept of attitudes, has many different meanings and usages. The definition of an attitude most commonly used is an individual's mental position or behavioral predisposition toward an object. Attitudes are complex collections of feelings, beliefs, and expectations concerning the people, organizations, and things we encounter. Using this conceptualization, attitudes are composed of four distinct components: cognition, affect, behavioral intention, and evaluation. The cognitive components of an attitude are beliefs, theories, expectancies, cause-and-effect beliefs, and perceptions relative to the focal object. The affective component refers to feeling with respect to the focal object such as fear, liking, or anger. Behavioral intentions are goals, aspirations, and our expected responses to the attitude object. The last component of attitudes is the evaluation which is often considered the central component of attitudes. Evaluations consist of the imputation of some degree of goodness or badness of an attitude object. When referring to a

**Motivating Ethical Behavior, Fig. 2** Expectancy theory components

positive or negative attitude toward an object, we are referring to the evaluative component. Evaluations are function of cognitive, affective, and behavioral intentions of the object. It is most often the evaluation that is stored in memory, often without the corresponding cognitions and affect that were responsible for its formation.

Whereas attitudes are focused on objects, people, places, or things and are often changing and even unstable, values are relatively stable representations of the relative importance of ideas and end states. Several motivational models used to explain ethical behavior integrate the concept of values.

## Expectancy Theory

Expectancy theory is one of the most used and cited theories of process or cognitive-based motivation (Porter and Lawler 1968; Vroom 1964). As a process theory, it is used to explain an individual's choices among behavioral alternatives by utilizing the concept of motivational forces (MF). The motivational force is a combination of two individual attitudes, or perceptions, and one individual value. The first individual attitude is called the expectancy perception and is an individual's perceived belief that increased effort will lead to higher levels of performance as defined by managers. The other individual attitude is the instrumentality perception. This represents the perceived likelihood that resultant performance will lead to desired rewards. Finally, valence refers to the relative importance, or value, employees give to expected rewards.

The motivational force is represented by the model depicted in Fig. 2.

In terms of a simple behavioral decision, an ethical conflict occurs when individuals are faced with at least two alternative behavioral paths, one path satisfying ethical standards and the other violating them. In viewing an ethical conflict from an expectancy theory perspective, the alternative with the highest MF would theoretically become the alternative chosen for action (Fudge and Schlacter 1999). Expectancy theory is a useful framework for identifying and isolating specific factors motivating ethical or unethical behavior. An analysis of the factors shaping expectancy, instrumentality, and valence for ethically sufficient behavioral paths and comparing them to the motivational forces of competing ethically insufficient alternatives may reveal the motivational bases of the choice. The following sections of this chapter explain how individuals determine the various motivational forces for the various behavioral alternatives under consideration. In presenting this explanation, the many reasons why an ethically acceptable path may or may not be selected.

### Bounded Rationality

Bounded rationality means that decision-makers do not, and really cannot, consider all decision options or potential problem solutions. When developing a set of alternatives, decision-makers consider only a select set of many possibilities

(Simon 1957). The first stage in descriptive process models of ethical decision-making is generally recognition of a moral issue. Rest (1986) presents a four-stage model beginning with (1) recognition of the moral issue, (2) making the moral judgment, (3) establishing moral intent, and (4) engaging in moral behavior. In a similar sense, many organizational decision-making models start with the problem recognition stage. Decision-makers scan their environments looking for information informing them that there are performance gaps between desired organizational outcomes and actual outcomes. Identification of a gap triggers an initial decision as to whether this gap represents an actual problem, subsequently initiating a problem-solving process when affirmed. This stage is often called the contemplation stage.

Decision-makers in the contemplation stage take many variables into account when examining the performance gap such as what stakeholder groups are affected negatively by the gap. Mitchell et al. (1997) postulate that decision-makers are more likely to consider the interests of a stakeholder when it is perceived to be powerful, legitimate, or requiring urgent attention. Stakeholders that are viewed as powerful and as legitimate are called dominate stakeholders. Those that are legitimate with no substantial base of power or influence are referred to as discretionary stakeholders. When discretionary stakeholders are not considered to be relevant in this stage, there is little likelihood that problem solutions will incorporate satisfaction of the needs or interests of members of this group. When a group with little power is adversely affected by corporate decision, it can ignite a public outcry which is framed as an ethical issue. From an ethical decision-making perspective, two factors significantly influence the recognition of issues and identification of relevant stakeholder groups: moral awareness of the decision-maker (Tenbrunsel and Smith-Crowe 2008) and the moral intensity of the issue (Jones 1991). For this stage, it is the magnitude of consequences facing those involved, the degree of social consensus among the public at large regarding just treatment of this population, the probability that inaction (or a considered problem solution) would affect this group, the temporal immediacy of the issue, the proximity of the group to the decision-maker, and the concentration of the group's problem.

Several factors limit a decision-maker's recognition, or consideration, of behavioral alternatives or problem solutions. There is a natural tendency, especially among leaders, to reduce the complexity of decisions by eliminating or reducing options that would complicate considerations (Messick and Bazerman 1996). Additionally, decision-makers are less likely to recognize moral intensity in issues affecting people or groups from cultures other than their own (Craft 2013). Moral disengagement, when decision-makers cognitively minimize their role in organizational decisions and their effect on others (Tenbrunsel and Smith-Crowe 2008), can further limit a person's ability to recognize and consider significant alternatives or solutions.

### Expectancy and Ethical Behavior

Expectancy is the decision-makers' perceptions that they can properly implement the plan, meet the expectations of others, or carry out a chosen task. This is largely a function of the individual's self-efficacy, task or behavior difficultly, or his or her control over elements needed to manage the outcome. In summary, the expectancy is the individual's perception that she or he has the ability to produce a desired outcome. In ethical decision-making terms, this has been referred to as the locus of control (Lehnert et al. 2015). The orientation of an individual's locus of control can help explain how two individuals who value an ethical behavior equally could experience varying levels of motivation to pursue that behavior. For instance, individuals with an external locus of control may experience less motivational force in pursuit of ethical alternatives because they do not believe their efforts could lead to the performance needed to effect ethical outcomes. On a separate spectrum, individuals with an internal locus of control may still lack the motivational force to purse ethical outcomes, despite their confidence that they could achieve desired performance, because they do not trust that performance will lead to desired rewards. Fudge

and Schlacter (1999) argue that a part of developing self-efficacy as a problem-solving skill is through the observation of effective behavior in similar situations or through formal training.

### Instrumentality and Ethical Behavior

Instrumentality – the belief that rewards directly result from performance – is a function of trust, control, and policies. Instrumentality is strong when (1) an individual has *trust* in those in the position to distribute rewards based on performance, (2) an individual has some level of c*ontrol* over how rewards are distributed, and (3) there exist *policies* that properly reflect and/or regulate the relationship between performance and rewards. Managers seeking to promote ethical performance can tie highly desired rewards closely to desired performance.

As expectancy theory developed over the years, scholars realized that an important part of work motivation was the intrinsic rewards and other positive outcomes directly derived from performance. Unlike the use of extrinsic rewards, like pay increases, which require distribution by someone in a leadership role, intrinsic rewards are rewards people give themselves. When the rewards being sought are intrinsic, the instrumentality component is not relevant since there is no uncertainty as to whether performance will lead to rewards. Instead, the expectancy perception directly links effort to reward and becomes the perceived likelihood that effort will lead to the intrinsic reward. Any rewards for ethical behavior or developing an ethical solution often come from satisfaction one finds in doing the right thing (see entry "Sources of Motivation").

Since the 1980s, when companies were required to monitor and report on ethical violations, organizations moved to using control approaches with extrinsic rewards to motivate ethical compliance. These systems generally are developed through a three-step process consisting of first establishing rules, codes, or other behavioral standards. The second step is to clearly communicate these standards to all employees. The completing step is to establish a monitoring process to ensure compliance with the new behavioral standards. The monitoring process ranges from incorporating standards into the firm's performance appraisal system, establishing behavioral audits, developing employee reporting and whistle-blowing systems, creating ethical committees or judiciary boards, and establishing reward and sanctions (Lindsay et al. 1996).

### Valance and Ethical Behavior

The valence of the outcome of a decision or problem-solving alternative is the value that the decision-maker places on the expected outcomes. Most decision alternatives comprise more than one outcome, so the valance for an alternative path of action is the sum of the valences of each outcome. Outcomes, also known as rewards to a decision-maker, can be extrinsic rewards that are distributed by supervisors or intrinsic rewards coming from the satisfaction of task accomplishment. Outcomes can also have positive valances, attractive rewards, or negative outcomes that are viewed as penalties.

There are many factors that contribute to an individual's determination of reward valence. First and foremost is the individual's personal value set consisting of instrumental and terminal values. Values, such the importance of financial and career success, environmental ecology, justice, recognition, and customer safety, go into the reward outcome valance determination. Two different decision-makers in the same decision scenario are likely to construct different outcome valances because their value sets are different. When value sets are relatively similar, as might be the case in a strong organizational culture, there is more likely to be high consensus among decision-makers. Along with the socialization effect of organizational culture on values and thus outcome valances, nationality, ethnic, and racial cultures have been shown to influence the valance attributed to outcomes and rewards.

### Expectancy Theory and Ethical Behavior

Overall, employees are likely to choose the behavioral path that, for them, has the highest motivational force. The important question is whether the alternative with the highest motivational force is likely to be ethically sound. Employees are often faced with multiple paths to performing a task.

Some of the paths can be ethically sufficient, while others can be ethically insufficient. Sometimes the ethically insufficient alternative has the highest motivational force from the employee's perspective leading to an ethically insufficient behavioral decision. What follows are some of the many reasons why the ethically sufficient has a lower motivational force then the ethically insufficient choice.

The first set of issues occurs when the criteria used to reward performance are based solely on task accomplishment. If an ethically insufficient option is faster and leads to task accomplishment more effectively than the ethically sufficient option, an employee whose performance is evaluated by the quantity of tasks accomplished will perceive the ethically insufficient path as having higher expectancy. Likewise, the instrumentality will be higher for the unethical option if the resultant performance is the basis for a highly sought after promotion.

Low moral reasoning skills account for another expectancy perception-related issue. This refers to situations in which employees do not have the required knowledge and skills to achieve expected performance goals at the same time following ethical standards. Employees also may be in positions where they are looking directly at the needs of two or more stakeholders. Satisfying the needs of the dominant stakeholders is highly rewarded by the company, and satisfying the needs of discretionary stakeholders is rewarded less or not at all. When forced to make the choice between the need satisfaction of a dominant stakeholder and the need satisfaction of discretionary stakeholders, under this scenario most employees would pick the former because they lack the skills to visualize any other choice. If they had developed the skills to creatively design solutions that satisfy the apparent conflicting needs of multiple stakeholders, their low expectancy could be reduced.

There are also a number of issues leading to an employee perception of low instrumentality. For example, employees may believe there are few or no negative consequences for violating ethical standards. Even if there are negative sanctions for violation, they may be perceived as minor compared rewards associated with advancement and promotion.

Looking at valence issues, it is often the case that the valance of the extrinsic rewards for good performance in terms of task accomplishment outweighs the intrinsic satisfaction gained by validating one's set of internal values.

## The Sources of Motivation Model

The sources of motivation model was developed to integrate a large number of content motivational models including need models, intrinsic versus extrinsic motivation models, and theories of inducement and organizational involvement (Leonard et al. 1999). According to this model, there are five basic sources of motivation. Some of them may reinforce one another, while others may be in conflict with one another, potentially leading to interpersonal conflict. When individuals are motivated by more than one source at a given time, the theory proposes that individuals have a dominant source of motivation which generally is activated in situations of intrapersonal conflict. The five sources are as follows.

### Intrinsic Process Motivation

Intrinsic process motivation can be said to be the purest form of motivation. Individuals are motivated solely by the pleasure of the task itself. When individuals are motivated by intrinsic process motivation, they are energized by the need for pleasure and arousal, directed to select options they believe will be enjoyable, and sustained in this behavior by continual pleasure.

It is not common that this source motivates ethical behavior mainly because doing the right thing can create pleasure when the task is completed, but it does not always involve tasks that in themselves are pleasurable. In fact, when faced with the choice between an option that is expected to be pleasurable and one that has a high probability of aligning with ethical standards, it is the pleasurable option which is chosen by intrinsic process dominants. Actually, this source of motivation is often conflicting source to other sources aligned with ethical behaviors. However, since

this is not a dominant source of motivation for most working professionals, it is not often the source of ethical dilemma.

### Instrumental Motivation

Instrumental rewards are a motivating source when individuals believe that the behaviors in which they engage will lead to certain valued outcomes such as pay, promotions, and benefits. Rooted in exchange theory, the basic assumption is that individuals and organizations constitute an exchange relationship. Expectancy and equity theories are currently accepted models of motivation based on exchange relationships.

Instrumental motivation energizes behavior by the need or desire for extrinsic rewards, usually financial rewards, directs behavior toward the behavioral options with the greatest likelihood for high rewards, and sustains continuity of this choice through continuation of these rewards.

If a work team is composed of a high percentage of members whose dominant source of motivation is instrumental, then this source of motivation might be in conflict with making more ethical choices. However, an organization can use this source of motivation to its advantage by clearly identifying desired ethical behaviors and by providing rewards for compliance and penalties for noncompliance. The best practice for this approach is to include employee training in moral reasoning, clearly identifying desired behaviors, making the path between behavioral choices by employees and desired ethical outcomes very clear, and providing desired rewards for compliance (Fudge and Schlacter 1999).

### Self-Concept-Based Motivation

The self-concept is central to many models of motivation. One concept that has gained prominence is identity-based moral motivation (Mayer et al. 2012; Treviño et al. 2006). This is a specific type of self-concept motivation in which the prominent aspect of the individual's self-concept is a set of personal values that the individual uses as a basis for decision-making and exhibiting behaviors. Behavior that contradicts a person's set of moral values creates cognitive dissonance which the person is motivated to reduce.

For the purpose of the self-concept-based model of motivation described here, one's concept of self is composed of four interrelated self-perceptions: the perceived self, the ideal self, one's self-esteem, and a set of social identities. Each of these elements plays a crucial role in understanding how the self-concept relates to energizing, directing, and sustaining organizational behavior. Over time, through a host of lifetime experiences, people develop two important variables associated with their self-perceptions. The first is the level of one's perception of various traits, competencies, and values. For example, a particular person might perceive that he is an excellent carpenter and he ranks himself in the top 10% of carpenters (competency). Another person might see herself as a very honest (value) person, more honest than most people with whom she associates. Someone else could view himself as a person who is more often than not late for an appointment or event (trait). The other self-perception variable is strength. This is an assessment of how strongly individuals hold their views of self-perception level. A strong self-perception indicates that people are relatively sure of their traits, competencies, and values. A weak self-perception, also known as low self-esteem or self-efficacy, is indicative of uncertainty and insecurity about their self-perceptions. Self-perceptions are continually being tested and/or strengthened by task reinforcement and social reinforcement. The source of feedback and affirmation is what differentiates self-concept external motivation from self-concept internal motivation.

One of the most important propositions from this theory is that the stronger one's self-perception of a trait, competency, or value, the weaker the self-concept-based motivation. People who are confident in their self-perceptions are not in need of internal or external validation to reinforce these beliefs, whereas people with weak self-perceptions, especially those with high and weak self-perceptions, are continually seeking external validation and exhibiting behavior that elicits approval from others.

### External Self-Concept-Based Motivation

When feedback and reinforcement confirms an individual's self-perception, the self-perception is validated or affirmed, thus strengthening the self-perception. Invalidation reduces the strength of the self-perception creating a gap between one's self-perception and socially and task-derived feedback. This gap results in a feeling cognitive dissonance with individuals are motivated to reduce. This reduction is most often accomplished by choosing behaviors that the individual believes are likely to increase the positive feedback from others or to increase the positive feedback through task feedback which is feedback obtained from observing actual results of performance.

Self-concept motivation is externally based when individuals are primarily other-directed. In this case, the ideal self is derived by adopting role expectations of their reference groups. Individuals whose dominant source of motivation is external self-concept based (externals) attempt to meet these expectations by behaving in ways which satisfy reference group members, first to gain acceptance, then to gain perception of worth to the group, and finally to gain high status. The needs, for acceptance and status, are similar to McClelland's (1961) need for affiliation and need for power. Self-concept externals are energized by a need for external validation, they select from the behavioral options they consider the most viable option to achieve this external validation, and they are sustained by social feedback validated acceptance, worth or value, and/or status or power.

With respect to ethical behavior, it is the value component of the self-perception that is the most important. When individuals hold a perception of a certain set of values, they behave in ways and make choices that demonstrate to others that they hold these values. For external self-concept individuals, it is important that others believe that they hold a certain set of values whether they actually hold these values or not. This set of values is known as public values or espoused values. Although individuals might not actually hold these values, that does not mean it is not important for others to believe they are strongly held as a means to gain acceptance, worth, and status. Public decisions, votes, speeches, and conversations all motivate self-concept externals to closely examine and monitor the meaning of their actions to others. Therefore, externals are motivated to behave in ways that are consistent with the cultural values of the organization's win which they operate.

### Internal Self-Concept-Based Motivation

Self-concept motivation will be internally based when the individual is primarily inner-directed. Internal self-concept motivation takes the form of individuals setting internal standards that become the basis for the ideal self. Individuals tend to use fixed, competing with one's self, rather than ordinal, competing with others, standards of self-measurement as they first reinforce perceptions of competence and later achieve higher levels of competency. This need for achieving higher levels of competency is similar to what McClelland (1961) refers to as a high need for achievement. The motivating force for individuals who are inner-driven and motivated by their self-concept is task feedback. It is important to these individuals that they themselves view their efforts as vital in achieving task results and that excellent task performance can be attributed to their ideas and actions. This reinforces their internalized traits, competencies, and values which validate their self-concepts. It is not important that others provide reinforcing feedback as is true for other-directed individuals.

Self-concept internals' motivation is energized by a need to affirm their strongly held variables and perceptions of skills and abilities. They select behavioral options that are likely to achieve desired outcomes through means of their skills and that are consistent with their strongly held values. If their values align with organizational notions of ethics, the resultant behavioral pattern is what Rest describes as moral motivation, which is the "degree of commitment to taking the moral course of action, valuing moral values over other values, and taking personal responsibility for moral outcomes" (Rest et al. 1999, p. 101).

### Goal Internalization

There are situations in which individuals internalize the missions of their organizations, empathize with the needs of a group of people or an individual, or shoulder an environmental cause. When this type of outcome is the focus of their efforts, goal internalization is their active source of motivation. Acts aimed at these goals are not valued to demonstrate to others their commitment to a cause or group, like self-concept externals, or to validate a personal attribute, like with the self-concept externals, and they are not motivated by the expectation of an extrinsic reward. Instead, they are motivated by a desire to help a group achieve its goals and the critical factor is whether or not the goal is achieved.

When the group with which employees identify is a dominant stakeholder of their organization, there is a strong likelihood that these employees will be motivated to behave in ways aligned with their company's ethical standards. However, when their stakeholder identification is with a discretionary stakeholder group, they are likely to perceive some of their decisions as ethical conflicts. If these ethical conflicts are resolved in favor of the discretionary stakeholder, the decisions could be viewed as ethical breaches by employers. They could also be viewed as what has been called pro-social rule breaking with is motivated by these employees' attempt to increase job performance and to help a discretionary stakeholder (Morrison 2006).

## Organizational Commitment

Organizational commitment is a variable describing the attachment of individuals to their organizations. While high job satisfaction can be a result of satisfying and rewarding work experiences, if job satisfaction declines, there may be nothing holding previously satisfied employees to their organizations. That is where commitment comes in; it is a force that holds people to their organizations despite growing dissatisfaction. While expectancy may build enjoyment, dedication, and identification with an organization during periods when work expectations are constantly being met, it is often the case that when expectations are unmet (dissatisfaction), employees begin to look elsewhere to meet their economic and professional needs. It is in this context that employees are often more motivated by personally held conceptions of right and wrong rather than organizationally established standards. When these moral philosophies conflict, the resultant behavior can be deemed unethical by the organization. Commitment forces are developed over time through investments, reciprocity, social identity, perceived lack of alternatives, and a need to justify past decisions (Scholl 1981).

Not only do people become committed to parties in a relationship, such as that between employee and employer, but also to courses of action, various stakeholder groups, and to causes and ideals. Commitment becomes a level of psychological attachment and identification with an organization, person, cause, or stakeholder.

When employees develop high levels of commitment to their employer, they generally have internalized the organization's goals and values, see themselves in a long-term relationship with the organization, and tend to exhibit high levels of extra-role behavior, often referred to as citizenship behavior or pro-social behavior. Organizational commitment has been conceptualized as having three components: affective, continuance, and normative (Meyer and Allen 1991).

Craft (2013) found that people reporting high commitment to their employers were less likely to engage in unethical behavior. Related research on highly committed people finds that they are less likely to engage in behavior that negatively affects their organization's reputation. This is largely because of the intended long-term employment relationship, the fact that their social identity is so closely tied to the organization's reputation, and their normative commitment to the products and services of their firms.

### Investments

When people work toward a goal, put effort and time into attempting to find a solution to a difficult problem, or spend time paying one's dues, they are investing in a course of action or a relationship. Once investments are made, people

generally expect some return on their investments. An investment is lost or sacrificed when actions in pursuit of a goal are halted prior to goal attainment. Likewise, investments are lost when a relationship is severed. Exceptions exist when investments made into a course of action or a relationship are transferable to another endeavor. Regardless, investments increase the likelihood that individuals will become committed to certain behavioral choices even when another potential action has a higher motivational force. This pattern of behavior, termed escalation of commitment, explains situations in which an individual continues to rationalize and invest in an ethically insufficient course of action despite growing likelihood of negative outcomes.

For instance, a property developer who has invested significant funds and work hours into a project is more likely to resist pressures to alter his or her course of action to address an environmental problem than one who has invested little and has little commitment to any one plan or course of action.

### Reciprocity

Based on the cultural norm of equitable exchange, reciprocity commits individuals to others when the individuals believe they have received disproportionately greater benefits than they, the individuals, have contributed. This perception often results in feelings of indebtedness. Individuals with felt indebtedness are more likely to make decisions that favor their benefactors. Thus, if the benefactor is an employer that values ethical outcomes, individuals are likely to behave in ways seen as ethically sufficient to the organization. If, however, the behaviors that produce organizational benefits are not ethically sound, reciprocity may incentivize immoral or amoral action.

### Social Identity

Social identity theory holds that people use social labels to define themselves such as occupations, work organizations, and various social causes. There are three characteristics of organizations that increase the likelihood of individual identification: (1) the distinctiveness of the organization's mission and espoused values, (2) the prestige of the organization, and (3) the organization's position relative to competitors and other firms of its type (Ashford and Mael 1989). Human resources practices that effectually validate employee competencies and worth to the organization also enhance the bond between an individual and the organization through the establishment of a shared social identity.

Individuals that are identified with organizations are defensive of their organizations and have a shared interest with the organization to maintain its distinctiveness and prestige and to defend it against its out-groups. Maintaining a reputation of honesty, concern for customer safety, and enhancement of worker rights are all part of establishing and maintaining a reputation of ethical conduct, a reputation that benefits both the socially identified employees and the firm.

### Perceived Lack of Alternatives

A perceived lack of alternative career paths can commit employees to their current employer or occupation. Employees with a very unique type of expertise often believe they have few alternative sources of employment, which binds them to their current employer or occupation. Depending on the type of behavior encouraged by the organization, the commitment obtained through this perceived lack of alternatives can motivate ethical or unethical acts. For instance, if employees believe they need to commit fraud in order keep them from unemployment (i.e., the fraudulent act is sanctioned by their superiors), they may be motivated to engage in this unethical behavior. Alternatively, if keeping one's job is dependent upon complete transparency with regulatory agencies, for example, a perceived lack of alternatives will motivate ethical behavior.

## Affective Motivation

For many years, both economists and behavioral scientists built decision-making and behavioral choice models on the premise that people in the

workforce operated without individual values or emotion. The calculative-cognitive models dominated the organizational behavior textbooks until the beginning of the twenty-first century. In the mid-1990s, a number of scholars began to question the complete rationality of organizational decision-makers by proposing models of affective motivation (Damasio 1994; Goleman 1995; LeDoux 1996). At the beginning of the century, organizational scholars began to integrate some of these ideas into the mainstream organizational literature. So far, there are few theories that combine cognitive models with affective models or even an integrated theory of affective motivation. This section presents the main ideas and principles of this line of research and applies it to the motivation of ethical behavior.

In introducing the role that affect plays in decision-making, Loewenstein and Lerner (2003) argue that emotions affect decision-making in two important ways. Expected emotions are based on assessments of the likelihood of emotional reactions to future events. Immediate emotions are those that occur during the process of making a decision.

### Expected Emotions

The approach to studying the impact of future emotion on a current decision is based on Damasio's (1994) somatic marker hypothesis. According to his hypothesis, individuals develop a type of emotional memory called somatic markers. Somatic makers are links between an event and the affective state (see Fig. 3) of an individual at the time of that event. Based on past experiences, these markers are attached to people, places, events, and other mental representations as an emotional cue. When decision-makers are processing alternatives, they consider alternatives both on a conscious, or calculated basis, and on an often subconscious emotional basis. As the somatic markers associated with all or part of a decision option is stimulated, a physiological-based emotion is invoked. If this emotion is unpleasant, decision-makers might reject a course of action and not really know why. Alternatively, a pleasant reaction might sway decision-makers toward acceptance of that option.

Bazerman et al. (1998) argue that individual behavioral choice is the product of multiple

**Motivating Ethical Behavior, Fig. 3** Core affect model. (Source: Based on Seo et al. (2004, p. 426)

selves. The "should self" evaluates alternatives on the basis of rational, cognitive, thoughtful, and cool-headed analysis. The alternative evaluation process of the "want self" is emotional, affective, impulsive, and hot headed. In any behavioral decision, the actual choice of an alternative action is made right before the action is implemented, but the evaluation process can start long before the actual final choice. During this evaluation process, the should and want selves are in constant debate, often changing the intended behavioral choice many times along this path. Bazerman and his colleagues suggest that there are a number of variables that determine the relative influence of the should self or the want self. One of these variables is the timing relative to the actual decision in that the want self is often more influential at the time of the decision.

When the want self dominates, it could have one of two influences on ethical behavior. In one case the choice between logical adherence to a company and responding to the emotional appeal of a discretionary stakeholder could result in an ethical breach – from the company's perspective – if the want self motivates an individual to decide in favor of the discretionary stakeholder. On the other hand, this decision may be seen as more ethical to broader stakeholder groups.

### Immediate Emotions

Another idea gaining acceptance is the concept of the core affect (Russell 2003; Seo et al. 2004). This concept takes the two affective states of unpleasantness and pleasantness and places them on opposite ends of a horizontal continuum. It then puts the variable of energy level on a vertical continuum anchored by the energy levels of activation and deactivation. The resultant model yields four quadrants.

Gaudine and Thorne (2001) point out that most of the prior ethical decision-making research is based on a cognitive-rational perspective, and there is a need for an integrative cognitive-affect approach. Using Rest's (1986) basic model of ethical decision-making, they demonstrate how the two affective dimensions of feeling state and arousal can influence each of Rest's stages of ethical decision-making.

Still in the category of immediate emotions is the theory of emotional hijacking (Goleman 1995). The basic model holds that individuals are subject to emotional triggers in their everyday lives. The triggers first can be evoked by anything people experience, for example, a comment in a conversation, an email message, or even a simple look from someone. A trigger may or may not set off the second stage with what is called the emotional response. If activated, the emotional response is actually a physiological reaction that we interpret as anger, sadness, joy, or any number of other strong reactions. If unchecked, the emotional response may trigger an immediate behavioral response such as angrily yelling at someone, storming out of a room, or quitting a project. The point is that little or no conscious or deliberate thought goes into the behavioral reaction. There are individual differences in the way people experience triggers, the effect these triggers have on emotional reactions, and the ability to prevent the escalation of emotional responses into behavioral responses.

There are many types of ethical breaches that are a direct result of emotional hijacking. For example, public officials involved in sex scandals often experience an element of emotional hijacking. This is one of the reasons so many organizations teach employees variants of emotional training that helps them to develop skills, to recognize their triggers or hot spots, and to practice avoiding transition from trigger to emotional response and ways to control emotional responses so as to keep them from developing into behavioral responses.

## Conclusions and Integration

Understanding what motivates behavior deemed ethical or unethical is essential for organizations interested in preventing ethics violations or in optimizing performance through an ethical culture. To do this, organizations must explore how employees make decisions to pursue courses of

action and behaviors and the degree to which they consider ethical issues throughout this process. More specifically, it is important to explore what energizes behavioral choices, what forces direct this behavior, and what sustains these decisions once made. The literature establishes clear parameters for this analysis. Personal and organizational goals often activate the need for an individual to choose a behavioral path to reach these goals. The behavioral path chosen is limited by their knowledge, skill level, experiences, organizational prescription of allowable options, and their creativity. Their ability to follow the path chosen can be constrained by organizational rules, procedures, social norms, ethical codes, and personal ethical principles. The intensity, direction, and duration of an employee's journey down this chosen behavioral path are the visible elements of motivation. These factors, as well as the preceding choices and goals pursued, are influenced by the source of their motivation. Organizational members can source their motivation from the pleasure they derive from a task or process (intrinsic process motivation), the expectation of certain rewards (instrumental motivation), the need to reinforce an internally held self-image (self-concept internal), the desire to reinforce or shape an externally held perception of the self (self-concept external), or the desire to see a goal be accomplished (goal internalization). Once an organization understands how employees source their motivation to choose and follow certain ethically related behavioral paths, efforts can be made to better align incentives and controls, policies, management strategies, and rules. There is no one-size-fits-all method to motivate ethical behavior. However, a thorough understanding of the dynamic forces shaping an employee's ethical decisions can contribute significantly to an organization's ability to motivate employees in the direction desired.

# Motivation and Governance

Md. Mansur Hossen
Centre for Administrative Research and Innovation (CARI), University of Dhaka, Dhaka, Bangladesh

## Synonyms

Actors; Administration; Good governance; Governance; Motivation; Participation

## Definition

Governance is the process of decision-making and the process by which decisions are implemented or not implemented.

Motivation is the process that account for an individual's intensity, direction, and persistence of effort toward attaining a goal.

## Introduction

Motivation and governance are closely related. Without motivation, Governance may face multiple crises. Motivation explains peoples' behavior in a certain situation. It is therefore important to understand what induces individuals to work in what way. It gives the reason for people's actions, desires, and needs. Performance of any organization depends on the performance of the employees, and the performance of employees depends on the level of motivation. Governance is the process of decision-making and the process by which decisions are implemented or not implemented. There are various dimensions of governance. The focus of the paper is the relationship of motivation with public governance. Motivation has a great role in ensuring good governance. Good governance urges people's participation, accountability, and transparency of the administration along with rule of law to run the affairs of the governance. The opportunity of participation in public decision-making makes the stakeholders more powerful. Stakeholders involve themselves in policy formulation and implementation and contribute to ensure good governance.

## Background of Governance and Public Governance

World Bank introduced the term "governance" through its report titled "Sub-Saharan Africa - from crisis to sustainable growth" when the economic performance in the region worsen despite the Structural Adjustment Programs. The report recommended institutional reform and a better and more efficient public sector in Sub-Saharan countries. In 1992, the World Bank developed the concept "Good Governance" in the report titled "Governance and Development." World Bank defines good governance as sound governance

with sound public sector management, free flow of information, justice, respect for human rights and liberty, transparency, accountability, and rule of law. Rampant corruption, absence of human rights, nepotism in public sectors, political violation, and absence of free and fair election accelerated the urgency of good governance throughout the world.

## Governance Process

The term governance is more rhetoric than empirical. Since early 1980s, Governance has emerged as a popular term in development literature. Nevertheless, a consensus on definition is elusive. Governance is defined as the "system of government concentrating on effective and accountable institutions, democratic principles and electoral process, representation and responsible structure of government, in order to open and legitimate relationship between the society and the state" (Haalfani et al. 1994, p. 4). In general terms, Governance denotes "how people are ruled, how the affairs of state are administered and regulated as well as a nation's system of politics and how these function in relation to public administration and law" (Mills and Serageldin 1991, p. 304).

Governance can also be defined as "the manner in which power is exercised in the management of a country's economic and social resources for development" (World Bank 2000). Governance is assessed by scholars from three dimensional perspectives. Such as:

- The process by which government is selected, held accountable, monitored, and replaced.
- The capacity of government to manage resource efficiently and formulate, implement, and enforce sound policies and regulation.
- The extent of participation of the citizens in the affairs of the state.

Hyden (1992, 2007) evaluated governance to an umbrella concept to define an approach to comparative politics. He summarizes five characteristics of governance as:

- A conceptual approach that when fully elaborated can frame a competitive analysis of macro-politics.
- Concerns "big" questions of a "constitutional" nature that establish the rules of political conduct.
- Involves creative intervention by political actors to change structure that inhibit the expression of human potential.
- A rational concept, emphasizing the nature of interaction between state and social actors, and among social actors themselves.
- Referring to particular types of relationships among political actors: that is, those that are socially sanctioned rather than arbitrary.

Governance thus viewed as the sum of three major components of: process, content, and delivery. The process of governance includes factors such as transparency and accountability. Content includes values such as justice and equity. Governance cannot be all process and values. It must ensure that the citizens, especially the poorest, have the basic needs to fulfill and no doubt better than a dictatorship that does not, but it is not good governance. Similarly, regular elections alone do not translate into "good governance." It is only when all these three conditions are fulfilled that governance becomes "good governance."

The sum of the many ways individuals and institutions, public and private, manage their common affairs. It is a continuing process through which conflicting or diverse interest may be accommodated and co-operative action may be taken. It includes formal institutions and regimes empowered to enforce compliance as well as informal arrangement that people and institutions either have agreed to or perceive to be in their interest (Our Global Neighborhoods: 1995).

## Indicators of Governance

Good Governance is a normative conception of values according to which the act of governance is realized, and the method by which groups of social actors interact in a certain social context.

The concept of good governance emerged mainly because practices of bad governance, like corruption, unaccountable governments, lack of transparency in public sector, absent of rule of law, lack of respect for human rights, had become increasingly dangerous and need to be intervene. Good governance which was used for the first time as synonym of normative governance is epitomized by predictable, open, and enlightened policy making; a bureaucracy imbued with professional ethos; an executive arm of the government accountable for its action; and a strong civil society participating in the public affairs; and all behaving under rule of law (World Bank Report 1993). Bilney defines good governance as "means of the effective management of a country's social and economic resource in a manner that is open, transparent, accountable, equitable" (Bilney 1994, p. 17). Good governance has become an important element of economic and political agenda. The main purpose of governance is to ensure good governance and the better performance of the employees of the organization ensures good governance of that organization. There are some basic indicators of good governance like participation, rule of law, transparency of decision-making, accountability, predictability or coherence, and effectiveness.

## Participation

Participation is the key element of good governance. It includes equal participation of all the members of society in the process of decision-making. Good Governance requires that the general people has the opportunity to participate during the formulation or design of development policies that affect the communities or groups and able to contribute in the implementation of programs and projects. Even where the policy has minor impact on society, the administration should take the opinions and views of the people. This participation may occur at various level like at the grass root, local government, and regional and national levels through flexible and decentralized form of government. Such participation motivates the people to implement the policies more efficiently and effectively.

## Transparency

Transparency in decision-making or public policy making, especially in budget, regulatory, and procurement processes, is also important to the effective use of resources and reduction of corruption and waste. Access to information is the precondition for ensuring transparency. Information should be made available to the general people and there should be clarity as to rules and regulations. Access to timely information on different problems and services of administration motivate the external actors of organization to involve in the governance process. So, the policies, programs, and projects of the government should be transparent as general people can easily get their desired information.

## The Rule of Law

A predictable, stable, and fair legal framework is important so that individual can easily grasp all sorts of opportunities given by the governance without any fear of arbitrary interference and exploitation. This requires that the rules be known in advance, that it can be equally forced and applied consistently and fairly. Legal framework of the government should be fair and enforced impartially irrespective of caste, creed, culture, and religion. There is a crisis of trust in governance. No can rely on the present governance system because of lack of trust. If the governance can ensure rule of law, the level of trust of external actors will increase. Higher level of trust on governance will motivate the actors to involve in governance process.

## Accountability

Along with transparency and responsiveness, accountability is one of the core components of good governance. Accountability means

answerability, i.e., having obligations to answer questions regarding decisions or actions. In general, accountability involves the power of one actor (internal or external) to make demands upon another to provide information about, or justification for, his/her actions and the composition of the actor subject to those demands to respond. There are different forms of accountability such as: horizontal and vertical, democratic, market and administrative. In governance process, all forms of accountability are important, particularly administrative accountability. Public officials should be answerable for the government behavior and responsive to the entity from which they derive authority. It is all about making the authority accountable to the actors of governance. Accountability of public officials will make the governance more transparent and motivate the actors to involve in the governance process.

## Equity

Equity is also an important pillar of good governance. To ensure social justice, equity is must. All men and women should have equal opportunity to maintain or improve their pattern of livelihood irrespective of caste and creed.

## Predictability

Predictability is another important element of good governance. Predictability indicates that laws and policies should exist that regulate society and that are applied fairly within the society. Predictability requires that the governance and its actors are answerable to the legal authority as private enterprises and individuals.

## Combating Corruption

Corruption is an epidemic of modern capitalist world. It has taken place in every sphere of public life. Corruption is the private use of public property. There are various reasons of corruption. Motivation of the employees has a close linkage with corruption. The salary scale of public official of developing countries is not up to the mark. As a result, they are not positively motivated to perform their work effectively and efficiently. So, the qualities of public services are deteriorating day by day and the public sectors are making a huge lose. As a result, combating corruption has become an important element of good governance. The level of corruption depends on the level of motivation. If corruption exists in every segment of public life, then the general people will be demotivated to participate in the governance process. On the other hand, if the motivational level of line and staff within the organization is not satisfactory, the overall performance of the organization will be decreased.

## Efficiency and Effectiveness

Efficiency and effectiveness is also a key indicator of good governance. Efficiency means how promptly the service can be delivered with less time and cost to the citizens. On the other hand, effectiveness indicates how perfectly the service can be delivered with the stipulated time frame. When the mechanism of an organization provides services to the stakeholders efficiently and effectively, they feel motivated and thus they involve themselves in the governance process.

From the above discussion, it is seen that the element of good governance has close linkage with motivation. Participation, accountability, responsiveness, rule of law, transparency, combating corruption, efficiency, and effectiveness motivate the actors (internal and external) to involve in policy formulation and implementation. Participation also ensures the highest level of commitment and dedication. So, to ensure good governance, the motivation is an essential factor that accelerates the performance of public sectors.

## Governance and Motivation

Motivation of stakeholders of an organization is an important factor of the success of the organization. The word motivation derived from the

word "motive" which means needs, desires, wants, or drives within the individuals. It is the process of stimulating people to actions to accomplish the goals. According to Stephen P. Robbines, "Motivation is the process that account for an individual's intensity, direction, and persistence of effort toward attaining a goal." There are three elements of motivation, such as

(i) **Intensity:** The amount of effort put forth by the stakeholders to meet the need of the organization.
(ii) **Direction:** It includes efforts that are channeled toward organizational goals.
(iii) **Persistence:** It includes how long the effort is maintained.

The process of motivation begins with the need of individuals which comes from deficiency. For instance, employees of an organization demand higher pay for challenging job. This demand influences the thought processes of employee that directs him to satisfy the needs by adopting a particular course of action. If the selected job of the employee produces expected results, then obviously he will be motivated for the same job for the want of reward. On the other hand, if the anticipated results are not provided to the employee he would not be motivated to do the same performance further. Following are the basic phases of the process of motivation;

(i) Need identification
(ii) Exploring ways to fulfill the need
